Holland County Potato Show.—The seventh Holland County Potato show, of which the schedule has just been issued, will be held in Spalding, on Thursday, October 27. The show is to be opened by the Rt. Hon. the Marquess of Salisbury, K.G., and Councillor W. Gilding, Chairman of the Show Committee, will preside at the opening. Twelve cups are again offered for competition, ranging in value from ten to thirty-five guineas. An interesting class is that for one chitting tray of seed Potatoes, boxed for sprouting, for which a Challenge Cup is offered by Messrs. Knight Bros., Potato Merchants, Kings Cross. The prize money in this class is £3 3s. 0d.; first prize £2 2s. 0d.; second prize; £1 1s. 0d.

Brussels International Horticultural Exhibition.—A large, interesting and beautiful exhibition was held in the Grand Hall and Gardens of the Palais du Cinquantenaire, Brussels, from September 10 to September 18. Dahlias were the great feature, and large decorative sorts were those most in evidence from Belgian, French and Dutch growers. Palms and other foliage plants, Orchids, Coleuses, Begonias of the Rex type, fruits—particularly Grapes and Pears—and vegetables were also exhibited extensively in the fine, big, well-lighted hall. M. Eugene Draps and his committee are to be congratulated upon the success of their efforts. During the three first days of the show the attendance was large, notwithstanding the wet weather. Severe pressure upon our space prevents us from publishing further comments this week, but we hope to give an account of the show in our next issue.

A New Disease of Mushrooms?—In the issue for August 26 of our Berlin contemporary, *Die Gartenwelt*, a correspondent describes a fungus disease of Mushrooms which he believes to be a new one. The symptoms are a mass of

tuberous growths which cover the upper surface of the Mushroom and also the stem, giving the impression that a number of small Mushrooms have grown out of the large one. Those who have seen the diseased Mushrooms incline to the belief that the pest, which is undoubtedly of a fungous nature, was introduced with the manure or with the earth; that it attacks the Mushrooms when young, becoming obvious only when they are full-grown. Or it may be that it is introduced by the Mushroom fly, which it is almost impossible to exclude completely even from the cleanliest and best-managed establishments. We understand that the writer of the note, Herr A. Janson, of Eisenach, Germany, has material at his disposal which he can send to any research station interested.

Mr A. H. Holmes.—One of the most successful of present day exhibitors at the larger exhibitions held throughout the country is Mr. A. H. Holmes of the West End Nurseries, Chesterfield, who still exhibits under the name of his father,

MR. A. H. HOLMES.

Mr. William A. Holmes, who was an equally successful competitor in earlier years. Mr. A. H. Holmes was educated at St. Thomas' School, Chesterfield, and after leaving school he joined his father in the nursery business. At such an early age as seventeen years he showed an aptitude for exhibiting groups of plants for effect, and the first effort made by himself was at Tibshelf. Mr. A. H. Holmes and Mr. J. Cypher are very keen competitors at shows in the large classes for groups of plants, both flowering and foliage, arranged for effect, and they usually share the two first positions between them. In some seasons Mr. Holmes may stage so many as twenty of these large groups and such exhibiting, to be successful, needs an iron constitution, infinite patience and genius for arranging plants in a highly decorative fashion. Although Mr. Holmes had not such a long record as his friend, Mr. J. Cypher, he should have a long period of success in front of him, as he is only forty-four years of age. In addition to managing the nursery and seed business, cultivating stove and greenhouse plants, and arranging big groups, Mr. Holmes is also a frequent exhibitor in classes for bouquets and table decorations, while as a judge of all these subjects his services are greatly in request. Mr. Holmes is also extremely popular among his fellow competitors, not only because he is a naturally cheerful person, but because he can take second place—as he has to on occasion—without telling all and sundry that the judges have failed to do him justice.

Horticultural Exhibition at Louvain.—A horticultural exhibition organised by the Provincial Horticultural School, took place at Louvain, Belgium, on September 4, in the ancient press-house of the St. Gertrude Abbey, which has been restored and scheduled as an ancient monument. The weather was superb, and a large number of visitors was attracted to the show, which included some excellent vegetables, a great many flowers, and some magnificent Melons, Apples and Pears. A number of local dignitaries attended the opening ceremony, and a presentation was made to the Principal of the Horticultural School.

Importation of Potatoes into Jersey.—The Ministry of Agriculture and Fisheries has been informed that the Committee of Agriculture of the Island of Jersey has prohibited the importation into the island of any Potatoes of varieties which are susceptible to Wart Disease. Consignments of immune varieties must be accompanied, as before, by a sworn statement by the shipper, indicating the farm where the Potatoes were grown, and declaring that no case of Wart Disease has occurred on the farm, and this statement must be supported by an official certificate that no case of Wart Disease has occurred during the past three years within a distance of at least 500 yards. Application for the issue of this certificate in connection with the export to Jersey of Potatoes grown in England should be made to the Ministry of Agriculture and Fisheries, 10, Whitehall Place, London, S.W.1. A charge of one shilling is made for each certificate issued.

Geneva Horticultural Exhibition.—The Cantonal Horticultural Exhibition, organised by the Genevese Horticultural Union, which is always a very popular event in Switzerland, will be held this year from October 21 to 24 in the Geneva electoral hall. Among new features this season there will be six special classes for Chrysanthemums. The President of the Organising Committee will be M. John Vachoux, whose portrait we gave in our issue of July 30, p. 32, and the other members will be prominent figures in Swiss horticulture and public affairs.

Evening Horticultural Instruction in London.—A series of talks and lectures on gardening is to be given by Mr. E. H. Chitty, on Wednesday evenings, at the Whittington Evening Institute, Highgate, N.19, commencing on September 28. In association with the lectures, work will be done on the demonstration plot at Parliament Hill Secondary School on Saturday afternoons.

The Utilization of Marine Algae.—An interesting article in the September issue of our contemporary, the *Revue Horticole Suisse*, by Professor Lendner, describes the collection of Algae on the sea-shores of Brittany and Normandy, where they are known under the collective local name of "goémon." This rather vague expression includes quite a number of different Algae, green, red and brown, of which the last are in the majority and comprise the genera Fucus, Halidrys, Ascophyllum, Laminaria, and Saccorhiza. The Algae are useful for a variety of purposes. They are even used for food in the Far East, where agar-agar is prepared from Gelidium corneum, and used as a corrective to the too starchy diet. In Japan, Asak sanori, or Porphyra tenera, is used for the same purpose; but in Europe, only the very poor inhabitants of Scandinavia use the Algae as food, unless their use in confectionery (as gelatine) be considered as bringing them within the category of foodstuffs. Certain species of Laminaria, Fucus, and Alaria are, however, used as fodder for animals, mixed with bran. This material was tried during the war as a feeding stuff for the horses in the French army, and the results were found satisfactory. Perhaps the most common way of utilising the Algae, however, is by burning the weed and thus freeing the valuable chemical properties which it contains, such as iodine, bromine, nitrogen, potash, phosphate and sulphate of calcium, soda, magnesium, iron and manganese. The burning is done in the simplest and most primitive way; the weed is collected, carried inland, and there left in heaps, until the rain has washed

away a good deal of the salt, and partial putrefaction has set in. The mass is then dried and spread thickly along the surface of a trench, which is dug previously and roughly bridged with slates at a little distance from each other, to ensure the circulation of air beneath the weed. It is then set on fire and allowed to smoulder, fresh weed being thrown on from time to time. When it is reduced to ashes, these are collected in sacks and sold to factories where the chemicals are extracted for commercial use. A good deal of the weed is, however, used in its natural state as a field fertiliser, and is considered one of the best. The deep-water Algae—which are known as "Goémon de fond"—are obtained from a boat, and are of superior quality; it is from them that a gum known as "algine" is obtained, which is used in the preparation of certain dress materials and hats, and also for binding coal dust in the preparation of briquettes.

Brighter London.—Bermondsey is doing splendid work in educating the inhabitants of this densely populated Borough of London to make the district more beautiful by planting flowers and trees wherever opportunity affords. It has a "Beautification" Committee which encourages the inhabitants of the poorer districts to cultivate their gardens, and those who have no gardens, to grow flowers in window boxes; in short, an effort to make London a more beautiful city than it already is. This Committee has only been in existence for a few years, but it has already done most valuable work; a flower, fruit and vegetable exhibition, held on the 8th and 9th inst., in the Town Hall, Spa Road, showed how successful have been the efforts of this Committee in stimulating a love of the beautiful in the Borough, for the whole of the large building was filled with creditable exhibits. At the opening ceremony, the Mayor of Bermondsey, Councillor George Catchpole, J.P., stated that there were over 600 local exhibits, as compared with 300 last year, and he proudly declared that no municipality in the metropolitan area could beat them, whilst they boasted that they had more street trees than any town in the world. The schedule included some eighty classes, the majority for plants and flowers, although some good vegetables were forthcoming, especially Red Cabbages, Parsnips, Beets, Tomatos and Beans. Mr. W. H. Johns, the Superintendent of the Public Parks, which were described in our issue of October 16, 1926, page 313, takes the keenest interest in the movement and he arranged a surprisingly good display of flowers from his department on a space measuring sixty feet by seven feet (Fig. 101). As will be seen on reference to the illustration, this was an exhibit worthy of any flower show, and he is to be congratulated on the excellence of the arrangement, especially as regards harmony of colour blending. The principal subjects shown by Mr. Johns were Dahlias, Gladioli, *Lilium speciosum*, Delphiniums, Pelargoniums, Marigolds, Coreopsis, with such foliage plants as Aralias, Maize, and *Kochia scoparia* for relief. Amongst the Dahlias he showed an apricot-coloured form of the Coltness Gem type, rather taller and freer than the well-known variety, named Bermondsey Gem. Messrs. H. J. Jones, Ltd., also showed Dahlias associated with Tritomas, Phloxes, Solidagos, etc., and Messrs. R. Neal and Sons, Ltd., had a splendid group of evergreen shrubs and another of Roses. Taken altogether the show was an earnest of the will of the people to respond to the appeal made to obtain a "Brighter London."

Aster-growing in the Ukraine.—The climate of the Ukraine, which is inclined to be hot during a fair proportion of the year, appears to be particularly suited to the growth of Asters, and to the development of new and improved varieties. One firm, Peter Lesewizky, has raised two new types of summer Asters. The "Comet" Aster, when grown in sandy soil, reaches a height of 70cm., with dark green, sappy foliage; the flowers somewhat resemble a Hercules Aster, and have been produced up to the present only in flesh tints. The second type, the Hohenzollern, produces a giant flower, greatly resembling a Chrysanthemum; the colours in this type are white, pink and blue.

Belgian National Centenary.—Although the centenary of Belgian Independence is still nearly three years hence—the country having been created an independent state in 1830—preparations are already on foot for celebrating the anniversary in a manner worthy of the traditions of the country. Everywhere associations are being formed to stimulate interest in the event, and to awaken in the inhabitants of the little country a desire to show it at its best to the inevitable influx of foreigners in 1930. The watchword of these societies is "La Belgique Fleurie en 1930," the idea being to display to the best advantage the horticultural proclivities of the people, and to decorate the entire country with flowers, from the railway stations and public buildings to the humblest cottage garden or tenement window. To this end, from 1928 onwards, the roads are to be put well into repair and planted so far as possible with fruiting and other ornamental trees; the railway embankments are to be tidied up and cleared of weeds; the untidy corners which in certain places disfigure the towns and villages are to be cleared, and kept clear; public buildings, such as schools, churches, hospitals, railway stations, etc., are to be

"Gardeners' Chronicle" Seventy-five Years Ago.—*The Manetti Rose.*—I ought to apologise to your readers for omitting to give the very simple management required to make this a healthy stock. For dwarf Roses, the cuttings should be made ten inches long, all the buds cut off but two at the top of the cutting; they should be planted deeply, so that the two buds are just above the surface, and suffered to grow one season; the following autumn or spring they should be taken up, the two young shoots cut off close to the stem and transplanted, previously removing with the knife all the roots on the stem, leaving only the tuft of roots at bottom, and planting them about three inches deep, leaving seven inches out of the ground; the following summer, after the 25th of August, they may be budded, the buds placed in the stem (not in the young shoots), about four inches from the ground, the buds will grow rapidly the following summer, and care must be taken about the middle of June to cut off the stock above the bud, an operation called by nurserymen, "heeling," or "snagging" the wound will then soon heal over, and the junction will be perfect. For standards, cuttings one year

FIG. 101.—BERMONDSEY FLOWER SHOW: AN EXHIBIT ARRANGED BY THE PARKS DEPARTMENT.

ornamented with flowers and ornamental shrubs; the cemeteries are to receive particular attention, and local inhabitants are to be invited to assist in keeping them planted and tended; and all town dwellers are to be encouraged to keep their window boxes and balconies gay with flowers. There is to be a great deal of propaganda with a view to creating and maintaining the necessary enthusiasm for the idea of a Belgique Fleurie, especially in the schools and in the press, and it is to be hoped that if—as is scarcely to be doubted—the sustained efforts of two years result in a greatly enhanced love of floral decoration among the Belgians, it will not be allowed to die down after the immediate object of it, namely the centenary festival, has passed.

Appointments for the Ensuing Week.

TUESDAY, SEPTEMBER 20: Post Office Savings Bank Horticultural Society's show. THURSDAY, SEPTEMBER 22: Ipswich Gardeners' Association's meeting. FRIDAY, SEPTEMBER 23: Staffordshire and Midland Counties Horticultural Society's show at Burton-on-Trent (two days). SATURDAY, SEPTEMBER 24: Leigh-on-Sea Horticultural Society's show.

old should be planted in rich soil, in rows three feet apart, and one foot plant from plant, suffered to grow one season, and then cut down close to the surface of the ground in February; several shoots will rise—leave three (if only one shoot is left, it becomes too full of sap, and breaks into numerous laterals); fasten one to a stake, and suffer the others to grow all the summer; early in the autumn remove the two wild shoots, the following summer the staked shoot will put forth many laterals. Cut off all those close to the stem within eighteen inches of the base, and allow the others to grow all the summer; bud in the stem at the height required, in August. *Thomas Rivers, Gard. Chron., September 18, 1852.*

The Week's Work.

THE ORCHID HOUSES.

By J. T. BARKER, Dunstable, Bedfordshire.

Cool-house Orchids.—The various members of the cool Orchid house include both species and hybrids of the genus *Odontoglossum*, and the hybrid families *Odontioda*, *Oncidioida* and *Wilsonara*. These Orchids include many charming plants of graceful appearance which are valuable when in bloom for affording a bright display in spring and early summer. They are also adapted for supplying cut blooms, as their graceful inflorescences lend themselves to all forms of decoration. Late summer and early autumn are generally regarded as the best seasons for attending to the roots of these plants, the longer and cooler nights and moist atmospheric conditions prevailing at those seasons affording conditions favourable to their re-establishment. Wherever it is possible, the best time to repot Orchids is after that period of inactivity which follows flowering, when the plants again start into growth, and the new growths commence to push forth new roots from their bases. If these roots can be anticipated, so much the better, as there is then no danger of any being broken during the operation of re-potting. When the compost is in good condition the plants may be shifted, if they have previously occupied small pots, without disturbing the roots much, merely picking out the sides and disentangling the roots, for it is bad practice to place any plant in a larger pot in a solid mass. Larger specimens growing in sour compost should have the old material carefully removed, and be repotted in the same sized pots, or even smaller ones, according to the roots.

Compost.—The potting material best suited to these plants is a compost of a soft nature, similar to that used for *Miltonias*. It is essential that the pots be well-drained to ensure a free passage of water, and in no case should the plants be overpotted. It is also advisable to remove all rootless, leafless, back, pseudo-bulbs. Plants that can be transferred to larger pots without involving much disturbance, should be placed by themselves, as they need special care in watering, for not having disturbed the roots much they will naturally need more moisture than those that have had the old compost removed. Watering the latter should be done with great care, for only sufficient moisture is needed to keep the compost moist, as roots extend more quickly in a partially dry compost than in one which is very wet. The plants will require to be shaded in bright weather, and weak and badly-rooted plants should be placed in the shadiest part of the house, while those with plenty of roots can be arranged with those that do not need repotting. The small-growing *Odontoglossum Cervantesii*, *O. Rossii*, *O. Oerstedii*, and others which received attention sometime since, are best grown suspended from the roof-rafters, while the larger-growing members of the family are best arranged on the stages. The dull, sunless weather of this summer has been to the advantage of these cool, moisture-loving plants. Proper atmospheric conditions are of primary importance, therefore judicious damping of the bare surfaces in the house and constant attention to ventilation are important details of cultivation.

THE KITCHEN GARDEN.

By R. H. CROCKFORD, Gardener to THE RT. HON. LORD WAVERTREE, Horsley Hall, Gresford, N. Wales.

Turnips.—There is yet time to make another small sowing of Turnips. The plants will form only small roots but will withstand the winter well.

Spinach.—There is still time to make a last sowing of this useful vegetable, especially of the prickly-leaved or Winter Spinach.

Cucumbers.—Where Cucumbers are cropping in cold frames every advantage should be taken of solar warmth, by closing the lights as early in the afternoons as possible, and covering them with mats at nights. Do not damp the foliage on cold days, and only very lightly on warm ones. The roots will not require much water now that the days are growing shorter. Keep the growths well-thinned and stopped regularly. When watering, a little stimulant should be used, either in the form of liquid manure or some quick-acting artificial sprinkled on the soil and watered in. Cucumbers growing in heated houses for winter cropping should have their growths trained thinly and kept as sturdily as possible or trouble will arise when cold weather sets in. Do not overcrop the plants or growth will soon become weak and the plants cease to bear. Keep the atmosphere humid, and maintain a night temperature of about 65°. Light top-dressings of rich loam mixed with bone-meal and a small quantity of leaf-mould or manure from an old Mushroom-bed, may be given with good results. Feed the roots with liquid cow manure at alternate waterings supplemented by a good fruit manure, or one especially prepared for Cucumbers. Keep a sharp watch for white fly, and so soon as the pest is detected, vaporise the house with a reliable fumigant. Thrips and red spider should also be watched for and destroyed.

Hoing.—The ground between growing crops should be stirred as frequently as possible with the Dutch hoe, especially between late-sown crops, as the heavy rains of late August have caused the soil to settle hard, in some instances almost like cement.

PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NALL-CAIN, Brocket Hall, Hertfordshire.

Perpetual Carnations.—Where these plants are growing in pits or frames they should be brought into their winter quarters at once, but, before doing this, the house in which they are to be grown should be thoroughly cleansed. The shingle on the plant stages should be washed also, and the walls lime-washed. The importance of cleanliness cannot be stressed too much, especially where Carnations have been grown in the same house during the past year. The receptacles in which the plants are growing should be washed, and the sticks or canes previously used for supporting Carnations soaked in a strong insecticide before using them again. Where a light, permanent shade has been applied on the glass for the summer occupants of the house this should be removed. After housing the plants, admit an abundance of air for the first few weeks, and if the plants are well supplied with flower buds, weak stimulants should be given the roots on frequent occasions. Where red spider is in evidence the plants should be syringed with two ounces of common salt in one gallon of water, taking care to wet the underside of the foliage with it.

Richardia africana.—Arum Lilies growing in the open in good soil should be lifted and either planted out in borders in a house specially suited to them or placed in pots. Where the spathes are in demand for use as cut flowers, the plants may be grown in borders or large pots. The *Richardia* is a gross feeder and requires a rich compost. A fairly retentive loam mixed with well-decayed cow manure is suitable. Where this plant is used for decorative purposes in pots they may be grown in receptacles six inches or seven inches in diameter, but when such small pots are used the plants will require liberal supplies of diluted liquid manure when in full growth. Others that are to be grown in borders should have the compost made fairly firm about their roots at the time of planting them. Extra care is necessary in watering until the plants are growing freely, when they may be watered freely.

The Stove House.—With the approach of autumn it will be wise to give the occupants of this house some attention. Cleanse the house

and also the plants. Climbers should be detached from their supports, cleansed thoroughly and the growths thinned, if necessary. *Caladiums*, *Gloxinias*, etc., are past their best and may be removed from the stove and gradually dried off. *Crotons*, *Dracaenas*, and any other plants that need more pot room, should be attended to forthwith, so that they may become established in the new soil before the advent of winter. Young stock of edging plants, such as *Panicum variegatum*, should be propagated to take the place of old plants that have done service through the summer. Exposure to sunshine is necessary to obtain rich colours in *Codiaeums*, and, unless the weather is exceptionally bright, shading may be discontinued.

HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD, Wrotham Park, Barnet, Middlesex.

Wall Fruits.—In gathering Peaches, Nectarines and other fruits of a soft texture the utmost care should be taken not to bruise them, as the least injury in this respect quickly sets up decay. The fruits should be gathered a little under ripe, when perfectly dry, and placed in boxes, resting each fruit on some soft material. They should be placed in a well-ventilated fruit-room until they are perfectly ripe. If Peaches are required for bottling, examine the trees at intervals and gather fruits of a medium size, handling them as little as possible, for the least bruise will discolour the flesh and spoil their appearance when bottled. So soon as the trees are cleared of their crops, cleanse the foliage. If red spider has been troublesome wash all parts of the trees with an insecticide. Remove all sub-laterals and, if the crop has been a heavy one, examine the roots to ascertain if they are dry. If moisture is necessary, soak them thoroughly with clear water, or, better still, with liquid manure. When planting young trees do not overlook the merits of Peach Peregrine, a most useful, highly coloured variety of good quality. Other varieties to be recommended are Hale's Early, Rivers' Early York, Dymond, Stirling Castle, Bellegarde, Violette Hâtive, Barrington and Nectarine Peach. The following are good sorts of Nectarines: Cardinal, Early Rivers, Elruge, Dryden, Spencer, Pine Apple, Humboldt and Violette Hâtive.

Late Plums.—See that the fruits of late varieties of Plums are well protected against attacks by birds. Blackbirds are amongst the first to peck the ripest fruits, and, if not prevented, quickly destroy the best specimens. Wasps also are usually very troublesome, and their nests should be hunted for and the wasps destroyed, either by pouring tar in the entrance of the nest at night time, or by cyanide of potassium. About an hour after a little of the cyanide has been poured into the entrance of the nest, the latter may be dug out and the grubs destroyed. This year Coe's Golden Drop, Jefferson's, Oullins Golden Gage, Washington, Victoria, Early Prolific and Denniston's Superb have cropped best in these gardens. Farleigh Prolific, Bradley's King and Merryweather Damsons have yielded well. The fruits of the last are very large in size, black, oval and of exquisite flavour; it is probably the largest and the best flavoured Damson in cultivation.

FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P., Ford Manor, Lingfield, Surrey.

Early Figs.—Trees that are intended to be started into growth in November or December must not be allowed to grow too strongly or the early crop next year will be unsatisfactory. Trees with their roots in confined spaces are not difficult to deal with, but a brick wall will not always prevent the roots from growing under and getting out of control. I prefer to grow the roots in a small space enclosed by turf walls which can be forked down and rebuilt annually. Three or four feet square of compost resting on a foot of drainage will support a very large Fig tree for a great number of years, and when the

old fermenting material and soil is removed it soon becomes dry and the wood ripens quickly. Rather light, calcareous loam mixed with old lime rubble, broken bricks, burnt clay and charcoal suits the Fig and such soil will take unlimited supplies of water. It is not necessary to disturb the whole of the ball of the tree, but the retaining wall of turf and a little soil should be removed annually in September, and the soil made up afresh. Unless the compost is very dry, little water will be necessary now, but care must be taken that every part is properly moistened before starting the trees into growth, and fermenting materials should be applied in November.

Cucumbers.—If any old plants now in full bearing show signs of deteriorating, they should be cut over by degrees and encouraged to develop fresh growths. The secret in restoring old Cucumber plants lies in a great measure not only in clearing off nearly all the fruits and faulty leaves, but also in stimulating the roots by the addition of fresh, rough compost, and the renovation of the fermenting materials that provide bottom heat. A compost of light, rich turf, free from worms, well mixed with old lime rubble, bone-meal and a dash of soot, should be prepared and placed in a warm, dry corner for future use as wanted. The compost will improve by keeping, and it should be used as a top-dressing, a little and often. No hard and fast rule can be laid down for watering, for some may be grown over hot-air chambers, whilst others derive a great deal of moisture from the hot-bed. Sufficient tepid water should be given to penetrate to the lowest roots, and keep them in a moderately moist condition. Autumn and winter plants growing in pots plunged in moist fermenting materials also derive a great deal of nourishment from the bed, but the root-run being limited, weak liquid manure, guano in solution, and soot-water should be used freely. Direct syringing will soon be unnecessary, but plenty of atmospheric moisture should be promoted and a brisk bottom heat of 80° maintained. If young plants are to be planted where late Melons are growing, hasten the development of the latter. The winter crop of Cucumbers should not be grown near the hot-water-pipes, or planted too closely together. Make the ball of soil and roots thoroughly moist before the plants are turned out of their pots, and when planting them pack warm soil about the roots and give the latter a little warm water.

THE FLOWER GARDEN.

By JOHN COVITS, Assistant Curator, Royal Botanic Gardens, Kew.

Ranunculus.—The various species of *Ranunculus* were at one time very popular in gardens, but they are seldom grown now, which is somewhat surprising, considering the beautiful display they make in beds and borders; they are also ideal for furnishing a supply of cut flowers, the French varieties being especially good for this purpose. On warm, well-drained soils, *Ranunculus* may be planted next month, but on cold, wet soils it is wise to defer planting until February. These bulbous plants should be grown in rich, well-manured soil, and it is an advantage to prepare the sites for planting some time in advance, and to incorporate plenty of well-decayed manure in the ground. Where necessary, the beds or borders should be raised somewhat above the general level. The dry, claw-like roots should be planted six inches apart and about three to four inches deep. For a supply of cut flowers they are best planted in the nursery or reserve garden.

Buddleia variabilis.—There are several fine varieties of this flowering shrub which flowers at a time when most shrubby plants are over; it is equally effective as a single specimen or grown in large groups in shrubberies. The best results are obtained when the plant is pruned hard back during the spring; it then makes strong shoots that terminate in great sprays of flower. This method of pruning is most effective for a number of other shrubs flowering at this time, viz., *Hydrangea paniculata* var. *grandiflora*, *Tamarix petandra* and *Ceanothus Gloire de Versailles*. The *Buddleia*

may be readily propagated at any time during the summer by means of twiggy, half-ripened, side-shoots, which root readily under a hand light either out-of-doors or in a cool house. The *Tamarix* is best propagated towards the end of October, when cuttings of the current year's shoots may be lined out in a sheltered border in the same manner as Gooseberry cuttings.

FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF AILSA, Culzean Castle, Maybole, Ayrshire.

Violets.—If Violets are required in the coming winter the plants should now be transferred to frames having a southern aspect. The soil should consist of a mixture of old loam, leaf-

Climbing Plants.—Some of the earlier-flowering climbers, such as *Wistaria* and *Clematis montana*, which have filled their allotted space, may have their long, straggling shoots shortened to a few buds. This refers particularly to *Wistarias* which throw out these annual growths in profusion, and flower very satisfactorily on spurs. Where there is still room for the extension of the plants the leading shoots should be nailed or tied in position and only the points of these shoots removed. *Clematis montana* and its variety *rubens* should only have their excessive growths thinned carefully, where they are inclined to become entangled, leaving a sufficiency of their trailing growths, which next season should be studded with flowers. Climbing Roses should have the old wood removed and the young shoots, which

FIG. 102.—ROSE POLLY.

See Awards by the National Rose Society, p. 236).

mould and well-rotted manure. Place the compost in the frames to within twelve inches of the light for the taller varieties such as *Princess of Wales*, and still nearer to the sashes for the *Neapolitan* and dwarfier kinds. Previous to lifting the plants, if the weather is dry, soak the roots with water and run a spade around each plant a day or two before lifting actually begins, when it will be found that the plants will experience very little check, and when well watered in their new quarters soon recover and grow freely again. Do not crowd the plants in the frames; a minimum distance of twelve inches should be allowed between the stronger-growing varieties, while the dwarfier kinds may be put from six inches to eight inches apart each way. Shade the frame during hot sunshine for a few days, and spray the plants frequently, in preference to heavy waterings, if they show signs of distress. Admit plenty of air night and day while the outside temperature remains warm.

are to provide next year's crop of flowers, tied to their supports, removing all weakly and unnecessary shoots in the process, so that the remaining ones may have every opportunity of becoming ripened during the autumn. The *Wichuraiana* hybrid Roses are easily propagated from cuttings, and these should be selected as the above work proceeds, labelled and inserted in nursery rows, placing an inch or so of sand for the base of the cuttings to rest on. This season the following varieties have been outstandingly good: *American Pillar*, *Excelsa*, *Una*, *Shalimar*, *Blush Rambler*, *Dorothy Perkins* and its white-flowered sport, *White Dorothy*.

Hoeing.—As the season advances, in some gardens the Dutch hoe is laid aside or forgotten, but it is still necessary to use this useful implement to aerate the soil between rows of recently-sown or planted crops. Weeds are still very numerous, and the frequent moving of the soil will keep these in check.

FLORISTS' FLOWERS.

A BORDER OF CARNATIONS.

I VENTURE to publish what may prove to be an unbeatable record of the floriferousness of a variety of the border Carnation! The border is in Councillor Crick's garden, Church Street, Ampthill. The variety is Feltham Scarlet, one of the hardiest, freest-flowering of border Carnations ever sent out, and the number of spikes are, approximately, 2,700. The border is eighteen yards long, and I arrived at my figures by marking off and counting a few yard-lengths separately. In practically every instance there were 150 spikes to the yard. The Carnations were three years' or four years' old and numbered fifty-four to fifty-eight. The plants are planted so as to overhang a brick wall two feet high by nine inches wide, the aspect being west. A sprinkling of soot is the only aid these plants have had. I believe the gardening world owes the introduction of this grand Carnation to the foresight of the Messrs. Thomas Ware of the Feltham Nurseries, Middlesex. C. Turner.

EXHIBITION CHRYSANTHEMUMS.

SWELLING flower buds that are to perfect the huge show blossoms indicate the approach of Chrysanthemum shows and that growers will very soon reap the reward of months of careful cultivation. Eight weeks from bud to opening flower seems a long period, yet highly developed specimens take this time.

The orthodox number of blooms to a plant of the Japanese varieties was for some time three; bold spirits reduced this to a pair, and still bolder attempted but one. To-day concentration can go no further, and an advance in size of flower is a remote possibility. Take at random a dozen sorts that include Ajax, Louisa Pockett, Majestic, Mrs. G. Drabble, Mrs. Harold Wells, Mrs. R. C. Pulling, Mr. Thos. W. Pockett, Norman Chittenden, Queen Mary and William Turner; many of these have had a long period of popularity and are still in the front rank. Some of them, indeed, have given a similarity of type with a change in colour.

The close, ball-shaped, incurved sorts occupy a small place in the background and are not likely to be revived unless there arises some young cultivator who will give the patience required to combine cultivation with "dressing." It seems strange that this art of "dressing" is almost dead, especially as there are better varieties available now than formerly.

A producer of plants for sale can gauge the general interest in the different styles of Chrysanthemums as well as most folk, and from this standpoint the demand for single-flowered ones, although fair, does not as yet prove a great advance; for exhibition uses these have, indeed, a long way to go before they will oust the Japanese varieties from the show board. Pretty as they are, the singles fail to produce that spirit—the desire to excel in their culture—as do the double forms. In regard to the former, however, recently-raised varieties are so beautiful and such an improvement in size, as well as in colouring and substance, that there is no knowing what impetus they will provide when in the hands of growers generally.

Giant plants of Chrysanthemums are not popular for show purposes, but the medium-sized varieties could, I think, easily be grown for competitive purposes.

Knowledge is limited in regard to the marvelous productions of the more skilful growers for market; these growers turn out perfect flowers and they are fastidious as to stem and leaf, poise of bloom on the stem and, indeed, all that pertains to the useful and ornamental in Chrysanthemums. Were this style exploited as it should be the something fresh which is always needed in regard to exhibiting would be likely to be forthcoming and add interest in future arrangements.

Trade growers are in the habit of using the type of flower referred to, and from the point of view of the public this may be quite as pleasing as "big" blooms. The old form of showing groups of pot plants is not on the increase;

such groups are too formal for modern tastes. It is a surprise to the writer that so little is done in the way of exhibiting for competition cut blooms of the most generally popular class of all: I mean varieties that are grown in the open ground. Before the great upset in 1914, there were occasions when early-flowering Chrysanthemums were prominent at shows, and now, at a period when varieties are infinitely superior to the old ones, there seems a difficulty in getting growers to cultivate them seriously for the purpose. To manage these "just for cutting" is useful in a way, but numbers of gardeners have no conception of the capabilities of these garden kinds as grown for exhibition. Trade growers lead again, in this instance, as they do in what are known as double decorative varieties.

Exhibition Chrysanthemums have, for upwards of fifty years, held the attention of gardeners as few other flowers have, and the desire to excel need not begin and end with the giant flowers, considering the wealth of variety now available. There is room for the huge examples, of course, but still more for those that are more generally useful.

What of the prospects of the present year? For some weeks the roots of the plants were in a semi-saturated state owing to incessant rains. This is all very well from the point of view of labour saving, but is not conducive to good results. As I write, however, a change has come about and sunshine is playing a rapid part in ripening the growths, and, should this fine weather continue for a reasonable time, cultivators of the plants should be able to record a season favourable, on the whole, to excellent results. H. S.

ALPINE GARDEN.

VERONICA PECTINATA ROSEA.

THERE is such a wealth of Veronicas in the various sections, both shrubby and herbaceous, that it is most difficult to make a selection, and, even among the herbaceous species and varieties suitable for the rock garden, the selection is exceedingly troublesome. A trailing species of merit is *V. pectinata*, which is said to be plentiful over a wide area in Asia Minor. The typical plant has pale blue flowers, but the type is seldom seen in British gardens, and the species is usually represented by the rose-coloured variety, *V. p. rosea*. I have hunted through several catalogues of our largest dealers in such plants and have failed to find more than one offer of the typical form, but the rose one is fairly plentiful in commerce. This *Veronica* is of moderate growth and excellent for hanging over rock work or banks. It has hoary, velvet-like leaves, which form dense mats, and the stems bear a number of pleasing rose flowers. The plant grows wild in shady places, but does not object to sun in our climate. It may be grown in loam, sand and leaf-soil or peat. Propagation is best effected by cuttings, or careful division of the rooted portions. I am not aware of seeds of this plant being offered for sale.

DIANTHUS SEQUIERI.

THIS *Dianthus* blooms after practically all the other Pinks have finished their flowering season. It blooms even well into autumn—a time when flowers become scarce and consequently more precious in the rock garden. It may be grown and flowered well even on shady banks in the rock garden. Its cultivation is simple; it will grow in any fairly light garden loam, although the addition of a little leaf-soil and sand is an advantage. *D. Seguieri* is a plant of moderate stature, as it grows only about nine inches high. It has long, rather grassy leaves, and a few of these appear also on the stems, which bear generally one, but sometimes two or three flowers each. The blooms are of a brilliant magenta colour with a purple eye which appears to tone down the other colouring.

This *Dianthus* is quite hardy and perennial, and may be increased by cuttings or raised from seeds sown in shallow drills in the open in May or June, or under glass earlier,

SAXIFRAGA COTYLEDON CATERHAMENSIS.

SAXIFRAGA Cotyledon, in all its forms, is a most welcome plant in any garden, and at one time it was frequently to be found in the windows of many a rural cottage, where its rosettes of leaves and noble plumes of flowers gave a feature to the home.

The variety *caterhamensis* has long, shapely rosettes and noble, arching plumes of white flowers, handsomely freckled with spots of crimson. It is uncertain where the variety originated, but it came into commerce after being seen in a Caterham garden. It is, I consider, even superior to that magnificent form of *S. Cotyledon* called *islandica*. *S. C. caterhamensis* is in commerce, and should be secured by all lovers of the taller silver Saxifrages. S. Arnott.

CAMPANULA VIDALII.

This uncommon *Campanula*, native of the Azores, is an excellent rock plant for mild localities, for the alpine or cool house in colder areas.

A warm, sheltered spot is necessary with medium-textured soil containing a good supply of humus. Given these conditions, it will form a stout, woody stem, bearing at the top numerous spoon-shaped leaves.

In August these produce twelve-inch racemes of heavy, white flowers, looking like numerous Japanese lanterns, having a distinct waist-line. An established plant will produce up to twenty stems, each bearing about fifteen flowers open together. L. Le C. J.

CYTISUS KEWENSIS.

THIS beautiful hybrid Broom is of prostrate habit and ideal for planting in the rock garden, where it will hang over the face of a rock, like a miniature cascade; it is also suitable for growing on a sloping bank.

During April and May the slender, pliant branches are densely clothed with cream-coloured flowers which remain in good condition for a considerable time.

Cytisus kewensis is quite hardy and presents no difficulties in cultivation, for it succeeds well in most garden soils but prefers a rather light, sandy medium.

This hybrid Broom was raised at Kew, the parents being *C. Ardoinii* and *C. albus*. T. H. Everett.

SILENE SCHAFTA.

THIS dwarf *Silene* flowers at this season of the year when most alpine are over, and is most effective when massed. It should be planted in a warm, sunny position in moderately light, loamy soil. Under these conditions it will form carpets of branched, leafy growths up to about six inches in height, which in late summer are absolutely covered with large, bright, purplish-rose flowers. It is a free grower and one of the easiest of rock plants to cultivate.

Seeds offer by far the best method of increase, as spring-raised plants will flower well in the same year; cuttings may be rooted in sand under a bell-glass or in a cold frame, if seeds are not available.

LIPPIA NODIFLORA.

PLANTS which produce their flowers late in the season are always of value in the rock garden, especially if they are of dwarf stature. *Lippia nodiflora* is a dwarf, creeping perennial from the warmer parts of North America. It forms dense mats of oppositely-branched growths which produce roots at almost every node, and are clothed with cuneate or spatulate, light green leaves, half-an-inch or so in length, with the margins toothed on the upper half.

The small flowers, opening rose-purple and fading to white, are produced during August and September in dense heads on slender, erect stems, two inches to six inches long, and arising from the nodes along the main growths. The plant is a rapid grower and free bloomer, and should be grown in light, sandy soil in a sunny position. Unfortunately, it is not quite hardy and often perishes during the winter, so that it is advisable to establish some of the rooted shoots in pots during late summer and to winter them in a cold frame. A. G. F.

FLOWER GARDEN.

PHYGELIUS CAPENSIS.

Two years ago, a friend gave me a few half-ripened cuttings of *Phygelius capensis* which I managed to root successfully in a cold frame in July, and they have just rewarded me with a most delightful show of blossom.

This plant is also known as the Cape Figwort; it is a native of South Africa, and belongs to the Order Scrophulariaceae. There are only two recorded species of this genus, and *P. capensis* appears to be the only one which has been introduced. The plant is not perfectly hardy in exposed districts, but here, in Hertfordshire, it has survived so many as 21° of frost without protection last winter. The derivation of its name would appear to indicate that it is a shade-loving plant, but I have found that it succeeds and flowers well in light, rich soil where it receives full sun from mid-day onwards.

It is erect in growth, and makes a neat shrub, three feet high; the leaves are glabrous, two to three inches long, ovate-lanceolate in shape. The flowers are very conspicuous in colour, form, and the manner in which they are borne. They are disposed in terminal panicles, each peduncle carrying three to seven flowers on slightly recurved pedicels. The corolla is one-and-a-half inch long, tubular, and inclined to be incurved or slightly erect and constricted above the ovary. The flowers are orange-scarlet outside with a touch of crimson around the five-toothed margin, and golden-yellow inside. The filaments are crimson, flattened, and slightly longer than the corolla, the thin tubular style being half as long again.

The plants set an abundance of seeds which may be easily germinated in moderate heat in spring. R. K.

NEPETA MUSSINII.

THIS Sage deserves to be regarded as one of the best plants in the garden. It grows well in almost any soil and situation and furnishes a continuous supply of flowers over a very long period. The inflorescences are useful as cut flowers, while even the foliage of the plant is attractive. This *Nepeta* may be used as an edging for a border, for planting in the rockery, on a dry wall, or for massing in the hardy border. Old plants may be divided in autumn or spring, and even so late as the flowering time, though this is not advised. As your correspondent, on p. 27, states, cuttings may be rooted now. My object, however, in penning this note is to draw the attention of readers to the fact that it is possible to root cuttings in the spring to provide plants for flowering in the summer. I have done this for two successive years. Last year I had occasion to plant some beds of Roses, each large bed accommodating about 150 plants at two feet apart, and I wanted something to give colour to the bed, apart from the Roses, which were not expected to make a great show the first year. As I required about 1,000 plants to set between the Roses and to provide an edging to the bed, I was somewhat puzzled to know what to use, and eventually decided on Catmint, provided that I was able to root it in the spring. A few cuttings as an experiment soon decided the matter, and I inserted them in pure sand in a propagator in a vinery. The cuttings were merely snipped off with a small pair of scissors above and not below a joint, so that they were internodal cuttings. No further preparation was given and they were inserted in the wet sand on March 6. In due course they were boxed up and planted in the beds on April 30. They all grew well, so much so that during July they had made so much growth that I was obliged to clip them back to prevent them from smothering the Roses. The latter were planted two feet apart, and a plant of *Nepeta* was set out in the centre of the square formed by four Roses.

This year, also, I had occasion to need some Catmint for an edging, and rooted cuttings towards the end of March. Later, on April 11, I put in some more and was able to get these boxed from the propagator a week later and to plant them out on May 10. Now they have formed a dense line and are flowering nicely, but will improve.

Few, indeed, are the plants which can be grown from the cutting to the flowering stage in less than three months, and when planted at more than a foot apart to meet in that time.

I have used *Nepeta Mussinii* in connection with *Antirrhinums* and Sweet Peas, also with Sweet Peas and the beautiful Sweet William, Pink Beauty. In the border the blue of the Catmint harmonises well with the yellow of *Calendulas* Orange King and Lemon Queen, and I cherish a hope some day of associating it with columns of such Ivy-leaved *Pelargoniums* as *Madame Crousse* and *Charles Turner*. *William F. Rowles*, *Wroxham Hall Gardens*, *Norwich*.

VERBENAS.

TIME was when Verbenas were cultivated largely for exhibition purposes, but this was so long ago as when Henry Eckford, Richard Dean

they are worthy of a place in the flower garden, as indicated in Fig. 103 which represents a group in one of the borders at Waterlow Park in North London.

It is hardly necessary to state Verbenas are easily raised from seeds, and that the propagation of selected varieties by cuttings affords no real difficulty. K.

HARDY FLOWER BORDER.

HELENIUMS.

THESE well-known summer and autumn flowering herbaceous perennials add much to the brightness of the borders at this season when their masses of rich yellow-orange, crimson-

FIG. 103.—VERBENAS IN A FLOWER BORDER.

and other florists were powers in the land. At that time, and even later, Verbenas were also grown for summer bedding effects and plants were pegged down with great regularity. The results under good cultivation and after much patience were excellent, but at the present time few people would give the time necessary to produce such results.

However, modern strains of Verbenas have been so improved in so far as vigour and freedom of flowering are concerned—as witness the variety *Miss Willmott*, which is grown extensively as a pot plant for Covent Garden Market—that pegging down is neither necessary nor desirable. In the flower garden modern strains of Verbenas grow freely and are allowed their freedom, although a few short, twiggy branches are often placed among them to afford the little support they need. Under these conditions

striped and blotched flowers make an attractive display. The introduction of new and improved varieties in recent times has added considerably to the usefulness of the genus, and the autumn-flowering section is particularly valuable.

All *Heleniums* are of easy culture and thrive in various types of soils, although they do not make strong growth on light, sandy soils, unless these are heavily manured when preparing the borders for planting. It is necessary to divide the clumps frequently or they become crowded, lose vitality, and give only small, thin growths and flowers of inferior quality. As the stems and foliage are rather heavy, some kind of support will be necessary for the taller-growing varieties, therefore staking should not be neglected.

The dwarfier kinds are usually the earliest to flower, and amongst these *H. pumilum* is

popular because of its dwarf habit and rich yellow flowers, which make it a good plant for permanent beds. *H. p. grandiflorum* is a fine and vigorous form with larger flowers, but it is considerably taller in growth. *H. Bigelovii* is also a very effective, compact-growing species, producing its rich golden flowers with great freedom. *Crimson Beauty* is one of the best of the dwarf varieties and an exceedingly fine plant with deep, brownish-crimson flowers. It is also of very sturdy growth and rigid habit, and stands up well without supports.

Of the taller-growing kinds, *H. autumnale* and its variety *grandiflorum* are well worth growing, their large, yellow flowers being very showy and excellent for cutting. *H. a. rubrum* is a highly attractive plant, with large, deep, mahogany-crimson flowers which give it a rich, warm tone. *H. striatum* is a showy and distinct autumn-flowering species, bearing massive, branched heads of deep orange flowers, striped with crimson. *Riverton Gem* is also a fine variety and a robust grower, the flowers being rich terra-cotta suffused with old gold. *A. P. C.*

A FEW USEFUL SALVIAS.

The genus *Salvia* is a very large one, embracing stove, greenhouse, hardy perennial and annual species. Some of the greenhouse species of a shrubby nature are useful for growing against low terrace walls in the milder parts of this country. Few of the South American species are really hardy in the open with us, but many of them are worth growing for the decoration of the conservatory or greenhouse during autumn and early winter. The hardy herbaceous species are valuable plants where room can be found for fairly large groups, for they provide a bright display over a long period and will grow well in any good garden soil, provided it is well-drained.

Probably the most common Sage planted in herbaceous borders is *S. virgata nemorosa*. This is a very free-flowering plant and continues to bloom over a long period. It grows from two feet to three feet high and produces flowers of a reddish-violet colour. Where large numbers of bedding plants are required annually this is a valuable plant, being easy of propagation, either from cuttings or division, according to the stocks available and the number required. Where this *Salvia* is planted in large masses, a fine effect is produced by using the silvery-grey-leaved *Cineraria maritima* as a dot plant amongst it.

S. argentea has large, silvery leaves and tall, branching spikes of white flowers. It is a striking plant and should be included in all collections of hardy plants. It is worthy of a prominent place near the front of the border where the large, silvery leaves, which are often from twelve inches to eighteen inches long, may be seen to advantage.

S. turkestanica produces tall spikes covered with pink-coloured bracts, and is a useful subject for the larger borders. In good soil this species attains a height of seven feet to eight feet, and is effective for a considerable period; it is also useful for grouping in large shrub borders where room is available.

The native *S. pratensis* has bright blue flowers, but many forms of this plant are to be met with, some with flesh-coloured flowers others rosy-pink and some white.

S. dichroa from the Atlas Mountains is a splendid plant for the milder districts, growing from six feet to eight feet high, with racemes of flowers two feet to three feet long. The colour of the upper part of the bloom is bright blue, the lower lip pale blue, the middle lobe white. This species has the habit of commencing to grow during late autumn and the young leaves are liable to be cut by frosts, but as the plant is seldom damaged beyond recovery, it is worthy of extended trial.

S. officinalis, the Common Sage, is well-known, but the fine form, *S. o. purpurea*, is not common in gardens. This is a free-growing plant of a dwarf, shrubby nature with highly-

coloured foliage which makes an outstanding mass of colour in either the shrubbery or herbaceous border. It is especially effective when planted in association with or near by some clear yellow flowering plant or shrub.

S. azurea, a native of North America, has deep azure-blue flowers; the plant grows about four feet high and blooms during September and October. There is a white-flowered form of this species, but it is not so attractive as the type. *S. farinacea* is a beautiful plant from Texas bearing violet-blue flowers, while the flower spikes are lightly covered with a white powder which adds to the attractive appearance of the plant. On light, well-drained soils this Sage is hardy, but in case of doubt it is worthy of the protection of a cold frame or greenhouse during the winter.

Salvias that need the protection of a frost-proof house or pit during the winter include *S. Pittieri*, a valuable species from Costa Rica. It is easily propagated from cuttings which soon make good plants in favoured districts. *S. Pittieri* may withstand the winter in the open. The flower spikes are from eight inches to ten inches long, and the blooms of a rich blood-red, with a velvet-like texture; a plant in bloom is a blaze of colour in the autumn.

The well-known scarlet *S. fulgens* is another brilliantly coloured species from the Mexican mountains. It grows from two-and-a-half feet to three feet high. This Sage has wintered in the open border at Wisley, but, like the preceding, it is worth the trouble of taking cuttings during the autumn. *S. involucrata* var. *Bethellii* is a handsome plant of bold, upright habit, and makes an imposing group in the herbaceous border, with its bright rosy-crimson flowers, borne on whorled spikes; in the bud stage each whorl is surrounded by a large, coloured bract. This also is a Mexican plant and should be propagated each autumn from cuttings. *S. Greggii* is a greenhouse shrub of distinct habit with carmine-red flowers and in many places makes an ideal plant for training against low, sunny walls in the open. Good specimens of this Sage may be seen in some gardens in Sussex, where they must have been for many years; when the plants have made hard wood they will resist a considerable amount of frost, especially if a few Spruce branches are placed around them during hard weather.

Two of the most common Salvias used as bedding plants are *S. patens* and *S. splendens*; the beautiful blue of the former is equalled by few flowers in cultivation. It is especially good in districts mild enough to allow the tubers to remain in their flowering quarters, protected only by an annual top-dressing of old manure or leaf-mould. Grown thus and left undisturbed for three or four years the plant is seen at its best. There are many forms of *S. splendens*; one of the best varieties is *Harbinger*, which is of dwarf habit and flowers early, thus giving the plant a long season of bloom. *R. F., Wisley.*

MESEMBRYANTHEMUM.

(Continued from p. 92).

CONOPHYTUM.

Conophytum elegans, N. E. Br.—This name must replace that of *Lithops Marlothii*, N. E. Br. in *The Gardeners' Chronicle*, 1926, Vol. LXXIX, p. 102, f. 52, for having now flowered with Mr. T. Endean (who has very kindly sent his plant for me to see), it proves to be a *Conophytum*. When first sent to me, the flat top, its curious, window-like structure and the fissure right across it was so like that of *Lithops* that I fell into the error of placing it in that genus. The flower, however, is that of a *Conophytum*; it is 8-9 lines in diameter, pure white, with a ring of scale-like yellow stamens at the mouth of the 4-line long tube. The stamens are seated low down in the tube, but above the stigmas. The flower opens only in bright sunshine and is not scented. Another synonym of this plant is *Ophthalmophyllum Marlothii*, Schwantes in *Moller's Deutsch Gart. Zeit.*, 1927, p. 64. The specific name *Marlothii* cannot be retained for it, as that name has already been used for a *Conophytum*.

C. frutescens, Schwantes in *Moller's Deutsch Gart. Zeit.*, 1927, p. 123, is a synonym of *C. cauliferum*, N. E. Br. The differences mentioned by Schwantes to separate them are only non-specific individual features.

CLERETUM, N. E. Br.

This genus was published in *The Gardeners' Chronicle*, 1925, Vol. LXXVIII, p. 412, but has recently been redescribed under the synonymic name of *Dorotheanthus* by Schwantes in *Moller's Deutsch Gart. Zeit.*, 1927, p. 283. The species are: *C. apetalum*, N. E. Br. (*Mesembryanthemum apetalum*, L.); *C. criniflorum*, N. E. Br. (*M. criniflorum*, L. *Dorotheanthus criniflorus*, Schwant.)—this is the type of the genus *Cleretum*; *C. gramineum*, N. E. Br. (*M. gramineum*, Haw., *Dorotheanthus gramineus*, Schwant.); *C. papulosum*, N. E. Br., (*M. papulosum*, L.); *C. pinnatifidum*, N. E. Br. (*M. pinnatifidum*, L. f.); *C. puberulum*, N. E. Br. (*M. puberulum*, Haw.). N. E. Brown.

(To be continued).

A REVISION OF VIOLAS.

(Continued from page 128).

V. LYALLII, Hooker, belongs to a section of ten species inhabiting east and south-east Asia, south to Tasmania and New Zealand, and having small but generally brightly-coloured flowers. The only representative of the section in cultivation, so far as I am aware, is *V. arcuata*, Blume, and that under the name of *V. distans*, Wall. *V. Lyallii* is a dwarf, stemless, stoloniferous plant with longly petioled, nearly reniform leaves openly cordate at the base; it has white petals, of which the lowermost is striated with violet, and a very short spur.

V. macedonica, Boiss and Heldr., is one of the geographical forms of *V. alpestris*. This polymorphic species comprises *V. alpestris*, Jord., in the narrow sense, from the western Alps; *V. polychroma*, Kerner, from the Austrian Tyrol and Styria; *V. pseudo-lutea*, Schur., from Transylvania; *V. macedonica* and *V. aetolica*, Boiss and Heldr., from the Balkans. As a rule, *V. alpestris* is perennial, and has blossoms of yellow or violet, or these colours mixed. *V. polychroma* (which is in cultivation) is blue, while *V. macedonica* is either all yellow or has the two upper petals blue-violet and the rest yellow. It is very abundant among rocks in the vicinity of Belgrade. A distinguishing mark of the species in its wide sense is the large, leaf-like terminal segment of the stipules. I have had sent to me *V. aetolica* var. *heterosepala* under the name of *V. oetholica*; it is distinguished by the unequal size of the sepals.

V. magellanica, Forst., is linked by Farrer with four other species, of which *V. sericea* and *V. argentea* are false names (unless by the latter is intended *V. argentina*, an annual from the Andes), and *V. ovalifolia* belongs to a distinct section inhabiting the mountains of southern Asia from Afghanistan to Sumatra. *V. magellanica* and *V. Commersonii*, D.C., hail from Magellan's Straits, and belong to a small section, the main representative of which is *V. maculata*, Cav. The last-named is native of the Falkland Islands, Terra Del Fuego and the line of the Andes between Patagonia and Chile. Others of the section run north into central Chile. The general characteristics of all are the long root, the almost stemless shoots, the fringed stipules, longish to round crenate leaves, yellow or blue flowers and short spur.

V. majellensis, Porta and Rigo, should not be spelt *magellensis* as it has no connection with Magellan's Straits, but comes from Mount Majella in the Abruzzi in central Italy, where it grows on calcareous soil at about 8,000 to 9,000 feet. It is a dwarf plant, akin to *V. cenisia*, with the straggling root of that species, but with the leaves plicate and more crowded, the blade equal in length to the petiole and gradually running down into it, the stipules undivided or with one or two small lobes (as in *V. cenisia*), but with the lobes inserted in the middle or upper part of the main stipule instead of at the base, with large and nearly entire auricles, the spur considerably exceeding the auricles, and violet flowers large for the size of the plant.

V. minuta, M.B., has no affinity with *V. alpina* (if there is a "missing link" between *V. oenisia* and *V. alpina*, it is *V. odontocalycina*, Boiss.). The typical *V. minuta* from Mount Kasbek is pubescent, but there is a variety, var. *Meyeriana*, which is quite glabrous, from Mount Elbrus, both localities in the Caucasus. It is strictly a *Cenisia Viola*, with long, straggling roots which erupt into tufts of crowded leaves that are borne on long petioles and are nearly entire, and with the lobes of the stipules varying greatly in size. The plant does not exceed four inches in height, and the flowers are large, long-spurred, yellow (sometimes with a purplish tinge towards the edges of the petals), and stand well above the leaves.

V. mirabilis, L., cannot, in Farrer's opinion, "live up to its name," which might be an apt criticism were its name *V. miranda*. What is "surprising" (not necessarily "admirable") in this species is that it unites many varying characters, which are found elsewhere in separate species. Thus, in its earliest stages, it is a stemless plant, putting forth stemmed shoots later, or it may be stemmed from the outset. The stipules are quite entire, the lower ones brownish-red, the upper green. The stem, 20cm. to 40cm. high, bears only one leaf in its lower and middle part, but is densely leafy at the top. The earliest flowers that spring direct from the rootstock are longly, the stem flowers shortly, the uppermost very shortly, peduncled. All are petaliferous except the uppermost, which are only cleistogamous. The flowers are fragrant, rather large and densely bearded, the colour pale lilac, bright blue, reddish, or sometimes white. The leaves, reniform, openly cordate and longly petioled, are rolled together when young like a paper-screw, as in *V. cucullata*. It is not an alpine species, but frequents light woods at low altitudes, as near Geneva and the lower Pesio Valley in the Ligurians, in both of which localities it is common. Widespread in Europe, it does not reach the north of Scandinavia, does not come further west than eastern France, or go further south than northern Italy. Eastwards it extends to Siberia and Japan, but is not Arctic. It appears to be exclusively calicole. It is curious that Farrer slipped in giving the leaves as "finely divided," as he elsewhere pointed out that *V. pinnata* was the only one of our alpine Violets with divided foliage after the fashion of *V. pedata*.

V. missouriensis, Greene, is not confined to Missouri but extends from Illinois, further north, to Texas in the far south. It inhabits low-lying grounds which are often flooded, along creeks and in low woods.

V. montana, L., is now related to *V. canina* as a subspecies. These two forms appear to be mutually exclusive in certain unrelated areas, e.g., in Scandinavia, Bavaria and the Maritime Alps only the subspecies *montana* is found. In other districts, e.g., round the Lake of Geneva, they occur together and are so inextricably mixed as almost to be indeterminable. The extreme types of each would appear to be indicated as follows:—Stems of *V. montana* taller and more erect (in *V. canina* recumbent or ascending); leaves of *V. montana* paler, thinner, truncate at the base, with a longer but obtuse tip (in *V. canina* dark, thick, usually flatly cordate, the upper ones rather acuminate); stipules of *V. montana* ciliate, toothed, about half the petiole of the middle leaves, sometimes exceeding the petioles of the upper leaves (in *V. canina* often entire on the inner side, and much shorter than the petioles); petals of *V. montana* longer, narrower, sky-blue with whitish base, rarely almost white (in *V. canina* obovate, often rather deep blue with white base); the spur of *V. montana* at first green, then white, sometimes long (in *V. canina* yellowish or white, usually shorter); capsule of *V. montana* more pointed (in *V. canina* obtuse but apiculate). The subspecies ranges from Greenland and Iceland through Europe to the Caucasus, Turkestan, Siberia and Japan. It ascends to 6,500 feet in the Maritimes. In England it is represented in Huntingdon under the name of *V. nemoralis*, Ktz., and near Bournemouth in the variety *dunensis*.

V. multifida, Willd. (syn. *V. dissecta* Ledeb.), is now given as *V. pinnata* subsp. *multifida*.

The "Pinnatae" group, standing high in merit among Violets, comprises five species: *V. pinnata*, *V. incisa*, *V. Forrestiana*, *V. dactyloides*, and *V. chaerophylloides*. Their main characters are: absence of stem and stolons, short rootstock with a few rootlets springing almost from one point; stipules adnate to beyond their middle point; divided leaves, fragrant flowers, bearded lateral petals, and long spur. The sub-species *multifida* is generally taller than the type, and has the leaves more deeply divided, the leaf segments being either oblong, obtuse and digitately divided (var. *latisecta*), or narrowly linear and rather pinnately divided (var. *angustisecta*, the form common in China). It is native to Turkestan, Mongolia (the Altai), Siberia (rocks on the Baikal

BULB GARDEN.

LILIUM HUMBOLDTII VAR. MAGNIFICUM.

ALTHOUGH many gardeners attempt the cultivation, again and again, of plants that only occasionally reward their patient endeavours, there are others who prefer to cultivate those subjects that grow and flower with reasonable freedom and without needing special conditions and attention. *Lilium Humboldtii* is a "difficult" plant and has often disappointed the grower, therefore many gardeners will not consider the cultivation of a Lily under that name. To such, however, the varietal form

FIG. 104.—LILIUM HUMBOLDTII VAR. MAGNIFICUM.

Sea), the Amur region and the shores of the Arctic Ocean, and northern China. It grows on hills, steppes, dry places and rocks, and rises to nearly 10,000 feet. There is also a var. *lobata* found near Irkutsk and in Manchuria in which the leaf is cleft only one-third or one-half. The sub-species is in cultivation under the name *V. dissecta*.

V. Munbyana, Boiss. and Reut., with the kindred *V. Battandieri* was described in *The Gardeners' Chronicle*, July 10, 1926. It is native to northern Algeria and Tunis, rising to upwards of 4,000 feet in the mountains. It is a downy plant up to 30cm. tall, with yellow or violet flowers, one to three on each shoot. The violet form, but not the yellow, is well-known in gardens. Like the next species, it belongs to the group *Altaica*. E. Enever Todd, Lt.-Col.

(To be continued).

may be commended, for, although it is not so robust and hardy as many other garden Lilies, it is by no means so difficult to accommodate as is the type.

This varietal form is *Lilium Humboldtii* var. *magnificum* (Fig. 104), which may grow so high as six feet and carry many of its blooms—coloured orange, red and gold, and thickly spotted with purple—on elegant, reddish-brown stems that bear their leaves in whorls.

Soil containing a good supply of humus, a moderately sheltered position and good drainage appear to be conditions necessary to success, while some covering, such as old leaves, leaf-mould or Bracken—laid over a few short branches of Gorse or other tree or shrub so as to prevent the Bracken from lying close and heavy on the soil—will serve as some measure of protection from severe frost. K.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the **PUBLISHER, 5, Tavistock Street, Covent Garden, W.C. 2.**

Illustrations.—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Urgent Communications.—If sent by telegraph, these should be addressed "Gard. Chron.," Rand; or by telephone, to Gerrard, 1543.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Letters for Publication as well as specimens of plants for naming, should be addressed to the **EDITORS, 5, Tavistock Street, Covent Garden, London.** Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

NOTES FROM EDINBURGH.

TREES and shrubs have more or less taken on their autumn tints and remind us of the advancing flowerless period. Throughout August, seed-collecting was impossible and plants then in flower were robbed of their ability to set good seeds. Late-flowering plants, however, are responding to the renewed bright sunshine and will, if it continues, be able to reproduce themselves. Sunshine is now also welcomed for the beneficial effects of ripening wood and preparing plants for the winter, while ornamental trees and shrubs will benefit by having their foliage and berries coloured so that they may contribute to the beauty of lake-sides, shrubberies and the garden in general.

Many late-flowering plants are adding beauty and attraction to the rock garden. They are indeed welcome for their colour and brightness which help to remove the present dull appearance expected at this time. *Colchicum autumnale* and *C. Stevenii* are among the early-flowering species, and, although the flowers in this group are unaccompanied by foliage, this does not detract from their beauty.

The *Gentian* family is in the forefront for giving a good display. They are invaluable for their many shades of blue, white and purple. *G. Farreri* and *G. sino-ornata* are now so common they need no description to recommend them to lovers of the genus. *G. hexaphylla* is worth cultivating, and may be propagated very easily by division. In winter-time it resembles a *Saxifraga* of the *Burseriana* group by forming its young shoots into cushions of remarkable compact habit, which in spring elongate to produce flowering stems, each terminating in a lovely blue flower. *G. asclepiadea* and the variety *alba*, *G. Freyniana*, *G. lagodechiana*, *G. septemfida*, and even our own native *G. Pneumonanthe*, are all charming species now in flower.

The genus *Cyananthus* is remarkable for its lovely blue flowers. At present many fine specimens are in full bloom and very attractive. Among the half-dozen in cultivation, *C. lobatus*, *C. incanus* and the variety *leicalyx* are the best. Although somewhat late in the season, quite a dozen young plants of *Meconopsis grandis* have produced some remarkably large flowers, and from their robust appearance good seeds are expected later.

The *Primula* family is well represented by large, crowded groups of *P. capitata* and its many forms. When planted thickly these make a wonderful show at this season with their capitate heads of beautiful blue flowers and mealy stems. *Astilbe chinensis pumila*, a dwarf and compact member of the *Saxifragaceae* family, is to be recommended as useful. It produces stout, erect inflorescences of a pink and lilac colour. It likes a damp situation and lends itself to grouping for effect. In an open bay in partial shade a good form of *Delphinium grandiflorum* is flowering to perfection. The

free and floriferous nature of this plant and its dwarf habit make it a special favourite. It may be utilised with success for growing in beds or borders.

Calluna vulgaris and its many varieties of brilliant colour contribute their share of effect in autumn. Among them, *C. vulgaris incana* is attractive on account of its dull grey feathery foliage.

The Chinese *Roscoea cautleoides* is a warm favourite for autumn flowering. In a pocket facing south many good spikes are to be seen with pale yellow flowers. It is propagated easily by division or seeds and never fails to produce abundance of flowers when given a suitable aspect. The Himalayan species, *R. purpurea*, is also a very desirable plant with purple flowers and good habit. In the same family *Cautlea robusta* is of interest on account of its robust habit and golden-yellow flowers, which are gracefully borne among the dark-green, strap-shaped leaves.

A batch of *Calceolaria tenella*, a dwarf Chilean species six inches high, looks very pretty with its small, golden-yellow flowers and orange-red spots within the lower lip. Although few-flowered, its small leaves and spreading habit make it very attractive. In addition, numerous shrubs are contributing their share of colours throughout the garden.

Hypericum Hookerianum, *H. patulum* and the variety *Henryi* are gloriously in full flower. The well-known *Eucryphia pinnatifolia* is covered with pretty white flowers. It remains attractive even after the petals have fallen by having persistent stamens which give a pleasing effect. Shrubs and trees which are grown for their bright berries and beautiful autumnal foliage are now commencing to colour. *A. McCutcheon*.

THE MAINTENANCE OF PERMANENT SOFT WOOD SUPPLIES IN NORTH-WESTERN EUROPE.*

THE importance of an adequate supply of soft-wood timber is greatest in those countries in which industrial development is most advanced, building and railway construction, colliery requirements, paper pulp, and packing boxes representing the main purposes for which Coniferous soft woods are used. With the exception of Germany and Italy, the industrial countries chiefly relying upon supplies of soft wood imported from northern Europe are those lying along the north-western sea board, including Belgium, Denmark, France, Holland, Great Britain and Ireland. These countries have the lowest area of forest per head of population and would feel most acutely any serious shortage. Their annual imports are, according to Mr. Fraser Story, about 600,000,000 cubic feet, their total consumption nearly 1,200,000,000 cubic feet. This does not include pulp wood or hard-wood. Great Britain takes nearly two-thirds of the total import. The normal increment from 7,500,000 acres of Conifers, of which about 66 per cent are privately owned, is about 300,000,000 cubic feet, so that there is an apparent over-felling, or reduction of the capital stock, equal to 25 per cent. of the total consumption.

Northern Europe possesses about 300,000,000 acres of Coniferous forest capable of producing, under proper management, the whole of the industrial deficit elsewhere in Europe for all reasonable time. Sweden and Finland possess one fourth of this area, and their forests are conservatively managed. Russia is at present an uncertain quantity. The present exports from northern Europe of about 800 to 900 million cubic feet could not be greatly increased at present without over-felling.

The chief measures most likely to assure the maintenance of an adequate supply of soft woods are:—

(1) Better protection against fire, and more

intensive management of the existing forest area.

(2) The conversion of unprofitable hard-wood areas into Coniferous forest.

(3) The afforestation of land possessing a low agricultural value.

(4) The lowering of the *per capita* consumption of soft-wood timber by substitutes such as ferro-concrete, ply-woods and pulp from hard-wood timber, etc.

The high percentage of privately owned forest in most parts of Europe suggests a more adequate control of all forest land by the State, leading to more intensive management and the prevention of over-felling. Afforestation of poor land is a State enterprise, and cannot be effected without legislative measures. The discovery of substitutes for Coniferous wood is a matter for research and investigation.

The possibility that population and industrial activity in Europe have reached their *maxima*, and that present estimates of future timber consumption may be excessive, must not be left out of account.

TREES AND SHRUBS.

PRUNING.

ALTHOUGH the abundant rains and cool conditions experienced have assisted growth enormously, and helped to repair the very considerable damage done by the late spring frosts to the young shoots of trees and shrubs, it is desirable at this season to thin out growths where they are crowded, and shorten long shoots. This year, instead of writing that such work is desirable, it would be more to the point to write *necessary*, because of the abundant growth.

The question of pruning is in many gardens considered largely in relation to fruit trees and bushes, and Roses, whereas, if the full beauty of ornamental flowering and foliage trees and shrubs is to be obtained adequate pruning must be practised.

The general term, "pruning," includes not only the shortening of branches, but the cutting out of old stems and weak, twiggy shoots, and thinning, when the trees and bushes are overcrowded with branches and twigs. One important object in thinning is to admit light and air among the branches, and so to improve the health of the individual, the beauty of its foliage, and often the quality and probably the quantity of the blossoms. Pruning also often becomes necessary to prevent shrubs outgrowing their positions or crowding their neighbours.

Just now it is important to attend to the leaders of young trees, securing these to stakes to prevent damage by gales in winter, and to shorten side-shoots, which may develop into rival leaders, or tend to destroy the balance of the specimen.

Stress of work in other directions at the time often means neglect to cut out the old flowering growths from the *Philadelphuses*, spring-flowering *Spiraeas*, *Deutzias*, *Kerrias* and similar shrubs when the flowers are over, but an effort should be made to attend to such work without delay so that the autumn sunshine may penetrate among the branches and complete the ripening of the young wood.

September is a suitable time in which to attend to the pruning and thinning of deciduous trees. The operator should not hesitate to remove small branches right back to the main trunk of growing trees, rather than prune the stronger branches to give space for the weaker. The aim should be to obtain a limited number of strong, healthy branches, well placed on the trunk, rather than numbers of crowded branches. The removal of dead branches and twigs is another matter which should receive immediate attention. Before the leaves on the deciduous trees take on their autumn tints and fall, it is easy to distinguish living branches from those that are dead or unhealthy and decide where it is best to cut them off.

Specimens of Holly, Yew, Box, the evergreen Oaks, the Bay Laurels and similar evergreens—the growths of which it is usual to keep somewhat formal, but not closely clipped with shears—

* Summary of a paper read by Mr. A. C. Forbes at the meeting of the British Association on September 5th.

have made exceptional growth during the last two months; therefore the work of shortening the long growths to side-shoots, or cutting out a few of the longest branches entirely to maintain well-balanced specimens needs prompt attention.

In mixed shrubbery beds and borders considerable pruning and thinning are necessary to prevent crowding. The branches of strong-growing and perhaps common, though attractive, shrubs may be growing into or over less robust and choice subjects. It frequently becomes necessary to cut away common shrubs as choice specimens increase in size. In explanation of this I may quote as examples the cutting back of *Cotoneaster Simonsii* that is impeding the development of a healthy bush of *Hamamelis mollis*, and limiting the branches of *Cornus alba* growing into *Cornus Kousa*.

Climbers on walls, fences, pergolas and arches need attention before winter arrives. Tie in the growths to be retained, and shorten

hence they only increase slowly in size. It is thus desirable to prepare the ground thoroughly previous to planting by deep trenching and manuring, adding plenty of turfy loam, if the soil is poor, and chalk or old lime and mortar-rubble if there is a shortage of lime in the ground. Mulching the roots with decayed manure or watering them with liquid manure so soon as the flowers fade is very beneficial to the trees. One reason, no doubt, why these Cherries flower so freely is that most of the varieties have double, or semi-double, blossoms, and do not produce fruits, with the result that so soon as the flowers fall, the growth of the tree is centred on the development of flower buds for the following spring and new growth.

With one or two exceptions, the very many Japanese named varieties belong to either *Prunus Lannesiana* (Fig. 105) or *P. serrulata*. A selection of six of the best and most distinct varieties is as follows:—*Hizakura*, the best rosy red variety; *Sieboldii*, a free-flowering pink

added when preparing them for planting, while those of a very heavy nature may, in addition, receive a dressing of rubble or other coarse, gritty material.

Lilacs are surface-rooting plants and a mulch of decayed manure to conserve moisture during the growing season is highly beneficial. It is unreasonable to expect them to flower satisfactorily when planted under other trees, and only open, sunny positions should be chosen for them. The pruning of the bushes is a matter which frequently receives scant attention, and should be done immediately after flowering by removing the trusses of flower, cutting back to promising buds or growth, and removing thin and weak wood so that a reasonable number of strong, healthy growths may develop which will have every chance to set and ripen flower buds for next year's floral display.

Propagation may be effected by layering and cuttings, and these methods have advantages in that there is not the defect of suckers,

FIG. 105.—PRUNUS LANNESIANA.

or cut out shoots not required. Though the growths of *Wistarias* may have been shortened once or twice, they need still another "spurring," so free has growth been of late. Because of their beautiful autumn colour it is not desirable to do much pruning to the ornamental vines on pergolas and arbours, but a certain amount of tying and tipping of young shoots is desirable to prevent, so far as possible, damage from wind and heavy rains.

THE JAPANESE CHERRIES.

AMONG the smaller-flowering trees, the Japanese Cherries possess a distinctive beauty, rivalled by few, and surpassed by no other family. They are valuable alike for small gardens and very extensive pleasure grounds, either planted singly, with, preferably, an evergreen background, or in groups of three to six or more trees.

Small budded or grafted trees, not more than three feet high, often flower freely, notably in the case of Waterer's Japanese Cherry, *Prunus Sieboldii*. In fact, the trees often flower so freely that they make very little new growth,

sort; *Temari*, pale semi-double pink; *serrulata*, distinct in growth, with long, horizontal branches studded with large, double white blossoms in early May; *grandiflora* (syn. *flore luteo pleno*), distinct, yellowish-green flowers; and *pyramidalis*, with upright, Lombardy-Poplar-like growth, and delicate pink flowers. A. O.

LILACS.

LILACS are general favourites among spring flowering shrubs for both large and small gardens and "Lilac-time" is looked on as one of the most delightful periods of our beautiful English springtime. Shrubs of graceful habit and free-flowering qualities, they are very attractive when in flower, and present a neat appearance in the shrubbery during the remainder of the summer. Small bushes are also extremely useful for forcing during the winter, for which purpose they are particularly suitable. They succeed in almost all types of cultivated soil although they have a decided preference for a good, medium loam. Soils lacking in humus should have liberal quantities of organic manure

but plants raised in this way take several years to reach useful size, and grafting is more often practised.

The present-day varieties of Lilacs are remarkable for the large size of flower and effectiveness of the inflorescence, and most of those popularly grown are of continental introduction. Whereas the colouring in the earlier varieties was almost restricted to white and purplish-lilac the range is now considerably widened and includes many shades of rose, red and crimson. *Marie Legraye*, with large, single, white flowers, and *Charles X*, with blue flowers and reddish buds, are two of the best sorts for forcing in pots because of their floriferous habit, and they may be counted worthy of inclusion in any collection. Amongst other single varieties of great merit are *Congo*, with long and wide trusses of a fine red colour; *Hugo Koster*, large purplish-crimson; *Lavannesis*, pale pink; *L'Oncle Tom*, dark crimson; *Madame Francisque Morel*, an attractive violet-pink; *Reaumur*, broad trusses of dark crimson; *Pasteur*, long-panicked claret-red, and *Souvenir de Louis Späth*, rich vinous crimson.

The double-flowered varieties are also very

beautiful and include Abel Carrière, large blue flowers; Alphonse Lavalée, blue, shaded violet; Condorcet, long, massive trusses of lavender flowers; Emile Lemoine, pink; Madame Abel Chatenay, long, white spikes; Madame Casimir Périer, very fine creamy-white trusses; Michael Buchner, rosy-lilac, and Marc Micheli, with enormous trusses of soft azure-blue flowers. A. P. C.

BROWN-ROT DISEASES OF FRUIT TREES IN 1926.

THE brown-rot diseases of fruit trees caused by *Sclerotinia cinerea* and *S. fructigena* were unusually prevalent during 1926. The wet spring favoured infection of the flowers by *S. cinerea*, and blossom wilts were common in consequence, while in late summer infection of ripening fruit by *S. fructigena* was responsible for considerable loss.

Blossom-wilt of Cherries (*Sclerotinia cinerea*) was an instance illustrating the effect of weather conditions on the incidence of disease. Early varieties were in flower during a brief fine period which favoured pollination and early setting. A period of dull, wet weather with low temperatures then set in, which not only favoured the development of the blossom-wilt fungus, but also produced conditions unfavourable for bees, so that pollination was retarded, and since the flowers remained open for a long time they were more liable to infection. Thus, in one orchard, visited in May, the variety Early Rivers, which had been in flower during the sunny period when bees were active, gave promise of a good crop, while other, later varieties, such as Kentish Bigarreau (Amber), Florence and Napoleon, were very badly infected with blossom-wilt.

Morello Cherries (Fig. 106) particularly suffered in this way for they were in flower for about four weeks; throughout this period they were liable to infection, and in plantations where dead infected wood had not been cut out before the flowers opened the result was disastrous.

Visits were paid in spring to a number of Morello Cherry plantations where blossom-wilt was prevalent. In one plantation of about 1,000 trees in the neighbourhood of Maidstone, every tree (with the exception of two or three very young trees with few flowers) showed blossom-wilt and recently killed twigs. An attempt had been made to cut out the dead wood of the previous year's infection, but it had not been thoroughly carried out, for most of the trees showed one or more old dead twigs bearing the fungus, and it was observed that most of the wilted trusses of flowers were in close proximity to the fungus-bearing twigs. In another plantation on the same estate the trees had received no attention whatever and no attempt to cut out the dead wood had been made; on these all the blossom trusses were killed by blossom-wilt infection (either directly, or indirectly by the death of the twigs), and the trees had the appearance of having been swept by fire.

On another farm near Maidstone a plantation of some two hundred young Morello trees (five years old) were seriously affected by blossom-wilt.

A plantation of five or six hundred Morello Cherries, about fifteen years old, in the north-west of the county, was also visited. In this case practically all the flowers were withered and many branches were being killed back. I was told that there had been a slight attack of the disease in 1925, but that owing to pressure of other work, the necessary cutting out of dead wood had been neglected, with the result that this had served as a source of infection for the 1926 crop.

That the very unfavourable weather conditions were an important factor in these epidemic outbreaks is undeniable, but a great deal of the infection could have been prevented if the precaution had been taken to remove all the twigs killed the previous year, as shown by the fact that even where the cutting out had been im-

perfect there was considerably less infection than in those cases where it had been omitted altogether.

As the flowering period was so prolonged the flowers which opened early became infected and these soon produced masses of spores which also served as dangerous sources of infection for the flowers which opened later.

Certain varieties of Plums were also seriously infected with blossom-wilt, and "wither-tip" (particularly in Victoria Plums) was prevalent.

An instance of wither-tip (infections, followed by withering, of the young, green shoots) was found on a Myrobalan hedge; no particular harm was caused in this case, and its chief interest lies in the fact that such diseased shoots, occurring in unexpected places, are easily overlooked and might serve to infect the more valuable fruit trees.

Wither-tip in Cherries (Fig. 107) is much less common than in Plums, but examples were found on young trees at East Malling; during the winter these produced pustules of spores on the dead shoots as in the case of Plums. On a plot of "maiden" Cherry trees (variety Napoleon) the leading shoots were killed back in this

trees, was again responsible for much rotting of the fruit. Though usually associated with the "core-fruit" (Apple, Pear and Quince) it caused much rotting of Plums, and at East Malling was responsible for more rotting of the Plum crop than *S. cinerea*. *S. fructigena* was also found on the fruit of Cherry Plum (*Myrobalan*) and of Morello Cherries.

The prevalence of *S. fructigena* in late summer made careful picking and sorting a necessity if the fruit was to be marketed or stored. Cases were noted where Apples had been picked from the stalks instead of *with* the stalks, with the result that the brown-rot fungus immediately set in at the wound, and there was conspicuous rotting within two or three days after picking, the rot in these cases starting at the stalk end. The variety in which this type of infection was observed was James Grieve, an Apple very susceptible to brown-rot.

Although *S. fructigena* invariably (so far as is known at present) infects through the fruit, in certain soft-wooded varieties of Apples, it can extend from the fruit into the spurs and branches and so cause cankers. Specimens of dead spurs of James Grieve received from

FIG. 106.—BROWN WILT OF MORELLO CHERRY.

way on about half the trees. Wither-tip was also seen on large, established trees in the neighbourhood of East Malling.

A disease of a Japanese flowering Cherry (*Prunus serrulata*), killing back the tips of the branches, first observed in 1925, was again noted in 1926. Laboratory cultural methods showed that (as in 1925) the mycelium of *Sclerotinia cinerea* was present in the dead twigs, and the inference is that this fungus is the cause of the disease. An unusual form of disease was found on some Kentish Red Cherry trees in the Weald. Certain parts of the branches became unusually swollen; the bark below these tumourous-looking outgrowths was brown and dead. On placing particles of this diseased bark on culture plates the fungus *S. cinerea* grew out and the probable explanation of the abnormal condition of the branches is that infection took place through the blossoms; from the flowers the fungus extended into the bark of the twigs and killed it, while the wood continued to convey sap to the parts beyond the infected area. Infection thus caused a type of natural "ringing" and there was an accumulation of food material above the injury with hypertrophy of the tissues.

Blossom-wilt of Apple trees (*Sclerotinia cinerea* f. *mali*) was again serious in places. The Lord Derby variety is particularly susceptible to this disease, and trees of this variety on two farms at East Malling were seen, during the winter of 1926-7, with numerous cankers and dead spurs bearing the fructifications of the fungus.

Sclerotinia fructigena, the common brown-rot fungus which infects the fruit of Apple and Pear

Essex during the winter bore barren fungal pustules, particles of which, when transferred to culture plates, gave rise to typical cultures of *S. fructigena*. H. Wormald, Plant Pathologist, East Malling Research Station.

THE SELECTIVE ACTION OF TETRACHLORETHANE AS A GREENHOUSE FUMIGANT.

THAT tetrachlorethane may be used with success as a fumigant for White Fly (*Asterochiton vaporariorum*) in greenhouses was pointed out by the present writer in 1920 (*Annals of Applied Biology*, 1921), who was then investigating this pest at the Cheshunt Experimental Station. It was, however, at that time difficult to obtain the material in quantity, and it was expensive, while samples varied in colour and in odour, so that it was suspected that possibly free chlorine might sometimes be present in amounts that would be deleterious to plants. Its cost then, possibly still, made it no more than a curiosity to the commercial grower who has to deal with cubic feet by the hundred thousand. Cyaniding was cheap and certain, and, if proper precautions were taken, not seriously harmful to plants, while more up-to-date methods of applying the gas have now removed some of the mechanical difficulties

which existed seven years ago. For these reasons only tentative experiments were then made with tetrachlorethane at the Cheshunt Station, and it is interesting to learn from notes and advertisements in gardening journals that it is taking its proper place—not a primary place—as a greenhouse fumigant. Owing to its non-poisonous nature and simplicity of application it is certainly a very tempting substance for use by the gardener with only a small quantity of glass.

The reason why these notes are written is that in a recent article on greenhouse fumigation by Mr. Theodore Parker (*The Gardeners' Chronicle*, June 18, 1927) it is stated that in using tetrachlorethane "it should be carefully noted that certain plants are particularly susceptible to its fumes, and it should not be used under any circumstances in houses containing Chrysanthemums or Cinerarias; there are other plants which are only partially affected." In these words, Mr. Parker justifies a misgiving which the present writer had and expressed because during one fumigation in a greenhouse of mixed plants (Dr. Bewley's experimental house) there happened to be two young Sycamore seedlings in pots and some days after the fumigation these turned sickly and shed all their foliage, this being the only instance of damage that was recorded. It was evident that if one species of plant suffered others not tested would probably do so also, for one could not imagine that Sycamores alone would be susceptible.

Why is it then that the vapour of tetrachlorethane is selective in its damaging action on plants? As one thinks of other gases which harm vegetation if used in sufficient quantity, such as hydrocyanic acid gas, sulphur dioxide, chlorine, the vapours of phenol and cresol, none springs to mind which has the same type of selective action. In any one test with such definitely poisonous substances some plants may be damaged and others not, but it is more a question of the degree of sappiness or softness that decides whether burning will occur, rather than of species, in these cases. But tetrachlorethane is selective in its action on insects also, for, as Mr. Parker points out, it does not seem to affect green fly. Does not this analogy give some hint as to why it damages some plants and not others?

All stages of the white fly are covered with wax, mealy in the case of the adult and egg, smooth in the larvae and pupal stages, except at the porous areas through which the insect breathes. Tetrachlorethane is a wax solvent, and it is fairly certain that its action on white fly is dependent on this property. Its vapour causes the wax to "run" and so upsets the delicate mechanism of breathing in the fly and its larvae. It is probably that it is not a tissue poison in the proportions used, since if it were one can hardly conceive that the green fly should escape its action. Its effect, especially on the pupae of white fly, is of interest in support of the idea that it is not a tissue poison. The pupae are enclosed in waxen cases, like raised meat pies, in which there are natural lines of rupture, as between the lid of the pie and its sides. The vapour of the tetrachlorethane fuses the wax along these lines of fracture, and days after the fumigation, when all perceptible traces of the chemical have gone from the house, the white fly adults are found endeavouring to escape from their cases, and dying half way out because the lines of fracture of the wax have been destroyed. When a tissue poison such as hydrocyanic acid gas is successfully used, however, they die in their cases, having made no attempt to emerge.

Is tetrachlorethane then a tissue poison to Chrysanthemums and Cinerarias, or is it entirely a mechanical poison, as is probably the case to the white fly? The foliage of these plants certainly feels waxy to the touch, but whether there is a demonstrable wax on it the writer is not aware, and, as these notes are written in the hinterland of Nigeria, the writer cannot test it, for there are here, alas! no glasshouses nor Chrysanthemums nor (not wholly alas!) pest-fostering Cinerarias. The question of this selective action of tetrachlorethane for plant and insect offers a pretty subject for research to one who has time and opportunity. *Ll. Lloyd.*

Gardens of the Dead.*

THE "cult of the dead" which finds expression in varying degree and in different forms among practically all the peoples of the world, from the most primitive savages to the most highly civilised of nations, has its happiest development in those countries where a love of gardening and of flowers is characteristic of the inhabitants, and is closely associated with their reverence for and remembrance of those who have "passed on."

This is especially the case in Germany, where every evidence of loving and anxious care to make a real "God's Acre" is to be found equally in the smallest country church-yard and in the extensive and numerous cemeteries on the outskirts of Germany's big and rapidly growing industrial towns.

FIG. 107.—WITHER TIP OF SWEET CHERRY.

In fact, cemetery gardening is a matter of so much interest among German municipal horticulturists that it is not surprising to find that a book has been published upon the subject. It is entitled *Die Praxis der Friedhofsgärtnerei*,* and is from the pen of Josef Hempelmann, a landscape gardener well qualified by practice and by long study to write on the special problems which confront the cemetery gardener—problems which have much in common with those of ordinary public park gardening, but are not by any means identical. The great difficulty to be met is that of reconciling general good taste and the necessity for creating a fine *ensemble* with a due regard for the susceptibilities of the bereaved, and with the wide latitude they naturally expect in the way of flower-planting and monumental masonry. In this country the artificial wreath is seldom seen,

* *Die Praxis der Friedhofsgärtnerei*. Von Josef Hempelmann, Berlin; Paul Parey, Hedemannstrasse 10 and 11. Price 19 marks.

and is prohibited in many of the larger English cemeteries, to the great improvement of their appearance. In France and Belgium such action would be impossible, as wreaths made of beads and other durable materials are almost universally employed, especially in the provinces. This difficulty, however, does not appear to have arisen in Germany; real flowers seem to be employed as a matter of course, and in the way of headstones and monuments public taste would appear to be sentimental and slightly materialistic rather than definitely bad.

The author reminds us that flower decoration and flower cultivation in connection with the graves of the dead is no very ancient custom. It was unknown in the Middle Ages, when the favourite place for burial was inside the church, preferably immediately beneath or in front of the altar. It was only when such spots, being limited in number, were filled, that, for lack of room inside the church, graves were made outside, huddled as close to the sacred walls as possible. Gradually the extent of the graveyard widened, until in comparatively recent times the phenomenon arose of a cemetery apart from the church, and even some way from the centre of population—a necessity born of the tendency of an industrial age to concentrate in towns instead of having the population scattered over the country in small communities.

Apart from the decorative value of flowers and their aesthetic appeal, their easily grasped symbolism led to their rapidly becoming popular in association with the idea of death and the desire for immortality. While this association is likely to persist indefinitely public taste is all the time improving, and encouraging the municipal authorities to make of the cemeteries under their control more and more of pleasant, peaceful open spaces or gardens, and less of mere graveyards. That this tendency has had full scope in Germany during the past twenty years at least is fully demonstrated by the illustrations in the volume before us, some of which it is difficult to believe were not taken in some private park or garden of more than ordinary natural beauty. Everything, even of the most utilitarian nature, is turned to account to add to the beauty and restfulness of the scene. One recalls with displeasure the ugly standpipes which disfigure so many cemeteries, when one considers the simple, perfectly artistic little fountain and basin in Fig. 66, or the charming "Spring by the Wayside" shown in Fig. 67. Even a drainage ditch can be made beautiful at no great expense by the judicious planting of Rushes and the provision of a pretty, single-span, brick-built bridge (Fig. 20), while nothing could be happier or more harmonious than the little gabled chapel with a separate open timber bell tower (Fig. 64), designed for a country cemetery near Düsseldorf. In a country like Germany where forestry is taken so seriously and woodland scenery so greatly admired, it is not surprising to find that some of the finest cemeteries are of a woodland character, though a forest site presents many difficulties. A general desire is commonly expressed by those purchasing positions for graves to have them in the cool, restful shade of the trees. Later, however, when the grave is established, it is natural to wish to plant it with flowers—even Roses, for example, for which bright light and the free play of the air are so necessary. Then, in the autumn, there is always the difficulty of the fast-falling leaves, of which it is impossible for the personnel of the cemetery to keep the graves at all times free. Certain kinds of woodland are out of the question for cemetery use—for instance, Beech, on account of its early and copious leafing, which shuts out all light from the ground below. Oak is better, as it assumes its foliage later, and the leaves by their uneven shape permit of more light filtering through. Of Conifers, Pine is the best, Fir being again too dark. Another disadvantage of the forest site is that the ground is nearly always damp, necessitating extra careful drainage; furthermore, the trees absorb so much nourishment that if ample undergrowth is to be maintained, manuring has to be resorted to.

All these and many more difficulties, however, have been triumphantly overcome in the case of the Sennefriedhof, Bielefeld, and many others,

which, although laid out in some cases only a decade or so ago, have already assumed a settled and permanent appearance, which reflects great credit both on architect and on staff. To those among our own municipal gardeners who read German, this book will be a delight, dealing as it does so fully with every aspect of cemetery lay-out and upkeep, even to small details, such as the provision of rubbish receptacles and the best ways to exclude prowling cats. The book is beautifully printed on art paper, and every one of the 191 illustrations is a work of art in itself.

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, Ante pp. 131-137)

(Continued from p. 214).

MIDLAND COUNTIES.

BUCKINGHAMSHIRE.—The fruit crops are, on the whole, disappointing. With the exception of Apples, all the crops are much below the average, mainly due to the exceptionally dry spring and severe frosts during the flowering period. Pears are very scarce, and we have no Plums. Strawberries, Raspberries and bush fruits improved with the summer rains, but were much below the normal yield. Peaches, Nectarines and sweet Cherries gave fair yields in places, but Morello Cherries dropped badly during the stoning period. *F. Reid, Dropmore Gardens, Burnham.*

CHESHIRE.—As last year, there was a splendid show of blossom in this part of north Cheshire along the Mersey valley, but the usual frosts came about the beginning of May and ruined the bulk of the Pear, Plum and Damson blossoms. About May 8 Apples were setting well, but weeks of cold wind and a dry spell till May 31 caused many of the fruits to fall. However, varieties such as Charles Ross, James Grieve (a favourite about here), Rival and Keswick Codlin, are now looking well after the copious rains, and given some hot sun there should be crops well above the average. Black Currants, Raspberries and Loganberries all fruited nicely and Strawberries bloomed well. We are favoured with good, rich soil, and plenty of small fruits are grown in this district for the neighbouring Manchester market. *C. E. Arden, Eagle Brow, Lymm.*

—Severe frost in April when Pears were in full bloom resulted in the crop being almost a complete failure, except on walls in very sheltered places. Apples are rather better than of late, especially the varieties Lord Grosvenor, Emmett's Early, Jubilee, Newton Wonder, Bramley's Seedling, Kentish Fillbasket, Victoria, James Grieve, Worcester Pearmain, Allington Pippin, and Charles Ross. Strawberries were almost a complete failure, being the poorest crop on record, in spite of the plants having received more attention in cultivation than usual, with a view to overcoming the deterioration that has been so marked of late years. Black Currants, in spite of having received less attention were better, both as regards quantity and quality, than for some few years. No digging whatever was done amongst the bushes this year. Bushes sprayed with tar wash were remarkably good. Red Currants, too, sprayed with tar wash, suffered less from the birds taking the buds, and have cropped remarkably well. *S. A. Summerfield, Alderley Park Gardens, Chelford.*

—On our sandy loam, the excessive wet weather of the spring and summer has not had such a retarding effect as on some of the stiffer, holding kinds, on some of which fully half of the crops have fallen prematurely. Our crop of Apples of most varieties is excellent, especially Lord Grosvenor, Stirling Castle, Maltster and Striped Beefing. Pears, owing to earlier blooming, were caught by the frosts, and

Plums were also ruined. The crops of small fruit—Gooseberries, and Currants—were up to the average. Strawberries, Raspberries and Loganberries were better than for some years past. *Alfred N. Jones, Marbury Hall Gardens, Northwich.*

—The Apple and Pear crops here are above the average, but some of the varieties caught the 8° of frost which we experienced on April 29. Much of the foliage was damaged and many of the trees have not yet recovered from it. Strawberries were a splendid crop, but the daily heavy rainfall did much damage to the fruits before they became ripe. Gooseberries and Black and Red Currants were good crops, and the foliage is free from disease. Raspberries were plentiful. Morello Cherries were good, but Sweet Cherries and Plums were failures. Our best Apples this year are James Grieve, Worcester Pearmain, Irish Peach, Ecklinville, Lane's Prince Albert, Warner's King, The Queen and Annie Elizabeth. Our best Pears are Williams's Bon Chrétien, Emile D'Heyst, Pitmaston Duchess, Beurré Diel, Marie Louise D'Uccle, Beurré de Capiaumont,

FIG. 108. RASPBERRY EXETER YELLOW.

Marie Louise, Conference and Catillac. The cold, wet weather that now prevails is keeping fruit and all kinds of vegetation back. The growths on fruit trees and bushes are greatly retarded. If the weather does not become warmer, I am afraid many of the fruits will drop. Our soil is a heavy red loam on a subsoil of sand. *James B. Allan, Tirley Garth Gardens, Tarporley.*

DERBYSHIRE.—Our soil is stiff loam on clay and this garden is situated 480 feet above sea level. After light crops last year, trees of Blenheim Pippin, Worcester Pearmain and Lord Suffield Apples are cropping heavily. Pears withstood the severe frosts in a remarkable manner, but Plums and Damsons, which had passed the flowering stage, succumbed to the frost, with the exception of Pershore, which in most positions is carrying a good crop. Strawberries were badly damaged although the flowers were not open. Black Currants and Raspberries greatly improved after heavy rains. *William Parks, Whittington Hall Gardens, Chesterfield.*

(To be continued).

FRUIT REGISTER.

RASPBERRY EXETER YELLOW.

THERE are several yellow Raspberries in cultivation, but they are not very popular with growers, although a dish makes a pleasing addition to the dessert table. Amber Queen is one of the most popular varieties, and there is a yellow form of Superlative known as Guinea, whilst the newer Yellow Hornet is quite one of the best of the yellow sorts, and received the R.H.S. Award of Merit on August 12, 1919, after trial at Wisley.

At the meeting of the Royal Horticultural Society on July 19 last, Messrs. R. Veitch and Son showed a very large Raspberry of this colour named Exeter Yellow (see Fig. 108). Mr. P. C. M. Veitch stated that it originated as a chance seedling in his firm's nursery. He brought to the meeting several sprays, including the one illustrated, which showed that it is a very free-fruited variety, and as the berries are large and handsome in appearance as well

as of good flavour, the Fruit and Vegetable Committee recommended the variety to be included in the trial of Raspberries at Wisley.

APRICOT ST. AMBROISE.

ADMITTEDLY not so good as Moorpark, St. Ambroise is, nevertheless, a very fine Apricot, rather earlier than the better-known variety, for it ripens in mid-August. The tree is a prolific cropper. The fruit is large, compressed, of deep yellow colour, with a red flush on the side next to the sun. The flesh is richly flavoured and sugary.

The tree grows rapidly and vigorously when planted against a south wall, and is, possibly, the most prolific and the most vigorous of all Apricots.

PLUM DENNISTON'S SUPERB.

THIS is a dessert fruit of the highest quality and a Plum that merits recognition wherever choice fruits are appreciated; the fruits are of medium size, roundish-oval, a little flattened and with a very distinct suture extending right round the fruit. The skin is pale yellowish-green with a very few thin, scattered, purplish

blotches and dots covered with a thick bloom; the stalk is inserted in a small cavity and is about three-quarters-of-an-inch long. The flesh is yellow, rich and juicy and adheres to the stone.

The tree grows admirably as a bush or as a fan-trained specimen against a west or south wall; it is a reliable cropper and the fruits ripen about mid-August.

This Plum is of American origin, and was raised by a Mr. Denniston, of Albany, New York. *Ralph E. Arnold.*

HOME CORRESPONDENCE.

[The Editors do not hold themselves responsible for the opinions expressed by correspondents.]

Night-Scented Stock.—There seems to be a perennial as well as an annual Night-scented Stock. I have looked up many references to these. The perennial one is *Matthiola tristis* of some, *Hesperis tristis* of others, and is a plant difficult to grow and propagate. In *Annals*, in "Present-day Gardening Series," M. tristis is classed as an annual and advised to be treated like Mignonette, which must be wrong. Mr. Bowles, in *My Garden in Summer*, gives most enlightenment. He states that *Matthiola tristis*, "the old Night-scented Stock of one's great-grandmother, is another half-hardy indispensable, for I think its scent the sweetest of all those produced by the dingily coloured plants that wake up towards evening and advertise for moths to undertake their pollen dispersal in return for a supply of nectar, and so distil the most wonderfully alluring scent to attract them. This little perennial, bushy Stock is not much to look at, with its narrow, grey leaves, and spikes of small lilac and brown flowers, but it beats all the rest of the family in its scent, which has more of Cassia-buds and Russia leather about it than the Cloves or Friar's Balsam I detect even in *Matthiola bicornis*, good as its evening offering of incense can be on a still summer night." *Matthiola bicornis* I have known for many years as the Annual Night-scented Stock, and for many years I have grown it in the gravel under the windows of my home. At the end of April I take an ordinary hoe and scratch, a few inches from the wall of the house, a triangular drill an inch or so deep, and in it sow, very thinly, seeds of this Stock. It always grows well. During the day it is not pretty, but it wakes up in the evening, and for many hours its small, Cruciferous, lilac and white flowers remain open and flood the surrounding atmosphere with sweet perfume. If doors and windows are open the scent penetrates the house and continues through the darkness. In the gardens of homes for the blind I am sure this would be a welcome plant, and to any such institutions I would gladly send some seeds if the management wrote to me. *Wm. Cuthbertson, Duddingston, Midlothian.*

Lilium Farreri.—An old Latin proverb states that "it is the nature of every man to err, but of none but a fool to persevere in error." Bearing in mind the plain truth of these words, I hasten to express my grateful thanks to Sir Herbert Maxwell for his correction (*Gard. Chron.*, p. 188) of my notes on *Lilium Farreri*, remarks in which I misinterpreted Mr. E. H. Wilson's *Lilies of Eastern Asia* re the Martagon group.—*L. B. C., Cheshire.*

Slugs.—In order to get the traps (the "Any-pot trap" I described some years ago) more regularly rebaited, I instituted a measuring glass into which the "bag" is ladled when the traps are attended to. The records show that from Nov. 25, 1926 to April 1, 1927, we took 14 pints over certain parts of the garden. In August measuring was again instituted, and already by September 3, we have 4½ pints, but regions which were cleared earlier now give poor bags, which is some satisfaction. If I were writing to a well-known contemporary, I suppose that I ought to append, "Is this a record?" *H. E. Durham.*

SOCIETIES.

DEESIDE (ABERDEENSHIRE) FIELD CLUB.

FAVoured with radiant weather, nearly 260 members of this club visited, with the kind permission of Mr. and Mrs. Baird, the famous woods of Durris, near Aberdeen, on Saturday, the 3rd inst. The large party was, owing to the indisposition of Mr. Baird, received by Mrs. Baird, who extended a hearty welcome to the visitors. The Marquis of Aberdeen and Temair, President of the Club, expressed the great indebtedness of the members for the warm welcome they had received to such lovely surroundings. For generations past these woods have been carefully and systematically supervised, with the result that to-day there are no finer in the Three Kingdoms. Continental experts who have paid visits here have been amazed at the magnificence of Durris woods. The present proprietor, Mr. Baird, himself no mean authority on forestry matters, has worthily maintained and greatly added to the high traditions bequeathed to him.

The outstanding feature of the day was the address given by Mr. John Michie, M.V.O., President of the Aberdeen Branch of the Royal Scottish Arboricultural Society, and for many years head forester, and, latterly, Commissioner, on the Royal estates of Balmoral, and now retired. That finest amalgam of all, practice and theory, was conspicuous all through Mr. Michie's remarks. He considered the woodlands of Deeside and abutting glens compared favourably with any others in Scotland, not excepting Speyside and the Black Wood of Rannock. These were natural woods constituting only remnants of the great Caledonian Forest of ancient times. Scots Pine (wrongly termed Scots Fir) was the great tree of these forests, and many good specimens might yet be seen, sown by Nature's hand, in Mar Forest, Ballockbuie, Glentanar, in Upper Deeside. No doubt in the ancient natural forest of Dee, in addition to the prevailing Pine, there had been parts occupied by Birch, Oak, Aspen, Willow, in soft ground, and Alder on the banks of streams. But, although the glory of the ancient forest had departed, they had evidence of its grandeur in the peat bogs. For generations past, heartwood logs of the Scots Pine, large and small, had been dug up in the getting of peat fuel. One, two and even three tiers had been found in different strata, with traces of Birch and the other trees, chiefly in the form of leaf impression and bark, the wood, as a rule, having decayed before being buried in the bog growth, but so indestructible was the heartwood of the natural Scots Pine that it remained sound till the sapwood had perished and vegetable growth, forming peat, had sealed it up against destruction.

Up till comparatively recent times, the only kind of wood treatment they knew of in this country was that of vandalism, except, perhaps, in the case of homesteads, where it was considered necessary to plant a few Ash trees for spear shafts, presumably to keep the Sassenach at bay, or for use in the feuds between clans. Later on, the Ash was found to be useful in the construction of implements of peace.

Then the time came when the good old landed proprietor began to see things in a proper perspective. Deeside was not by any means behind the rest of Scotland in the planting of trees. Beginning as near the source of the river Dee as tree growth would succeed to reach timber size at the present day, Mr. Michie proceeded to discuss the sylvicultural position as it now stood. One often heard, he said, that the timber line was so-and-so—meaning the height above sea-level that trees would grow to timber size. He emphasised the fact that this timber line was really as high as, if not higher, on the upper reaches of the Dee than in any other part of Scotland, the reason being that neighbouring mountains were generally more lofty.

After dwelling on the fine quota the Deeside lairds had contributed to the timber shortage during the war years, and declaring the Deeside valley still compared favourably with other sylvan parts of the country, Mr. Michie referred

to the steps now being taken to rehabilitate the areas cut over. He reminded his hearers of the great expense this work entailed, including fences, and combating the attacks of injurious insect pests that followed the complete cutting of all woods. Fortunately, all along the Dee valley there were many plantations too young to be sacrificed for pit props, and this accounted largely for the rather better woody covering of Deeside to-day compared with many of the glens and straths in Scotland, notably the Tay Valley, where whole hillsides had been denuded.

Coming to deal with Durris woods, and what his hearers had seen that day, Mr. Michie said that the cultivation of newer exotic Conifers, as well as other foreign trees, had not been neglected on Deeside, and nowhere were these to be found in greater variety and better managed than on the estate of Durris. The great majority of these might be said to be more ornamental than fitted to contribute to the timber supply of Britain, but there were at least two species which had become established as valuable forest trees in this country, and on Deeside in particular, but more particularly still on the estate of Durris. He referred to the Douglas Fir and Sitka Spruce, and had no hesitation in saying that they, at least, were destined to rank high in our future timber production. In no part of the country could these trees be seen better than at Durris. On Durris, the Douglas Fir readily produced cones and mature seeds from which, for many years back, plants had been germinated and lined out in the excellent home nursery. Durris-reared plants of Douglas Fir had contributed largely to the many thriving plantations on Deeside and elsewhere. Those concerned in forestry were much indebted to Mr. Baird for the deep and practical interest always taken in sylviculture by him; and, while doing much in the experimental line to benefit the industry, he had even kept in view the cultivation of timber trees proved by experience, such as the Larch, never forgetting that:

The pine is King of Scottish woods,
But the Queen, ah! who is she?
The fairest form the forest kens,
The bonnie birken tree.

Warm thanks were accorded Mr. Michie for his admirable and delightful address. Mr. Ernest Lees, factor; Mr. Charles Stewart, forester; Mr. Andrew Reid, head gardener; and Mr. Alexander Finnie, Clerk of Works, all of Durris estate, acted as guides with great acceptance, and drew attention to the noted trees and plants with which Durris is so richly endowed. Tea was served under the presidency of Mrs. Baird, and, Lord and Lady Aberdeen having to leave earlier in the afternoon, Mr. James S. Davidson, Cairnlee, intimated apologies for absence, and referred to the enormous services Lord and Lady Aberdeen had rendered to the Club. That day was one of the Club's red-letter days, and they would never forget their visit to Durris and the kindly welcome awaiting them there.

NATIONAL ROSE.

SEPTEMBER 9 AND 10.—The show of the National Rose Society, which was held at the R.H.S. Hall, Vincent Square, Westminster, on these dates was the most successful of the autumn shows arranged by that Society. The Hall was well filled with Roses of far better quality than the difficulties of the season had led rosarians to expect. In most of the classes the competition was quite good and the two trade classes for representative groups of Roses brought many collections of great merit. New seedling Roses also were very numerous, but it must be admitted that the quality generally of the novelties was poor. One Gold Medal and five Certificates of Merit were awarded. The Clay Cup, which was offered for the best new scented seedling Rose—other than climbing or rambling—of the year, and has been open to competition at all the Society's shows, was awarded to Flamingo, shown by Messrs. ALEX. DICKSON AND SONS, which received a Gold Medal. The Cory Cup was not awarded.

GOLD MEDAL.

Desmond Johnston.—This Pernetiana variety had previously received a Certificate of Merit, and we imagine the higher honour was conferred on account of its exceptional colour, for it in no way approaches the ideal in form. Often the fully developed blooms are semi-double and cup-shaped, but their vivid, scarlet-carmine colour on a gold base is very fascinating. The rich colouring does not fade at maturity, but seems to become intensified with age. The outer surfaces of the broad petals are heavily flushed with yellow. Shown by Messrs. S. MCGREDY AND SON.

CERTIFICATES OF MERIT.

Felicia.—A very free-flowering hybrid Musk Rose of bushy habit which bears large clusters of semi-double blush flowers. Shown by Mr. J. H. PEMBERTON.

Lady Leslie.—A beautiful H.T. variety in its earlier stages but, when mature, the shining, rosy-scarlet colour fades to magenta on the outer petals. The flowers are pleasantly scented. Shown by Messrs. S. MCGREDY AND SON.

Marion Horton.—A small, free-flowering, fully double H.T. variety of considerable garden value. The plant is of dwarf habit and the flowers are a bright yellow. Shown by Messrs. BEES, LTD.

Perfume.—A very sweetly-scented, semi-double H.T. Rose of rich velvety crimson colour. The flowers, which are from four to five inches across, have substantial petals and a neat cluster of golden-yellow stamens. Shown by Mr. JOHN MARRIOTT.

Polly.—(See Fig. 102).—This is a long-stemmed H.T. variety of Madame Butterfly size and type, but of variable colouring. The colour generally is a pale salmon, paler at the margins, and with a deep yellow base. Shown by Messrs. G. BECKWITH AND SONS.

NURSERYMEN'S CLASSES.

The groups of Roses arranged in the competitive classes for nurserymen constituted by far the most important displays in the exhibition. They were arranged against the wall; the largest class was for a collection arranged on a space fifteen feet by four feet, and the height was restricted to eight feet at the back. No fewer than twelve entered in this class, in which Messrs. S. MCGREDY AND SON were placed first; Messrs. CHAPLIN BROS., second; Mr. J. H. PEMBERTON, third; and Mr. C. GREGORY, Chilwell, fourth. A very similar method of staging was adopted by all the exhibitors—blooms arranged on columns and in tall epernes interspersed with baskets and vases of Roses. Two conspicuous varieties in Messrs. McGredy's group were Betty Uprichard and Margaret McGredy, with a fine display of Mrs. A. R. Barraclough in the centre. Other choice sorts were Independence Day, Admiration, Shot Silk, Mrs. H. Stevens and Mabel Morse.

Messrs. CHAPLIN BROS. had some splendid pillars of Roses of such varieties as Los Angeles, Lady Inchiquin, Brilliance, Coral Cluster and Ophelia. Mr. PEMBERTON's exhibit was very bright, and in it we noticed excellent specimens of Vanity, Golden Emblem, Penelope and Mermaid.

For a smaller group occupying a space of eight feet by four feet, Messrs. R. HARKNESS AND CO. were awarded the first prize for a representative collection of varieties. In the middle was a splendid stand of K. of K., and other good sorts shown by this firm were Madame Butterfly, Los Angeles, Lady Inchiquin, Doris Traylor and Independence Day, the latter of fine colouring; Messrs. W. EASLEA AND SONS were a good second, their exhibit containing a pretty centre basket filled with blooms of Emma Wright, White Shot Silk, Golden Emblem, Lady Dixon, Hartland, Butterfly and Clarice Goodacre were also excellently well shown by this firm; third, Messrs. J. JEFFERIES AND SONS, Cirencester.

Only two competed in the class for twenty-four varieties, distinct, shown in vases or other receptacles, the exhibit to be arranged, so far

as possible, to display the foliage and habit of growth of each variety. The better of the two exhibits was shown by Messrs. A. WARNER AND SON, Boxted, Colchester; Mr. JOHN MATTOCK being awarded the second prize. Messrs. WARNER's blooms were arranged in vases hidden behind black velvet, and included fine flowers of Etoile d'Holland, Hortulanus Budde, Shot Silk, Mable Morse, Rev. Page Roberts, Else Poulsen and other popular sorts.

The best four baskets of Roses in four distinct varieties were shown by Messrs. D. PRIOR AND SON, LTD. Their varieties were Lady Inchiquin, Souvenir de Georges Pernet, Mrs. H. Bowles and Golden Emblem; second, Mr. H. DREW, with Souvenir de Georges Pernet, Betty Uprichard, Madame Butterfly and Mrs. H. Morse; third, Messrs. T. SMITH AND SONS.

A similar class was provided for three baskets of Polyantha Roses in three distinct varieties, in which Messrs. D. PRIOR AND SON excelled with Kirsten Poulsen, Else Poulsen and Greta Poulsen; second, Mr. E. B. LE GRICE, North Walsham, with Else Poulsen, Coral Cluster and Orange King; third, Messrs. W. CUTBUSH AND SON.

BLOOMS IN BOXES.

There were two classes in the nurserymen's section for specimen blooms shown in boxes, the one for twenty-four blooms, distinct, the other for eighteen blooms, distinct. In the larger class, Messrs. T. SMITH AND SONS, Stranraer, excelled, with very choice blooms, notable varieties being Dame Edith Helen, which was adjudged the best bloom in the show; Earl Haig, Janet, Capt. Kilbee Stuart, Mabel Morse and H. P. Pinkerton.

In the smaller class, Mr. J. MATTOCK and Mr. D. LONG were placed equal firsts, and Mr. HENRY DREW, second.

The best two baskets of cut Roses were shown by Messrs. T. SMITH AND SONS, who had fine blooms of Earl Haig and Augustus Hartmann.

ARTISTIC CLASSES.

As usual at these shows, the various exhibits of tables decorated with Roses, bowls of Roses, and vases of cut Roses occupied considerable space and added greatly to the attractions of the exhibition. In the nurserymen's section the finest decorated table was shown by Miss MURIEL ARCHER, who made a very pretty display with the variety Dainty Bess.

The Ladies' artistic classes sustained their great popularity, and there were many well arranged tables and vases of Roses. Mrs. COURTNEY PAGE, with an artistic arrangement of Roselandia and foliage, was first in the dinner table class, and Mrs. OAKLEY FISHER, using the same variety, was second. Mrs. A. D. RUFF, with fresh blooms of Madame Butterfly, was first in the class for a vase of Roses, while Mrs. COURTNEY PAGE was second. The best bowl of mixed Roses was arranged by Mrs. COURTNEY PAGE, and Mrs. OAKLEY FISHER was second.

AMATEURS' CLASSES.

The Decorative Roses in the amateurs' section were highly creditable. The best one basket of cut Roses, one or more varieties, was shown by Mr. H. MITCHELL, Bradford, while Mr. GEORGE MARRIOTT, Carlton, Notts., was second with K. of K. Showing a good basket of mixed varieties. Mr. E. T. THISTLETHWAITE, Barnet, was first in the class for growers residing within a radius of ten miles of Charing Cross, and Mr. A. N. ROGERS, Putney, was a good second.

Competition was very good in the class for members who grow their Roses unaided, and here Rev. F. R. BURNSIDE, Great Stourbridge, was first with a beautiful basket of Mrs. Henry Bowles, and Mr. W. E. MOORE, Ickenham, was second. In the class for growers of fewer than two-hundred-and-fifty plants of garden and decorative varieties and the same number of exhibition Roses, Mr. J. W. ROFF, Thorpe Bay, Essex, was first with a basket of especially

good mixed varieties, and Mr. E. E. TATTERSHALL, Orpington, was second.

The Roses shown in vases were also of good quality. Mr. S. W. BURGESS, Tonbridge, who had particularly fine blooms of Ophelia and Angèle Pernet, was first in the class for six distinct varieties, and Mr. GEORGE MARRIOTT was second. Mr. H. ROBINS, Margaretting, won chief honours in the chief class for members who grow their Roses unaided, and he had particularly meritorious blooms of Betty Uprichard, Independence Day and Los Angeles amongst his six varieties. In the class for smaller growers, Mr. E. E. TATTERSHALL won the first prize with six vases of good Roses.

The Exhibition Roses showed the same creditable standard of quality and, in most of the classes the competition was good. Mr. J. H. HART, Potters Bar, who included Margaret McGredy, White Maman Cochet and Augustus Hartmann, was first with twelve distinct varieties, and Dr. W. P. PANKRIDGE, Petersfield, was equally successful with six distinct varieties, of which his best were Candeur Lyonnaise, J. G. Glassford and Mrs. Henry Bowles. Mr. G. SPEIGHT, Market Harborough, was first with six varieties in the class for members who grow their Roses unaided and, in the similar class for smaller growers, Mr. E. H. PLEASANCE, Cambridge, was first with an uneven collection, but had very good specimens of Candeur Lyonnaise and Earl Haig. Mr. A. N. ROGERS, Putney, and Mr. D. RIBBONS, Dulwich, won the first prizes in the two metropolitan classes.

ROYAL HORTICULTURAL.

SEPTEMBER 13.—The meeting on Tuesday last included special competitive classes for vegetables, and these dominated the exhibition, there being very few Orchids, and only one or two floral groups. The quality of the vegetables was exceedingly good, and in most classes competition was very keen. In addition to the competitive vegetables there were two fine trade groups, the one a collection of vegetables, shown by Messrs. SUTTON AND SONS; the other a large exhibit of Potatoes staged by Messrs. DOBBIE AND CO.

Orchid Committee.

Present: Sir Jeremiah Colman, Bart., Mr. Gurney Wilson, Mr. H. G. Alexander and Mr. J. E. Shill.

Owing to the sale of the late Mr. H. T. Pitt's collection, there was a poor show of Orchids, and there was not a quorum of the Committee present.

AWARD OF MERIT.

Cattleya Horos (*C. Heliodor* × *C. Sunbeam*).—The Committee recommended the Council to grant the award. This beautiful *Cattleya* has a medium-sized flower of rich golden-orange colour; the labellum is prettily veined and bordered with cerise. Shown by Baron BRUNO SCHRÖDER, Englefield Green, Surrey (gr. Mr. J. E. Shill).

GROUP.

The only group was staged by Messrs. SANDERS, who had distinct varieties of *Cattleya Hardyana*, the singular *Angraecum Eichlerianum*, several well-flowered examples of *Odontoglossum grande*, *Catasetum viridiflorum*, *Paphinia cristata* and *Cattleya Bridal Veil*, an attractive, pure white flower.

Messrs. J. AND A. McBEAN, Cooksbridge, Sussex, showed *Odontioda Cooksoniae* var. Vivid, with a spike of twenty-two scarlet-red flowers, *Laelio-Cattleya Profusion*, and *Cattleya Aeneas*, golden, with ruby-crimson lip.

Messrs. SUTTON BROS., Hassocks, exhibited *Laelio-Cattleya Soulangue* var. Woodside, a large, well-coloured flower.

Floral Committee.

Present: Section A.—Mr. H. B. May (in the chair), Mr. J. F. McLeod, Mrs. Ethel M. Wightman, Mr. H. J. Jones, Mr. R. Findlay, Mr. J. M.

Bridgford, Mr. W. Howe, Mr. D. Allan, Mr. Hugh Dickson, Mr. M. C. Allwood, Mr. A. E. Vasey, Mr. J. B. Riding, Mr. D. B. Crane, Mrs. Lindsay Smith, Mr. G. W. Leak, Lady Beatrix Stanley and Mr. W. D. Cartwright (Secretary).

Section B.—Mr. G. Loder (in the chair), Mr. C. T. Musgrave, Mr. G. Yeld, Sir William Lawrence, Mr. A. Bedford, Mr. E. H. Wilding, Mr. T. Hay, Mr. F. G. Preston, Mr. L. R. Russell, Mr. W. B. Cranfield, Mr. J. James Hudson, and Mr. N. K. Gould (Secretary).

AWARDS OF MERIT.

Chrysanthemum Mayford Bronze.—A decorative variety of golden-bronze colour, suitable for garden decoration and as cut blooms; this variety is a promising sort for market growers. Shown by Mr. H. SHOESMITH, Junior, Mayford, Woking.

Chrysanthemum Pearla.—A small Japanese variety of the decorative type with medium-sized blooms of a pale flesh-pink colour. The blooms are borne on very strong, stiff stems. Shown by Messrs. CRAGG, HARRISON AND CRAGG.

Scabiosa caucasica Goldingensis.—This is a very fine type of *Scabiosa caucasica*, with flowers of silvery-lavender colour; the plant is very vigorous in the stem and habit generally. Shown by Mr. J. GOLDING, Fordham, Cambridge-shire.

CULTURAL COMMENDATION.

Major FETHERSTONHAUGH, Royal Lodge, Windsor (gr. Mr. J. Green), was awarded a Cultural Commendation for massive heads of *Hydrangea paniculata*, some of the inflorescences measuring fifteen inches long and nearly as much through at the base.

GROUPS.

Messrs. L. R. RUSSELL, LTD., showed a group of climbing plants, including numerous varieties of Clematis in flower, Vitis Henryi, Polygonum Baldschuanicum, Ivis and Plumbago capensis, attractively arranged with Eulalia zebrina, Ophiopogon Jaburan variegata, Nandina domestica and other pretty foliage plants.

Messrs. C. ENGELMANN, LTD., showed varieties of China Asters of the Californian Giant type, in white, deep rose-pink, lavender and other shades.

The JOHN INNES HORTICULTURAL INSTITUTE showed a collection of bi-coloured, tri-coloured and variegated Pelargoniums, including many old favourite varieties of these plants, such as Flower of Spring, Brilliantissima, Golden Christine, Mrs. Pollock, Black Vesuvius and West Brighton Gem.

Mr. F. G. WOOD showed a collection of alpine plants arranged in rock work, with small Conifers at the back. Adjoining the alpine were hardy border flowers in variety. Messrs. BARR AND SONS showed their fine Michaelmas Daisy Barr's Pink, which received an Award of Merit on October 3, 1922. Messrs. M. PRICHARD AND SONS exhibited a group of hardy flowers, and Messrs. LOWE AND GIBSON showed Delphiniums and Gladioli. The Misses K. AND E. HOPKINS had a small rockery planted with alpine. A new Violet named Princess Mary was exhibited by Mr. J. J. KETTLE. Mr. H. HEMSLEY again showed his beautiful new Sidalceas.

Messrs. I. HOUSE AND SON exhibited Scabious, including S. anthemifolia rosea, also some exceptionally fine spikes of Kniphofias, and a new border pink named White Ladies.

Carnations were exhibited by Messrs. ALLWOOD BROS., and Messrs. C. ENGELMANN, LTD.

Messrs. R. H. BATH, LTD., showed a big group of Gladioli and the rich scarlet Nerine Fothergillii major. Messrs. J. CHEAL AND SONS showed varieties of garden Pentstemons representing a fine strain of this useful garden flower.

Gladioli were extensively shown by Messrs. KELWAY AND SON, and they had in addition

fine spikes of Delphinium Mrs. James Kelway, Monarch of All, Mrs. H. J. Jones, Smoke of War, and other well-known varieties.

A very imposing exhibit of Roses was staged by Mr. J. H. PEMBERTON; it included such sorts as Los Angeles, Betty Uprichard, Vanity, Pax, Moonlight and Prosperity.

Brunsdonna Parkeri, shown by A. WORSLEY, Esq., Mandeville House, Isleworth, is apparently the same plant as Amaryllis Parkeri. It had a very imposing inflorescence of some twelve or so flowers of a rosy-pink colouring, fading to white in the interior, with a distinct orange base. The exterior of the tube has very distinct lines of rose suffused with apricot; the chocolate-coloured peduncles are very distinct.

Fruit and Vegetable Committee.

Present: Mr. C. G. A. Nix (Chairman), Mr. A. H. Pearson, Mr. P. C. M. Veitch, Mr. G. F. Tinley, Mr. F. Jordan, Mr. W. Poupart, Mr. E. A. Bunyard, Mr. H. Prince, Mr. E. Neal, Mr. Joseph Cheal, Mr. W. H. Divers and Mr. A. N. Rawes (Secretary).

GROUPS.

Messrs. SUTTON AND SONS put up a most imposing collection of vegetables, comprising 240 dishes of distinct kinds, this being one of the largest collections of vegetables the firm has ever shown. It was beautifully arranged and the variously coloured subjects were cleverly disposed to produce colour effect; indeed, the collection was as attractive as one of beautiful flowers. Along the back, against a ground of black velvet, were arranged Cauliflowers, Celeries, Leeks, Capsicums, Onions, Beetroots, Kohl Rabi and other kinds of vegetables, whilst on a raised platform covered with black velvet were disposed mounds, baskets and groups of almost every kind of vegetable the garden affords, both in and out of season. The Capsicums were a special feature, some scarlet, others golden and bright yellow. Notable dishes were New Red Intermediate Carrots and Matchless Scarlet Carrots, Ailsa Craig Onions, King Edward VII Potatos; Aubergines Long Purple and New York; Peas, Late Queen, Peerless and Gladstone; Cucumbers in variety, and there were also Parsnips, Marrows, Tomatos, Celeriac, Chinese Rose Radish, Lettuces, Cabbages and numerous others.

Messrs. DOBBIE AND CO. showed a collection of Potatos of outstanding merit, this being one of the largest exhibits in the hall. All the tubers were clean, shapely specimens of their varieties, which included Golden Wonder, Catriona, Witch Hill, Great Scot, The Bishop, Red King, The Ally, King Edward VII, Arran Comrade, Kerr's Pink, and most other sorts in cultivation. The difference in some of the varieties grown in ordinary soil and on the Dunbar red soil was most pronounced, in the one case the skin being white and in the other brown.

A group of hardy fruits was shown by Mr. H. HEMSLEY, including excellent Apples of such varieties as Gloria Mundi, Worcester Pearmain, Hoary Morning, Lady Sudeley, Warner's King, Stirling Castle, Madresfield Court and Cox's Orange Pippin; also Plums, Bullaces and Crabs.

Competitive Vegetable Classes.

Five competed in the largest class for a collection on a tabling space measuring six feet by four-and-a-half feet. All the exhibits were worthy of the occasion, but, unfortunately, one was disqualified as having thirteen Potatos in a dish instead of twelve. The first prize was awarded to the Rt. Hon. VISCOUNT HAMBLETON (gr. Mr. W. Turnham), Greenlands, Henley-on-Thames, who had exceptionally fine Giant White Celery, big Tender and True Parsnips, splendid Onions of the Ailsa Craig type, New Red Intermediate Carrots; All-the-Year-Round Broccoli, Exhibition Leeks, Potatos, Cucumbers, Beans, Beets, Peas and Tomatos; second, Sir RANDOLF BAKER, Bt. (gr. Mr. A. E. Usher), Ranston, Blandford, whose New Red Intermediate Carrots were exceptionally good. He also had good Student Parsnips, solid White Celery, and Autumn Mammoth Cauliflowers; third, CHEADLE ROYAL MENTAL HOSPITAL (gr. Mr. A. Falconer).

For a smaller collection, arranged on four-and-a-half feet frontage tabling, there were six competitors, and much the best collection was shown by the Rt. Hon. LORD RIDDELL (gr. Mr. A. Payne), Walton Heath Golf Club, Tadworth; Exhibition Celery, Autumn Giant Cauliflowers, Ailsa Craig Onions and The Bishop Potatos were his best dishes; second, R. CHETWYND-STAPYLTON, Esq. (gr. Mr. W. Meager), Berkhamsted, whose Superb Pink Celery was exceptionally good; third, Rev. RONALD SMITH (gr. Mr. H. Bates), Hertingfordbury.

A very nice exhibit shown by R. H. LING, Esq. (gr. Mr. D. W. Bedford), Berkhamsted, won the first prize in the class for a collection arranged on a table with three feet frontage. Potatos King Edward VII and Ailsa Craig Onions were his best dishes; second, R. CHETWYND-STAPYLTON, Esq.; third, Rev. T. G. WYATT (gr. Mr. J. E. Shirley), Horley.

A class similar to the last was open only to amateurs who employ no whole-time gardener, and to those who employ a single-handed gardener only. Here the first prize was awarded Mr. F. BARRETT, Eltham, with a very excellent exhibit of Prize Pink Celery, Autumn Queen Cauliflower, Premier Onions, Intermediate Carrots, Arran Comrade Potato and Champion Prize Leeks; second, Mr. J. DAY, Berkhamsted.

POTATOS.—The exhibits in the Potato classes were exceptionally numerous and occupied the whole of the tabling from one end of the hall to the other; superb produce was shown in both classes, the largest of which was for a collection of twelve distinct varieties, in which H. W. HENDERSON, Esq. (gr. Mr. F. L. Pike), Newbury, excelled. He had excellent tubers of The Bishop, Catriona, Majestic, Ben Lomond, Red King, Snowdrop, Tinwald Perfection, Up-to-Date, Factor, Arran Consul, Crusader and King Edward VII; second, H. J. JONES, Esq., Histon; third, Sir CHARLES NALL-CAIN (gr. Mr. T. Pateman).

In the smaller class for six distinct varieties, VISCOUNT HAMBLETON gained the first prize with The Bishop, Arran Rose, Witch Hill, Di-Vernon, Arran Comrade and Catriona; second, H. W. HENDERSON, Esq.; third, Sir RANDOLF BAKER.

ONIONS.—The best collection of six distinct varieties of Onions was shown by VISCOUNT HAMBLETON, whose biggest bulbs were of the varieties Ailsa Craig and Cranston's Excelsior. The other sorts were Improved Reading, Silver Globe, Sutton's Globe and Crimson Globe; second, Sir RANDOLF BAKER, whose bulbs of Ailsa Craig were very fine.

The best collection of salads in six distinct kinds were shown by Sir JOSEPH TICHBORNE, Bt. (gr. Mr. C. Goodchild), Tichborne Park, Alresford; second, VISCOUNT HAMBLETON.

SINGLE DISH CLASSES.

Twenty-nine classes were provided in this section, and competition in most of them was very good, there being over fifty entries in each of the Potato classes alone.

Mr. J. T. HILL, of Westbury, Wiltshire, obtained the first prize for Scarlet Runner Beans with the variety Prizewinner; no fewer than forty-four competed in this class. Only three competed in the class for French Climbing Beans, the first prize being awarded to Sir RANDOLF BAKER for a dish of Princess of Wales. The first prize in the class for French Dwarf Beans was won by Sir CHARLES NALL-CAIN (gr. Mr. T. Pateman), with the variety The Prince. The best dish of Globe Beets was the one shown by H. W. HENDERSON, Esq., of the variety Crimson Ball, and the best long Beet was exhibited by LORD RIDDELL who showed Black. Mr. R. H. LING had the best Brussels Sprouts, in fine sprouts of Exhibition, and Sir RANDOLF BAKER the best Cabbages, with fine heads of Flower of Spring. The CHEADLE ROYAL MENTAL HOSPITAL was placed first for Cauliflowers, showing remarkably fine heads of All-the-Year-Round, while Sir RANDOLF BAKER won the premier award for Celeriac.

Celery was well shown, and the first prize

for a white sort was awarded to VISCOUNT HAMBLEDEN, with the variety Giant White; the best red Celery came from LORD RIDDELL's gardens; the variety was Exhibition. Sir JOSEPH TICHBORNE was placed first for Cucumbers with the variety Delicacy. Leeks Prize taker, shown by Sir RANDOLF BAKER, were adjudged the best in this class, and the first prize for Marrows went to the CHEADLE ROYAL MENTAL HOSPITAL, who staged the variety Long White. The first prize for Onions sown in the open in the autumn of 1926, was awarded to G. F. IVE, Esq., Hook Road, Surbiton, who showed Autumn Queen. For Onions sown in the open in 1927, Mr. W. DEBENHAM, Westcombe Cottage, Hayes, Middlesex, secured the premier award with Ailsa Craig. Competition was keen in the class for Onions sown under glass, in which VISCOUNT HAMBLEDEN was placed first with Ailsa Craig. Sir JOSEPH TICHBORNE gained the premier award for Parsnips with the variety Tender and True, while Sir RANDOLF BAKER gained first place for Long or Intermediate Carrots with the variety New Red Intermediate. The best dish of stump-rooted or short Carrots was shown by W. N. TYZACK, Esq., High Wycombe, who staged the variety Favourite. The CHEADLE ROYAL MENTAL HOSPITAL had the best Peas, whilst the finest dish of white-fleshed Turnips came from J. MAUNDERS, Esq., The Poplars, Oxted. The best dish of yellow-fleshed Turnips, Orange Jelly, was shown by the CHEADLE ROYAL MENTAL HOSPITAL. Red Tomatos were well shown by Sir JOSEPH TICHBORNE, who excelled with the variety Best-of-All, while the first prize for a dish of yellow Tomatos went to Mrs. AUSTIN, Totteridge, for Golden Sunrise.

The first prize for Round Potatos was won by VISCOUNT HAMBLEDEN, who had specimens of Arran Comrade; Mr. H. J. JONES, Rustington, Histon, won the premier award for kidney-shaped Potatos, with a splendid dish of Witch Hill.

In the class for any other vegetable, Sir JOSEPH TICHBORNE gained first prize with Aubergine Goodchild's Selected.

Obituary.

William Clark.—On Wednesday, September 7, amid every manifestation of respect and esteem, the remains of the late Mr. William Clark, gardener, were laid to rest in the beautiful Allenvale Cemetery, Aberdeen. Mr. Clark was one of the best known residents in the Bridge of Dee district, and his unassuming and kindly disposition endeared him to all his friends. His entire life was spent in the locality where for over half-a-century he served with two employers—Mr. Smith of Kainhill, and Mr. Scott, Garthdee Gardens and Braeside Market Gardens, Mannofield, Aberdeen. Two years ago, Mr. Clark was awarded the Highland and Agricultural Society's medal for thirty-seven-and-a-half years' continuous service with one employer.

Charles S. Fuidge.—It is with deep regret we learn of the death of Mr. C. S. Fuidge, who was for more than fifty years Secretary of the Southampton Royal Horticultural Society—a period which is probably a record. He died on the 1st inst., in his eighty-eighth year. Mr. Fuidge was connected with the Ordnance Survey in a professional capacity, but his great hobby was horticulture. He was elected a member of the Southampton Committee so long ago as 1867, and in the same year he won a Silver Medal, offered for the most meritorious exhibit at the Society's show. Many of our older readers will remember how successful the Southampton shows were, and how much they owed their success to Mr. Fuidge, for he was an ideal Secretary. Some idea of the importance of the Southampton shows at one time may be judged by the attendance in 1886, when 25,000 visitors were present. The shows were held at Westwood Park and also on the local pier. Unfortunately, like most societies, the Southampton Society experienced a period of difficulty during the war period, but Mr. Fuidge continued his secretarial work in spite of all difficulties.

ANSWERS TO CORRESPONDENTS.

BAY LEAVES FAILING.—D. C. There was no disease present on the Bay leaves submitted, but there were signs of scorch, due, perhaps, to syringing the plant in bright sunlight. "Frass" was present on some of the leaves so that caterpillars should be sought for; there are several species of moths which feed on this plant. Numerous scale insects were also present on the leaves, and it will be advisable to sponge the foliage in late autumn with paraffin emulsion.

BOOK ON WREATH AND BOUQUET MAKING. A. R. So far as we are aware, there is no book in print dealing with the making of wreaths and bouquets.

CATERPILLARS ON BIRD CHERRY.—W. L. The moth is one of the Small Ermine group (*Hyponomeuta*), but not in good enough condition to determine which of the six species. Five of them live as caterpillars on Bird Cherry, *Euonymus*, Sloe and other trees and shrubs, and they make a common web or nest amongst the leaves and branches. In this web, or in the vicinity of the plant in which they have fed, they spin their little shuttle-shaped cocoons, each about the size of an Oat, and the moths come out in July and August. The sixth species lives on *Sedum Telephium* (the wild Orpine) and is local, as are two of the others; the remaining three are common. These moths are not members of the Tortrix group, but are Tineids, allied to the clothes moths. Starlings are said to feed greedily on the larvae, but spraying forcibly with paraffin emulsion, or even clear water, will kill numbers of the caterpillars. All webs within reach should be cut off so soon as they begin to form.

DAFFODIL AWARDS AT WISLEY.—Correction. In our report of the R.H.S. awards to Daffodils at Wisley, published on page 179, a printer's error occurred. The varieties marked with an asterisk received awards as plants suitable for the garden, and not for the rock garden, as stated, with the exception of Beryl, sent by Mr. P. D. Williams, which was the only Daffodil to receive the award as a variety suitable for the rock garden.

DAISIES ON A TENNIS LAWN.—Unit. Whiting, used for marking out tennis courts, is simply chalk or carbonate of lime ground very finely. It favours the growth of Daisies simply by the chemical action of the lime releasing other plant foods. It also enables grass to grow in the same way, and on some lawns where whiting has been used for some time in marking them, the grass is distinctly greener along the marked lines. This would be the case where the ground required liming. The presence of the Daisies in this case was probably due to the grass along the service lines being rather worn, and the Daisies, probably arising from seeds, have got the upper hand. The broad leaves lie flat on the ground and prevent seedling grasses, and the side-shoots of existing ones, from growing for want of light. *Prunella vulgaris* (Self-heal) often behaves in the same way on closely-mown lawns. Daisies are amongst the easiest of weeds to kill with lawn sand, if the latter is applied on a dry day, or when there is a prospect of two dry days. When dissolved by rain, lawn sand becomes a fertiliser; but it is desirable to get the Daisies killed first. If the dew is off the grass, so much the better. The bare parts can then be scratched with a rake, grass seed sown, thinly covered with sifted soil, and then rolled. If the lawn is not overworked by playing during the autumn, the grass should be well established before next spring. If you object to Clover on the lawn, do not use basic slag, whatever other artificial manures you may apply. When using lime for killing mossy growth, it would be good policy to lime the whole lawn, whether moss is present all over or not, to rectify acidity, which is favourable

to the growth of moss. Leaf-soil and bonfire ash are richer in plant food than ashes from paper.

DESTRUCTION BY JAYS AND RABBITS.—B. B. As you do not wish to kill the marauders, we fear you will find it a difficult matter to prevent them injuring your plants. To deter jays we have found it fairly effective to shoot a couple and hang them near the site of the damage. If the dead birds are suspended sufficiently high for the other birds to see before they try to alight they will, in our experience, rarely settle. If this should prove ineffective in your case and the Pyrethrums are the only plants attacked, we suggest that the bed be covered over with wire-netting. The Pyrethrums will grow through the netting, which will prevent the jays pecking out the crowns of the plants. As the garden is wired-in and rabbits are troublesome it would seem that the wiring is not efficiently done. To be effective against rabbits wire-netting must be at least three feet six inches deep, of not larger than three-quarters-inch mesh, and six inches of the netting should be sunk into the ground at a tangent. The placing of scares is no use against rabbits, which do most damage in the garden after dark. A ring of gas-tar around the Chrysanthemum beds would most likely keep the rabbits away.

DELPHINIUM LEAVES DISEASED.—E. N. W. Your Delphiniums are suffering from the Black Blotch disease caused by *Bacterium Delphinii*. It is described in detail in the *Journal of Agricultural Research*, Vol. XXVIII, 1914, page 261. The disease is now quite common in this country, and in certain districts it is causing a great deal of damage. Collect and burn all diseased leaves and stems and spray unaffected plants with weak Bordeaux mixture or a solution of sulphide of potassium to prevent the disease from spreading.

FOLIAGE OF CHERRY AND APPLE TREES UNHEALTHY.—F. W. S. The wood is smothered with eggs of red spider, and this pest is responsible for the bad colour of the foliage. Spray the trees with either liver of sulphur or dissolved paraffin jelly. Your best plan, however, would be to buy a ready-made specific for the destruction of red spider from the horticultural sundriesmen.

NAMES OF PLANTS.—R. L. B. 1, *Helianthus multiflorus* plenus; 2, *Helenium pumilum*; 3, *H. cupreum*.—A. S. *Abelia triflora* (small-flowered shrub); *Hibiscus syriacus*.—G. D. *Echinacea purpurea*.—Altho. *Pyrus baccata*, the Siberian Crab, the fruits may be used for making jelly.—T. H. *Cestrum fasciculatum*.—A. R. *Sedum stoloniferum*.—A. O. 1, *Codiaeum* (Croton) *undulatum*; 2, and 11, C. Count Hugo; 3, C. Mars; 4 and 30, Madame de Boudney; 5, C. Souvenir de Thomas Rochford; 6, C. Prince of Wales; 7, C. Reidii; 8, C. Madame Mayne; 9, C. edmontonense; 10, C. Eugene Draps; 12, C. Bobs; 13, C. Secretaire Chevalier; 14, C. Elvira; 15, C. Countess superba; 16 and 17, C. aneitumense; 18, C. Lucy; 19, C. Countess; 20, C. Van Oosterzeel; 21 and 27, not recognised; 22, C. Her Majesty; 23, C. Fred Sander; 24, C. Lady Zetland; 25, C. Golden Ring; 26, C. Warrenii; 28, C. Baron Frank Seilliere; 29, C. Icarus.

OLEANDERS.—C. F. R. The propagation of Oleanders (*Nerium Oleander*) presents no difficulties. The best cuttings are those of well-ripened leading shoots, and if these are inserted singly in small pots, in sandy soil, they will root readily if kept in a close, warm frame. When rooted, place the plants in a cool greenhouse, remembering that the Oleander is almost hardy. Provide larger pots in due course, and start the plants out-of-doors in a sunny position during the summer months.

SUPPLEMENTARY PLATE.

Water Garden at Glasnevin.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 54.5°.

ACTUAL TEMPERATURE—

The Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, September 21, 10 a.m. Bar. 29.8. Temp. 64°. Weather, Dull.

Dahlias. MANY years have passed since Dahlias were so popular as now, and never before have these handsome, easily-grown and decorative plants been so largely cultivated for garden decoration. Dahlia growers of long experience will remember the time when these flowers were immensely popular at exhibitions, but regarded as of little value for garden display. Those were the days when the fine old Fancy and Show varieties were grown with the utmost care and the big circular blooms, dressed by patient enthusiasts, were arranged in regular lines on show boards at the Crystal Palace and elsewhere. But at the recent splendid exhibition held by the National Dahlia Society these varieties, so beloved by old florists, were almost conspicuous by their absence, and the larger part of the display was provided by flowers of varieties which, for the most part, were produced on plants that have a distinct garden value. True, some of the Cactus varieties still hide their beautiful

blooms among the foliage, but the time has long passed when Cactus varieties were regarded as fit only for exhibition purposes. Varieties of this section suitable for garden decoration are now available in plenty, nevertheless, varieties of other sections have become even more popular for brightening the garden in late summer and autumn—as witness the brilliant display of Coltness Gem and H. J. Jones in public parks in all parts of the country. The big Decorative varieties, such as Jersey Beauty, carry their flowers on long stems and attract a large amount of attention, and now that Paeony-flowered varieties hold up their heads, they, too, have become popular as garden plants. Charm, Star, Miniature-Paeony, Decorative and other sections add a diversity of form that was lacking half-a-century ago, and in each section there are flowers of rich as well as soft shades of colour. In these matters the gardener of to-day is better served than his forefathers, and yet, although older florists are somewhat scornful, the Dahlia enjoys a greater popularity for exhibition purposes than it ever did before. A few years ago the idea of growing Dahlias in pots for sale in Covent Garden Market would have been scouted and the man who put it forward would have been regarded as mentally deficient. But as genius is akin to madness, so this "mad" idea has developed into a paying business. From May onwards flowering plants, in pots, of the scarlet Coltness Gem and the yellow H. J. Jones, have been offered for sale regularly in Covent Garden Market—even to the present week—and what is more to the purpose, they have sold, and still sell, well. Young plants, not yet in flower, were also offered for sale in large numbers in the late spring, and such plants were finer than those usually sold by specialists; the varieties so offered were, of course, limited in number. Nor may the value of Dahlia flowers for house decoration be overlooked, notwithstanding the fact that as market flowers they do not meet with general approval—with one exception, and that is the pink variety Pride of Berlin, slightly larger, perhaps, but very like the old Pompon variety Nerissa. On the continent the Dahlia has been a recognised market flower for several years, and visitors to the quaint and busy little town of Aalsmeer, in Holland, would be greatly surprised to see the large quantities of Pompon and small Decorative varieties offered for sale in its markets. Both as a garden plant and as a cut flower the Dahlia is extremely popular in many continental countries, notably in Holland—where numerous Dahlia shows are held and almost every shop window has its vase of Dahlias at this season of the year—Belgium and Germany. In the United States also the Dahlia is becoming increasingly popular. In short, the Dahlia is enjoying a "boom" that it has never previously enjoyed, and grateful thanks are due to those patient raisers whose skill has made such a boom possible.

Water Garden at Glasnevin.—One of the largest collections of plants in Great Britain and Ireland is to be found at the far-famed Glasnevin Botanic Gardens, Dublin, and probably no one did more to make this collection a great one than Sir Frederick Moore, for so many years the Director of the gardens and now living at Rathfarnham, where, with Lady Moore, he finds great delight in a beautiful garden of interesting plants. Glasnevin is now under the care of Mr. Besant, who has a wide knowledge of and a great love for plants, as is shown by the skill with which everything is grown, notwithstanding many difficulties. The long walls at Glasnevin accommodate an amazingly fine collection of climbing plants, and invariably

attract the attention of visitors. The rock garden is also fine, but in the late summer and early autumn the water garden is one of the most attractive features. It is—as all good water gardens should be—a combination of water gardening and bog gardening, where masses of Astilbes, Senecios, many varieties of Nymphaeas, Reeds, Kniphofias and other plants find a pleasant home and provide rich colour and grace. The garden is on natural lines and the charming informality that prevails is as pleasing as are the well-grown and well-arranged plants that, with the water, make up the scene depicted in the Supplementary Illustration that accompanies the present issue.

Holland Hall Show.—The Royal Horticultural Society's great Autumn Show will be held at Holland Park Hall, Holland Park Avenue, W., on Wednesday, Thursday and Friday, September 28, 29 and 30. On the first day, Wednesday, September 28, there will be a private view for Fellows and their friends from 9 a.m. to 12 noon. Only Fellows' and Associates' tickets will admit to the private view, but transferable as well as non-transferable tickets may be used. There will be no admission by payment on Wednesday, September 28, until 12 noon, when the exhibition will be opened to the public.

Dahlias in the Swansea Parks.—Although Dahlias are a fine feature in several of the public parks at Swansea, it is at Cwmdonkin Park that the boldest display occurs; indeed, it has been stated that this is the best display of its kind ever seen in South Wales. About two hundred varieties are cultivated, and one long border contains no fewer than six hundred plants, each variety suitably labelled. In large, adjacent beds several species are cultivated, and these, together with old and modern varieties of different sections show the progress that has been made in the development of Dahlias for garden decoration.

Captain Kingdon Ward's Tenth Expedition in Asia.—A month or so hence, Captain F. Kingdon Ward will start upon his tenth plant-collecting expedition in Asia, accompanied by Mr. Hugh Clutterbuck. Captain Kingdon Ward proposes to visit Assam—the Naga Hills—as a preliminary to exploring country that is little known so far as plant-collecting is concerned. As in the case of previous expeditions, Captain Kingdon Ward will relate the story of his travels and discoveries in *The Gardeners' Chronicle*.

Assistant Superintendent of Glasgow Parks.—The Glasgow Parks Committee, at a meeting held on Friday, unanimously agreed to appoint Mr. James W. Atkinson, Chief Assistant of the Parks Department at Blackpool, as Assistant Director of City Parks, subject to the approval of the Town Council. Mr. Atkinson was chosen from a short list of six candidates and is to enter upon his duties on November 1.

"Gartenschonheit" for September.—The September issue of our Berlin contemporary, *Gartenschonheit* contains two very pretty coloured illustrations of Dahlias—a Star variety—Mauve Star, and a duplex sort named Elfenprinz, also mauve, but of a rather paler shade. Two other coloured plates represent a bouquet of Zinnias of mixed colours, and another of variously-hued Helichrysums, with us commonly called "Everlastings," but in German rather more appropriately termed "Strohblumen," or "Straw-flowers." The issue also contains a monochrome supplement plate of a vase of mixed Asters (Michaelmas Daisies) effectively arranged. An interesting article by Alexander Steffen describes a visit the writer recently paid to England, where he visited Kew, Wisley, Covent Garden Market and many other places of horticultural interest.

Scotch Potato Crops.—According to the reports received by the Board of Agriculture for Scotland, the Potato crops are in a fairly favourable condition, although not so good as they were a month ago. In most of the important Potato growing districts the haulms are showing marked signs of blight, and in some varieties the disease is said to be spreading rapidly. In a number of the northern and western

districts, however, the tubers are strong and healthy, and there is every prospect of a satisfactory crop. Yields ranging from five to ten per cent. below the normal are expected in south-west Aberdeen, south-west Forfar, north and east Perth, central Perth, north-east Fife, Berwick, Roxburgh, Selkirk, Ross, Dumbarton, Stirling and north Ayr, but in north-east Aberdeen, central Argyll, Kintyre and Bute the crop has a very promising appearance, and in these districts it is estimated that the yield will be about ten per cent. above the average. The area under Potatoes this year is 146,000 acres, or 4,000 acres more than in 1926. At the first of the season's sales of maincrop growing Potatoes, the average price worked out at £34 per acre, an advance on last year's average of £6 10s. 10d. Arran Consul sold from £45 to £52 per acre.

Gardeners' Festival in France.—An interesting ceremony took place at Le Petit Appeville, Normandy, on Monday, September 5, when the annual Gardeners' Festival, celebrated in France in the early autumn, was held in the small local church. The church was decorated with flowers and vegetables, and was filled to overflowing with members of the Confrérie de St. Fiacre (the patron saint of the gardening profession). In the porch was an elaborately arranged stand of loaves of fancy bread interspersed with Asters, Dahlias and other flowers; after the service, which included a sermon exhorting those present to excel in their profession, the bread was taken from the stand and distributed to the members of the congregation.

Aldenhams House Gardens.—On Saturday, October 1, by the kind permission of the Hon. Vicary Gibbs, Aldenhams House Gardens, Elstree, will be open to the public on behalf of the National Council of Girls' Clubs, an organisation which affiliates National Societies and Federations of Girls' Clubs in an effort to promote the whole Club Movement and avoid overlapping. As our readers are well aware, Aldenhams contains one of the largest tree and shrub collections in the world; in addition, the special feature on October 1 will be the collection of nearly two hundred varieties of Michaelmas Daisies. A small charge of 1s. will be made for admission.

Gift of Challenge Cups.—Mr. Edwin Barnes, Chairman of the Derbyshire County Council, has generously presented to the Midland Agricultural College a twenty-guinea Silver Challenge Cup, to be awarded to the best horticultural student each year, and the Rector of Sutton St. Michael's has kindly presented a Cup of similar value for the best short course agricultural student, as a thank offering for recovery from his long and serious illness. The College now possesses five twenty-guinea Challenge Cups for five groups of students.

The Brussels Botanic Garden.—The Botanic Garden at Brussels is one of the younger institutions of its kind, having been founded only in 1870. By a Royal Decree of the 30th June, 1921, the objects of the garden are defined, the first article of the Decree laying it down that its object is to furnish a scientific basis to the study of botany, and, with a view to carrying out this function, to collect both living and preserved plants of Belgium and the Belgian Congo in as complete a manner as possible. The functions of the Garden are classified under four heads: herbaria, museums, library and cultivation.

Seaweed as Food.—Mr. H. A. Hyde, Keeper of the Department of Botany, National Museum of Wales, Cardiff, writes: "The remark in your current number that 'in Europe only the inhabitants of Scandinavia use the Algae as food' appears to stand in need of a slight modification. In South Wales, red Seaweeds belonging to the genus *Porphyra* are collected and boiled down to make 'Laver Bread.' This substance is eaten as a condiment with fried bacon, and is to be seen regularly on sale in Cardiff market." We are obliged to Mr. Hyde for this "modification."

The late Alfred E. Prince.—Mr. Albert Upstone, Rotherham, writes, "It was with great

regret that I read in your issue of last week (September 10) of the passing of Alfred Prince. We were school-mates together at Oxford, and it was with his father, the late George Prince, of seedling Briar fame, that I was placed to start my horticultural career. Alfred Prince's nature was kindly and indulgent; he was always intensely devoted to his business, and rather shrank from personal notice, preferring always to strive for the increasing success of his business rather than to be himself in the limelight. That his efforts were crowned with well-merited success is a fact with which all are cognisant."

Mr. Thomas Hopkins.—Within nine years the Swansea Public Parks Department has supplied Blackpool, Salford and Bath with Park Superintendents. The latest of these appointments is at Bath, where Mr. Thomas Hopkins will soon take up his new duties. He was appointed on the 5th inst. Mr. Hopkins has occupied various positions and was employed for several years in the gardens at Llandough Castle, Cowbridge, Glamorganshire, under the late Mr. German. Later, he became foreman

MR. T. HOPKINS.

in Sir Oswald Moseley's garden at Rolleston Hall, Burton-on-Trent. During the war he was with the army in France and also in Palestine, and subsequently obtained an appointment in the Swansea Parks. His skill as a cultivator and organiser fitted him for important duties and in 1914 he was appointed assistant superintendent under Mr. D. Bliss. He was selected from seventy applicants for the superintendency of the Bath Public Parks and Gardens.

Rock and Water Gardens at Southport.—Many of our readers who visited the great exhibition at Southport in August last will be interested to learn that the rock and water gardens in competition for the Southport Challenge Trophy were judged on a system of pointing. The highest possible points obtainable were (a) the design, proportion and shape, 8 points; (b) simplicity, direction, continuity of the main lines produced by the ridges of stone (the placing of rocks and plants to convey an illusion of distance is included in this, also the design connected with any display of water), 20 points; (c) the setting of the stones (picturesque laying consistent with nature and general quiet effect), 14 points; it was insisted that great attention should be given to the placing of isolated stones, as this affects both "design" and setting; (d) the proportion of each colour used in planting the rockeries, 10 points; (e) the colours chosen in planting and their relative placing in harmony with one another, 18 points; (f) skill in regard to grass laying,

careful planting, and hiding cement, background, etc., 6 points; and (g) quality, suitability, and rarity of plants, 24 points; total maximum number of points, 100. The following points—in the same order as above—were actually awarded:—First prize, £75 and Silver Perpetual Challenge Trophy (Messrs. T. R. Hayes and Sons), 7, 18, 13, 9, 17, 6, 22, total 92 points; second prize, £50 and Large Gold Medal (Mr. K. Thirkildsen), 5, 14, 11, 10, 16, 6, 20, total 82 points; third prize, £30 and Gold Medal (Garden Supplies, Ltd.), 7, 15, 12, 8, 15, 4, 14, total 75 points; fourth prize, £20 and Silver-gilt Medal (Mr. E. J. Rigg), 6, 14, 10, 8, 15, 5, 16, total 74 points; and fifth prize, £15 and Silver Medal (Messrs. Hodsons), 6, 13, 11, 7, 15, 5, 15, total 72 points.

Liebnitz Exhibition.—The second Rose Show of the cycle of horticultural exhibitions being held at Liebnitz, in Germany, was marred by bad weather during the latter part of the time, and its success, notwithstanding this fact, was due to the excellent way in which it was organised. The centre of the hall was carpeted with green moss, against which the lovely colours of the Roses showed at their very best. Besides Roses, there were numerous groups of other seasonable flowers, such as Zinnias, Asters, Carnations, Delphiniums and Phloxes. It was intended that the cycle should close at the end of September, but it has been decided to extend it until October 2, which is the eightieth birthday of von Hindenburg, the President of the Reich, who is a patron of the Exhibition. The anniversary will be made the occasion of a festive wind-up to the exhibition, in which a military massed band concert will figure. The last of the cycle of shows, which will commence on September 27 will be an exhibition of fruit and vegetables.

Inspection and Certification of Strawberry Plants.—During the present season the Ministry of Agriculture arranged, on application, for the inspection of Strawberry plants from which runners are intended to be taken for sale, with a view to their certification as true to type. The certificates which have been issued relate solely to the purity of the stocks certified, and not to their freedom from disease, but in carrying out the inspections a careful watch has been kept for obviously unhealthy stocks, and where these have been found no certificates have been issued. A list giving the names and addresses of growers whose stocks have been certified has now been prepared, and copies can be obtained free of charge on application to the Ministry of Agriculture and Fisheries, 10, Whitehall Place, S.W.1.

Crop Production in Jamaica.—Practically the whole of the industry of Jamaica, which is the largest island in the British West Indies, is concerned with the production of crops, of which the Banana is by far the most important subject cultivated. In 1926 no fewer than 18,301,410 bunches of Bananas were exported, and it is anticipated that if favourable conditions prevail, a record of 20,000,000 stems of Bananas will be harvested in 1927. The production of coffee has declined considerably, and here the value of the Government Department of Science and Agriculture to the inhabitants is seen in the State assistance given of a free grant of 90,000 Coffee plants to the members of local branches of the Jamaica Agricultural Society, with a view to stimulating Coffee growing. Of Cacao, the output was increased from 2,600 tons to 3,000 tons last year, but fewer Coconuts were exported, although the number harvested, 23,000,000, would seem to be sufficient to satisfy all the fairs likely to be held anywhere. The chief use, however, to which the Coconut is put is not to supply amusement, but to yield Copra, of which the amount produced increased by some six-and-a-half millions pounds for the year. The islanders were also fortunate in harvesting a favourable Sugar crop, resulting in an export of 48,000 tons of Sugar, as compared with 37,700 tons in 1925. Perhaps because such a large area of North America has gone "dry," rum was stated to be in poor demand, although the official Annual Report of the Department of Agriculture puts

the blame on the very high duty on spirits in the United Kingdom. We learn that the fibre industry is steadily gaining ground, and the plantations of fibre-producing plants have been extended; the local invention of a portable decorticator has greatly stimulated the prospects of growing Sisal on medium areas of land with a moderate outlay of capital. It is also gratifying to learn that the Ginger crop was good, and that the Citrus industry shows some improvement. We are not surprised to learn that the production of Grape Fruit was very greatly increased, for this member of the Citrus family is becoming increasingly popular with consumers in this country. The report also contains an account of the activities of the public gardens during the past year, and, amongst other work done by them, not the least valuable was the distribution of no fewer than 417,831 plants to the islanders, mostly of economic subjects.

The "Grand Hall du Cinquantenaire" in Brussels.—A correspondent, M. L. Linden, of Ghent, writing to our Belgian contemporary, *La Tribune Horticole*, draws attention to the fact that the International Horticultural Exhibition just over in Brussels (September 10 to 18) was not the first to take place in the Grand Hall du Cinquantenaire, a former one having been held there in 1880. That also was an international show, and appears to have been very successful. Quite a different class of plants was then popular among growers and amateurs; among those who exhibited was a lady, Madame Legrelle d'Hanis, whose favourite plants were Marantas, cultivated as specimens. She also exhibited Alocasias, Colocasias and Caladiums, wonderfully grown. The chief interest of the show, however, was the friendly rivalry shown between those two great Belgian firms, Van Houtte and Linden. The writer recalls the two superb groups of stove foliage plants which were of such outstanding merit that it was difficult for the Jury to choose between them, and also the wonderful Orchids cultivated to a pitch now seldom seen. Probably few who attended the Brussels Exhibition this year were able to say that they had been present, much less that they had exhibited, and had carried off the premier honours, in 1880!

French Chrysanthemum Congress.—The twenty-seventh Annual Congress of the French Chrysanthemum Society is to be held at Paris this year, from October 26 to 28, and will coincide with the Centenary Autumn Horticultural Exhibition to be arranged by the French National Horticultural Society. Chrysanthemums will, of course, form a special feature at the exhibition, which is expected to arouse considerable interest among both growers and the general public. The Congress will be formally opened on Wednesday, October 26, at 9.30 a.m., at the offices of the Société Nationale d'Horticulture de France, 84, Rue de Grenelle, Paris, under the Presidency of the Minister of Agriculture, and a second session will take place in the afternoon, commencing at 3 p.m. On Friday, October 28, at 2 p.m., the exhibition will be opened at Cours la Reine; and Saturday will be pleasantly occupied by excursions, in the morning, to the municipal nurseries of Paris, at Auteuil, and in the afternoon to the Reuilly establishment of Messrs. Vilmorin, Andrieux et Cie. At 9 p.m., there will be a reception at the offices of the Société Nationale, Rue de Grenelle. The subjects for discussion at the Congress include the use of sulphur in composts; the use of fertilisers in the open; pests and diseases; and suggested modifications in the mode of nomination and functions of the Floral Committee. A number of valuable Cups and other prizes will be competed for by Chrysanthemum growers at the autumn exhibition, including the "Coupe C.P.," given by the Comptoir Parisien d'Engrais, which is not, however, actually a cup, but a prize to the value of 1,000 francs to be divided among four growers of the most remarkable varieties; the Prix Gaston Clément, value 200 francs, for the most interesting new variety shown during 1927; the Prix Paul Féron, 100 francs; prix Charles Souchet, 100 francs; and prix Auguste Nonin

100 francs. The Société Française des Chrysanthémistes is also offering a prize of 200 francs to the grower obtaining the greatest number of Certificates of Merit.

Appointments for the Ensuing Week.—**MONDAY, SEPTEMBER 26:** National Chrysanthemum Society's Floral and Executive Committees meet. **WEDNESDAY, SEPTEMBER 28:** Royal Horticultural Society's Autumn Exhibition at Holland Park Hall (three days). **THURSDAY, SEPTEMBER 29:** Paisley Florists' Society's meeting. **FRIDAY, SEPTEMBER 30:** Carlisle Chrysanthemum Society's show. **SATURDAY, OCTOBER 1:** Wallington Horticultural Society's show; Blackburn and District Horticultural Society's meeting.

bohea in the southern parts of China employed for making black tea; and in proceeding as far north as Shanghai, he found the *Thea viridis* used in making green tea near the districts where the best green tea was made. So far, therefore, the information obtained seemed to confirm the view of two different species of *Thea* being employed to make the two different kinds of tea; but Mr. Fortune, in visiting the district of Fokien, was surprised to find what he conceived to be the true *Thea viridis* employed in making black tea in districts near where the best black tea was made. He took plants with him from Fokien to Shanghai, and could find no difference between them. It was still, however, desirable to get specimens from the district where the black and green teas of commerce were actually

FIG. 109.—CATTLEYA HOROS.

R.H.S. Award of Merit, Sept. 13. Flowers golden-orange and cerise. Shown by Baron Bruno Schröder. (see p. 236).

"Gardeners' Chronicle" Seventy-five Years Ago.—*The Black and Green Teas of Commerce*, by Dr. Royle.—It was a remarkable fact that the subject of the difference between the black and green teas had been, until recently, a matter of great uncertainty. The Jesuits, who had penetrated into China, and Mr. Pigou, were of opinion that both the black and green teas were produced from the same plant, while Mr. Reeve believed that they were manufactured from two distinct plants. Now as regarded himself, he (Dr. Royle) had adopted the view that the best kinds of black and green tea were made from different plants; and examination of tea samples seemed to confirm that view, but a repetition of the experiment had not done so. Mr. Fortune, subsequent to the China war, having been sent out to China by the Horticultural Society of England, made inquiries on the subject. He there found the *Thea*

made, and this had latterly been effected. In consequence of the great success which had attended the experimental culture of tea in the nurseries established in the Himalayas, Mr. Fortune was again sent to China by the East India Company. He proceeded to the northern parts of the country, in order to obtain tea seeds and plants of the best description, as the most likely to stand the Himalaya climate. Mr. Fortune procured seeds and plants in great numbers, and sent them to the Himalayas, where they had been since cultivated. When he had reached Calcutta, the tea manufacturers, whom he had brought with him, made from plants in the Botanic Gardens their black and green tea from the same specimens; so that it was evident it was the process of manufacture, and not the plant itself, that produced the green tea. *British Association Gard. Chron., September 25, 1852.*

The Week's Work.

THE ORCHID HOUSES.

By J. T. BARKER, Dunstable, Bedfordshire.

Masdevallia.—The strong-growing species of *Masdevallia*, such as *M. Harryana* and *M. Veitchii*, comprise plants that were at one time more appreciated than any other Orchids. It is advisable to examine the whole of the stock and repot any plants that require it; or to re-surface where this only is necessary.

Compost.—The compost should consist of good fibrous peat, A.I. fibre and Sphagnum-moss in equal parts, with sufficient broken crocks to render the whole porous. The fibre used in the compost should be thoroughly cleared of all earthy particles, as these plants, when well-rooted, require an abundance of water. Ordinary flower pots are suitable for such as can be accommodated in reasonable-sized pots, but large specimens are best grown in deep pans, or half-pots, as they are sometimes termed. Which ever receptacles are used, the drainage should be perfect. Certain species of *Masdevallia* have stronger growth and more robust roots than others, and these should be given slightly more pot-room than those of a less robust constitution, but over-potting is harmful. Whenever a plant shows signs of decay in the centre it should be broken up, and the old, decayed rhizome removed. The outer parts that are sound and vigorous may be remade into a specimen, or potted separately, according to requirements.

Remaking Specimens.—In arranging the portions to make one large specimen, make quite sure there is new rooting-material between the sections as they are placed together. By arranging the portions together in this way it is possible for the plants to develop in every direction in a natural manner.

Repotting.—Plants that are in a thoroughly sound state, with good centres, will be benefited by shifting them into larger pots, being careful to disentangle the roots, and remove all sour and decomposed rooting-material. If any of the stronger growers have made a large number of roots and are not afforded new rooting material there is a danger of the plants presenting a sickly, unhealthy appearance before another season comes round, and it is always much easier to keep a healthy plant in sound condition than to nurse an unhealthy one back to good health. *Masdevallias* grow best in a rather shady part of the cool or *Odontoglossum* house, in a position near to the roof-glass, where they may be shaded from strong sunshine. Although they enjoy plenty of light, they are not capable of withstanding the strong rays or the heat of the sun, as they require a cool, humid atmosphere the whole year round. Thrips, which disfigure the foliage, and in the end eventually ruin the plants, must be constantly searched for, and on the first appearance of the pest the house should be vaporised, which is the cheapest means of cleansing a house of plants of various insect pests.

THE KITCHEN GARDEN.

By R. H. CROCKFORD, Gardener to THE RT. HON. LORD WAVERTREE, Horsley Hall, Gresford, N. Wales.

Leeks.—Where this useful vegetable is growing in trenches more soil should be worked around the stems to bleach them. If the leaves become very long their ends may be shortened to prevent worms from drawing them into the earth. The same care should be exercised in the case of plants grown on the flat. Hoeing between the rows will favour the growth of the plants as well as keep down weeds. Leeks which are being grown for autumn exhibitions should have attained their full length by now, and care should be taken to prevent the soil from splashing into the tops of the stems. Continue to feed the roots outside the boards or planks supporting

the earth, with liquid manure, or a good fertiliser, until the plants have grown to full size. Watch carefully for caterpillars, which may often be found feeding on the leaves and sometimes in the crown, thereby spoiling the whole plant.

Potatos.—Every opportunity should be taken to lift and store the tubers so soon as they are ready, or many may become diseased, especially on wet land. When storing Potatos discard any which show the slightest trace of disease, or the latter will spread throughout the clamp. The tubers should be lightly dusted with slaked lime when any fear of disease is anticipated.

Celery.—Extra precautionary measures should be taken during this particularly dull and wet season to prevent disease from spreading on Celery. I have used green precipitated sulphur with great success, and find it an excellent remedy. It should be dusted over the entire plants by means of a blower, or dry spray distributor, repeating the process every ten days, or even oftener, if the weather is very wet. Celery growing in these gardens, in a cold, heavy, wet soil, is free from disease at the time of writing.

Endives and Lettuce.—Continue to plant these salads in cold frames. No attempt should be made to coddle the plants, but allow them to grow as hardily as possible, and keep the lights off the frame for the present.

FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P., Ford Manor, Lingfield, Surrey.

Early Peaches.—Where the removal of any of the trees is contemplated, all preliminary operations, including the preparation of the compost, should now be proceeded with. The need for good drainage is imperative, and where the soil is a strong, calcareous loam, gritty matter of some kind, such as old lime rubble, should be added to render the texture porous. Trees to be transplanted and expected to fruit next season should have been lifted or root-pruned last autumn; provided they are under glass, they may be removed with safety any time in September. It is always wise to grow a number of young trees against a wall as reserve stock, and when these are planted to replace them with younger trees from the nurseryman. Such trees may be kept trained and in a suitable condition for lifting, shortening the roots annually and replanting them in poor, rather than rich, compost, until they are six or seven years old.

Root-pruning.—Any trees that require root-pruning or lifting should now be attended to, and with careful attention to shading and syringing of the foliage, they will be fit for starting at the usual time. Shorten nearly all the strong roots to within six inches of their origin and relay the fibrous ones in fresh loam. Occasionally it may be necessary to remove a good deal of the surface soil and substitute fresh compost, as the hard soil about the roots of old trees often becomes dry, and many cases of bud dropping may be traced to drought. Give the roots one or two good soakings with water before lifting is attempted, then do the work carefully and quickly. When the tree is placed in position and the shoots tied loosely to allow for the soil settling, the latter should be thoroughly washed in amongst the root fibres with tepid water. All trees, no matter how old, should be detached from the trellis and carefully washed with strong, soapy water and sulphur; the wires and woodwork should also be washed with this mixture.

Successional Houses.—The roots of fruit trees in successional houses should be kept thoroughly moist, certainly until the leaves fall, when the trees should be cleansed and the house kept freely ventilated until the time arrives for starting them into growth again.

Late Houses.—So soon as the trees in late houses are cleared of their crops, wash them well

with the hose. Close the house with sun-heat on fine afternoons until the wood is ripe, and keep the atmosphere dry. Much may be done to ensure the ripening of the wood by thinning the shoots to allow light and air to enter freely. A little fire-heat will do no harm, provided ventilation is given on a liberal scale.

Winter Cucumbers.—Make preparations for obtaining a supply of Cucumbers throughout the winter. This crop usually follows the second crop of Melons, and the house is generally infested with spider and other insects. First remove the old soil and the fermenting materials of the old hot-bed. Cleanse the glass and paint with warm, soapy water, and coat the walls with boiling water, quicklime and sulphur. Sufficient fermenting materials and compost should be prepared in readiness for planting. The soil should be dry and free from worms. A liberal dressing of soot will destroy worms, and if the compost is poor it may be enriched with bone-meal in preference to animal manure.

HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD Wrotham Park, Barnet, Middlesex.

Strawberry Beds.—Not for three seasons have Strawberry plants grown so freely as they have this year. Both old and young plants are looking exceptionally healthy, and only sunshine is needed to assist the plants in building up firm growth and well-developed crowns. Perfect maturity of growth will also lessen the danger of injury by severe frosts. Keep all plants intended for fruiting free from runners and the beds from weeds. If the land is of a light and porous texture mulching the ground with manure will greatly benefit the plants. Keep Strawberries in nursery beds free from both runners and weeds. The more forward runners may be lifted with a ball of soil adhering to the roots and planted afresh.

Gooseberry Bushes.—The bushes have made good growth, notwithstanding the heavy crops they have produced. If the shoots are very crowded, the present is a suitable time to thin out any that can be spared. All fruit-bearing shoots should be freely exposed to both sun and air to favour the ripening of the wood before the end of the season. By thinning the shoots at the present time the need for winter pruning will be greatly reduced. Do not shorten the fruiting wood but simply open out the heads of the bushes now and complete the work of pruning at a later period. Young bushes planted on suitably prepared land, will, if the autumn proves favourable, furnish a fairly good yield of fruits next summer.

PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NALL-CAIN, Brocket Hall, Hertfordshire.

Chrysanthemums.—Plants that are being grown to produce large blooms should be placed under glass. It is not advisable to house Chrysanthemums too early, but, as a rule, after this date the plants are no longer safe from frost, and as many varieties are showing colour, the night dews will spoil the florets, the injury showing at a later date. The late-flowering varieties are best kept out-of-doors as late as possible, otherwise growth will be weak and the flowers of poor quality. It is, however, always wise to have some protective material near at hand, and at the first sign of a sharp frost to remove the plants to safety. After housing the plants a watch should be kept for mildew, and the affected parts dusted with sulphur on the undersides as well as the upper-surfaces of the foliage. Fumigate the plants on two or three occasions to keep aphids in check, this pest being always more prevalent in wet than in dry seasons.

Violets.—Plants that have been grown outside to produce flowers during the winter and spring may now be lifted and replanted in frames.

It sometimes happens that September is very hot, and if the plants are not lifted carefully the foliage may flag considerably, followed by damping. Should the weather be dry at the time of lifting the plant's roots should be well watered. Remove all runners before planting, and should red spider be in evidence, dip the plants in a suitable insecticide, taking care to wet the underside of the leaves. Violets grow best in a light compost containing bone-meal and wood-ash. Plant moderately firmly and see that the crown is level with the soil. The space between each plant will depend entirely on their size; as a guide, I recommend putting them five inches asunder. Should the weather be showery at the time of planting, the lights should be left off the frames, but if it is hot and dry place them in position and afford slight shade to enable the plants to recover quickly from the disturbance.

Caladiums.—These plants are past their best and to ensure perfectly ripened growths, water should be withheld gradually. It is not advisable to dry these plants off too drastically, otherwise the tubers will fail to mature properly. Much of next season's success will depend on the treatment extended to them during the ripening stage. When the foliage is completely died down, the tubers should be stored under a stage in a moderately warm house where the night temperature never falls below 50°. The tubers will keep best in the receptacles they are growing in, the soil affording sufficient moisture to prevent shrivelling. When shrivelling occurs the tubers rarely recover, and will be found to rot when starting them into growth next season.

THE FLOWER GARDEN.

By JOHN COUTTS, Assistant Curator, Royal Botanic Gardens, Kew.

Phlox decussata.—When these plants have finished flowering, a good supply of cuttings may be obtained. Cuttings inserted in a bed of sandy soil in cold frames soon form roots and will be ready for planting out next spring. Much better results are obtained by raising young, healthy stock from cuttings than by dividing the old plants; there is also less danger of attacks by eelworm, which may, to a certain extent, be kept in check by liming the soil and by changing the site of the plants. Seeds should be saved from good varieties, sown at once, in pans or boxes, and germinated in a cold frame. The germination of Phlox seed is somewhat slow and uncertain, but if sown when ripe the young plants should be ready for planting out next spring in the reserve garden, or even in the garden proper, as they give a fine display their first season.

Rose Cuttings.—Many varieties of garden Roses may be raised successfully from cuttings inserted out-of-doors during October. A sheltered, west border is very suitable for this purpose. Make the cuttings from old flowering shoots, as such growth is fairly firm. They should be taken off with a heel, which should be trimmed smoothly and none of the lower buds should be cut out. The cuttings may be made from four inches to six inches long, and lined out in the same way as Gooseberry cuttings, treading them in the soil firmly. After frosty weather it will be necessary to examine them, for frost partly lifts them up leaving the base of the cutting clear of the ground. In such cases they should be trodden firmly in again. Although most Rose cuttings will form roots not all of them will grow; some varieties may make a bundle of fine roots but little or no top growth. Nearly all the rambling Roses and the dwarf polyantha varieties are easily raised from cuttings.

Hibiscus syriacus (syn. Althaea frutex).—This handsome flowering shrub makes a fine display late in the season, especially in the warmer parts of the country. There are numbers of varieties, both single and double-flowered; the single-flowered Celeste is especially beautiful, the flowers being a pleasing shade of blue. The Hibiscus enjoys a sunny situation and a rich, moist, well-drained soil. It is readily increased

by means of cuttings inserted during the summer or autumn, when they may be rooted in a close case, or the plant may be increased by grafting on portions of the roots during the spring.

Zephyranthes candida.—This bulb has white, Crocus-like flowers, and at the time of writing is in full bloom. Here, at Kew, many hundreds of yards of it are used as edgings to paths and borders around the plant houses and also in the open. Zephyranthes candida is a native of the Argentine; it has graceful, evergreen foliage, and flowers with wonderful profusion. It increases very rapidly and may be planted at any time, except, perhaps, during the dead of winter.

Hedges.—Where hedges were trimmed earlier in the season they will now, in most cases, require to be gone over the second time. Holly and Yew hedges should be trimmed at this season. Holly is usually clipped; but if time can be spared it is better to trim the growths with a knife or secateurs.

General Remarks.—Complete the work of pruning and tying rambling Roses. The young shoots of climbing Roses trained on pillars

FIG. 110.—OPHIPOGON JABURAN VARIEGATUS (see p. 244).

or pergolas should be secured to the supports to prevent them being broken or damaged by high winds. Herbaceous borders and flower beds generally should be kept tidy; trim off spent flowers and keep the plants staked and tied neatly. Where groups of annuals and other early-flowering subjects are finished the blank spaces may be filled with hardy Chrysanthemums and Michaelmas Daisies that have been grown in the reserve garden for the purpose. All climbers and shrubs grown and trained on walls should be examined and made secure against high winds, pruning them back where they are exceeding their prescribed limits.

FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF AILSA, Culzean Castle, Maybole, Ayrshire.

Cuttings in Frames.—The cuttings of many kinds of summer bedding plants and those of Pentstemons, Calceolarias, Nepeta, Myosotis, etc., should be inserted without further delay. In some districts Pentstemons are infected with a disease which attacks the foliage, leaving it brown and hard, and in consequence growth is arrested. Infected plants do not produce cuttings in quantity like the healthy ones, but where it is necessary to propagate any variety showing traces of this disease, the cuttings

after insertion should be sprayed occasionally with a weak solution of sulphide of potassium. This treatment may be applied to any kind of cuttings which are doubtfully diseased; Violas are sometimes attacked by a leaf-spot fungus, which in the close atmosphere of a shaded frame spreads with great rapidity and leaves many blanks among the cuttings. The newer hybrid Calceolarias have been quite satisfactory out-of-doors this summer, and where cuttings of these are procurable they should be rooted in the usual way to produce good plants for next season, while the stools may be lifted and potted to furnish early-flowering plants under glass. The preparation of the frames for the reception of the cuttings should be done carefully, and liberal supplies of leaf-soil added where necessary, making the bed firm by treading, and surfacing the whole with a good layer of sand. The sashes which have been stored during the summer should be washed with hot water mixed with soap and paraffin, and the glass well rinsed with clean water. When they are dry, cracked panes or loose putty should be made good.

Housing Plants.—Many kinds of plants which may be grown in frames or out-of-doors with advantage during the summer should be brought indoors, where they can be kept at least free from frost. They include Zonal Pelargoniums, Salvias, Chrysanthemums and Richardias. As the various houses containing crops of Melons, Cucumbers and Tomatos are cleared and cleansed they may be filled with winter-flowering plants. When the plants are taken indoors, leave the ventilators open night and day for a time unless frost threatens, in order that the plants may become accustomed gradually to their new conditions. Keep a sharp watch for insect pests, and fumigate the houses on their first appearance, and subsequently as found necessary.

Gathering Fruits.—The earlier varieties of Pears, such as Beurré Giffard, Jargonelle, Dr. Jules Guyot and Clapp's Favourite, have already been harvested, and the second-early sorts now require attention. These include such well-known varieties as Beurré d'Amanlis, Williams's Bon Chrétien, Pitmaston Duchess, Marguerite Marillat and Souvenir de Congress. As a general rule the fruits near the top of the trees ripen first, whether in the open or against a wall, and these should be removed from the trees wherever it is found that by raising the fruits to a horizontal position the stalks part readily from the spur, leaving any which do not and replacing the nets for a few days, when the fruits should be tried again. Label the various sorts distinctly when laying them on the fruit-room shelves, and allow sufficient space for each variety so that the later fruits may all be accommodated together. It is also a help to put on the labels the approximate season when the different varieties may be in a fit condition to send to the table, and a close watch kept on the later sorts, securing them in a like manner when ready. Where wasps are troublesome among late fruits they should be traced to their nests and destroyed by cyanide of potassium, which, however, should only be used by those who realise its power and the danger involved in using it.

Celery and Leeks.—These winter vegetables should now be well earthed up to protect and blanch the stems. Celery for market is largely grown on the flat, and when a plough can be used to throw up the soil against the plants the earthing-up is soon completed. With trenches more care is necessary to keep the fine soil from getting into the hearts of the plants, which should be tied together with raffia before earthing-up begins. On heavy soils which are infested with slugs, Celery is a most disappointing crop, as these pests are difficult to eradicate, and lime, soot or alum, unless applied frequently, soon lose their effectiveness. Grown in sandy soil near the shore, Celery is one of the easiest and most satisfactory crops to cultivate, and the heads when dug are clean and spotless. In earthing-up the general crops of Leeks, it is sufficient to stir the soil deeply between the rows and draw the loose soil up to the plants on either side with a hoe, thus adding a few inches to the blanched portion which is underground.

INDOOR PLANTS.

OPHIOPOGON JABURAN VARIEGATUS.

THIS is not a very old greenhouse subject, its introduction from Japan dating back only sixty-four years, which fact, no doubt accounts for the plant being little known in some gardens. Its variegation renders it at all times a more or less useful plant for decoration under glass, while it stands well when used as a pot plant for the dwelling. The colouring of the foliage improves wonderfully after the completion of the new growths, and is, in the writer's opinion, quite equal to that of some *Codiaeums*. To add to the value and usefulness of this plant it sends up, annually, a number of slender spikes of blue flowers during August or September (Fig. 110), p. 243. The flowers are not long-lived; never the less they are a source of beauty and add an interest to the greenhouse at this season.

Given light soil and a warm situation, this *Ophiopogon* will succeed out-of-doors during the summer months, but it always strikes me as being more at home in a slightly heated greenhouse. Plants may be divided after flowering, if increase is desired. *C. T., Amptill Park.*

MIGNONETTE IN POTS.

It has often been said that only one gardener in ten is able to grow Mignonette in pots to perfection. While this is possibly an exaggeration, it is nevertheless true that many fail to obtain good results.

Mignonette is so useful and popular as a pot plant, that every effort should be made to ensure its success. The usual time to sow seeds for the spring batches is during August and September. Mignonette resents root disturbance and loose potting, so the best method of procedure is to sow the seeds in the receptacles in which the plants are to flower. A small portion of the batch may be grown in forty-eight-sized pots and the bulk in thirty-two's. Those grown in the larger size usually make the best specimens, but the smaller pots are often more suitable for general use.

The potting compost used should consist of four parts loam, one part decayed leaf-mould, and a half part of sifted manure from an old Mushroom bed. To each bushel of this compost add a four-inch potful of bone-meal, a similar quantity of wood-ash, and a liberal sprinkling of sifted lime rubble. The whole should be turned several times and thoroughly mixed a few days before required for use. The soil must be rammed firmly before sowing the seeds, using a potting stick for this purpose and following with a good soaking of water. After the moisture has drained away, sow from a dozen to twenty seeds in each receptacle, and lightly cover them with compost applied through a fine sieve.

The pots may be placed in a cold frame and kept shaded until germination takes place, when exposure to light is necessary; grow the seedlings as hardily as possible, and when they are an inch or so high, reduce them to five in each pot.

After October the batch may be removed to a shelf in a greenhouse from which frost can be excluded, and the plants grown on steadily through the winter months. When the roots have taken full possession of the soil, clear soot-water, or some other weak stimulant, may be applied. A neat stake should be placed to each plant before it becomes tall enough to fall over.

Most of the giant-flowering strains are suitable for pot culture, and when their period of usefulness in the house or conservatory has passed, they may be cut back and removed to a cold frame. When they have been hardened off the plants may be turned out of their pots without breaking the ball of soil, and planted in a position out-of-doors, in firm, rich ground. If put out at the end of May these will flower before the spring-sown seedlings, and will continue to supply flowers until the autumn, provided they are cut over occasionally and the old flower spikes removed. *Charles Hodgson, Acton Place Gardens, Sudbury, Suffolk.*

ALPINE GARDEN.

ORCHIS FOLIOSA.

ONE of the most delightful of hardy Orchises is the Madeiran *Orchis foliosa*, but, unfortunately, it is not always the easiest of plants to manage. At Kew it is planted in a low-lying bay in the rock garden (Fig. 113, p. 249), where it flourishes in a sheltered and sunny position. In this position, although the site is well-drained, the plants receive a fair amount of moisture and a good deal of rain is shed on the site by the rocks above. Suitable soil for *Orchis foliosa* appears to be a mixture of peat, sand and leaf-mould. Even under the best conditions, however, it rarely carries spikes so tall as two feet seven inches, which is the height recorded of a specimen gathered in Madeira by Mr. Lowe (*Bot. Mag.*, t. 5074). But even if only half so tall, its spikes of purple flowers are a delight in any garden. *Orchis foliosa* used to grow well at Straffan, under the late Mr. Bedford's care, as, indeed, did many hardy Orchids, notably the handsome *Cypripedium spectabile*. *K.*

ASTILBE CHINENSIS PUMILA.

THIS dwarf, herbaceous perennial is suitable for the bog-garden or for cool, moist places in the rock garden, and is of special value in that it flowers freely during late summer and early autumn. It is hardy and of compact and neat habit, producing numerous clusters of leaves from the centres of which arise erect flower stems twelve inches or more in height. These are usually furnished with a single leaf about half-way up, and are thickly covered with brown hairs. The rich rose-purple flowers are packed closely together on branched spikes, six inches or more in length. The radical leaves are tri-pinnate and about seven inches in length; the grooved stalks are red-tinted and sparingly clothed with rough, fibre-like hairs. The light green leaflets are ovate and sharply pointed, the margins sharply toothed and tinted with red.

The cauline leaves are much smaller than the radical foliage, but are of similar shape, the margins being finely toothed and conspicuously red tinted, while the hairs, especially on the stalks and undersides are much thicker.

This *Astilbe* delights in deep, rich soil and abundant moisture. It is easily increased by division, and comes practically true from seed. *A. G. Forsyth, Wisley.*

HYPERICUM REPTANS.

THIS is undoubtedly one of the best of the dwarfer St. John's Worts, and I know of no other prostrate species to rival it in general garden merit. A native of Sikkim, it is, perhaps, not absolutely hardy everywhere, but in a really free, gritty soil with a broad, flat rock slightly inclined in a southerly aspect, for it to creep over, *H. reptans* usually survives the winter.

A well-grown plant will eventually cover several square feet with a dense, one-inch carpet of a delicate, fresh green, often more or less flecked with touches of orange.

The flowers, which are fully an inch across, lie upon this green carpet, and they are a rich golden yellow, not infrequently streaked with crimson, while the buds are a glossy vermilion just before they expand.

The blooming season, unlike that of so many of the lesser *Hypericums*, continues in full vigour throughout the summer and well into the autumn. Cuttings strike readily at this season, and as growth is rapid, these make good flowering plants the following year. In districts where the plant is liable to suffer from wet and cold in winter, it should be afforded protection with a sheet of glass arranged above it. *A. T. J.*

ERYNGIUM PROSTRATUM.

THE tiny *Eryngium prostratum*, which is surely the very smallest of the Sea Hollies, is at present in bloom as this is written (September 16), and is the object of considerable interest and curiosity. I am assured that it is perfectly hardy, but, as it comes from Texas, I should like to reserve judgment on this question until this winter has passed. Should it prove hardy it will be one of the pleasing curiosities of the rock garden—and all curious plants are not pleasing. It is about four inches high only, and

has small, spiny leaves on a rosette-like plant, and from this tuft emerge the prostrate stems carrying the tiny flowers, which in form present all the characteristics of the taller Sea Hollies, and are of a pretty blue-grey colour.

It is not, of course, a showy or eye-attracting subject, but it is one full of miniature beauty, and cannot fail to be of special interest to the many admirers of the larger Sea Hollies. Mr. Reginald Farrer was doubtful of its hardiness, or, otherwise, considered it might be only a biennial, like *E. giganteum*. Although *E. prostratum* loves damp places in its native country of Texas, it will probably require a moderately moist soil only in this country, except in the south of England.

SISYRINCHIUM CALIFORNICUM.

THE Californian Satin Flower is an attractive border or rock garden plant, and is hardier than is generally believed. It is not so attractive as either *S. grandiflorum* or *S. filiferum*, but it is of elegant habit and the yellow flowers are very pretty. The plant grows about twelve inches high and usually flowers in June, but this year my specimen only came into bloom in July, and it is still giving a number of its light yellow flowers above the pleasing, Rush-like leaves, and promises to bloom for some time yet. *Sisyrinchium grandiflorum* requires a sunny situation and a dry soil. *S. Arnott.*

A REVISION OF VIOLAS

(Continued from page 229).

V. NEBRODENSIS, Presl., is a dwarf, almost stemless plant, with one to three yellow or pale violet flowers on long peduncles, with the spur rather thick and obtuse but longer even than in *V. calcarata*, and the lowermost petal more rounded. The leaves form almost rosettes and are ovate, crenate, almost glabrous, obtuse, the lower ones narrowing into long petioles. The stipules are pinnately divided into one or two short, linear lobes on either side of the long leaf-like, central segment. Its characters thus separate it from the *Calcaratae* group. *V. nebrodensis* takes its name from the Nebrodes or Madonia Mountains in Sicily, where it grows at between 5,500 and 6,300 feet. A yellow form (sub. sp. *lutea*) which is downy and has leaves cordate or oblong at the base, is found in grassy places about 4,000 feet above Palermo; and a pale violet form (sub. sp. *grandiflora*) which is taller, has larger flowers and a shorter spur, leaves flatly cordate and very large stipules, occurs on shady limestone rocks at about 2,900 feet in the same district.

V. nephrophylla, Greene, belonging to the same section as *V. cucullata*, grows in boggy places by the sides of rivers and lakes from Newfoundland and Connecticut along both sides of the frontier to the Pacific Uplands, then south along the Rockies to the borders of Mexico. It thus has probably a wider range than any other North American Violet. The type was collected by Greene in dry thickets in Colorado, so the species is apparently not exclusively a bog plant. The large violet flowers are held well above the pale green leaves.

V. nevadensis, Boiss., should be *V. crassiuscula*, Bory, and is akin, as Farrer suggests, to *V. crassifolia*, though the former is found on the Sierra Nevada in the south of Spain and the latter in Armenia. It is a *Cenisia* *Viola*, but sends up numerous, long, slender stems, leafless at the base, with entire, round-ovate, glabrous or minutely pubescent leaves on petioles longer than the blade, with stipules that are quite leaf-like and never have lateral lobes, a very short, obtuse spur, and rounded petals that vary from the coerulean of *V. cenisia* to violet, and may be reddish or white. It has hitherto been reputed to grow in the highest screes of the Sierra Nevada from just below 10,000 to over 11,000 feet, but Mr. Lofthouse has on several occasions in recent years collected it at much lower altitudes. He has distributed seeds, some of which, I understand, are giving good results. *E. Enever Todd, Lt.-Col.*

(To be continued).

FLOWER GARDEN.

TRIENTALIS EUROPAEA.

Those who are planting woodland gardens, or any cool, partially-shaded spot, during the coming season, should not overlook the merits of this *Trientalis*. Rare native plants are always interesting in the garden, and *Trientalis europaea* is not only an uncommon wildling, but is possessed of singular elegance and beauty. It grows to a rather lesser height than a Wood Anemone and has much the same poise.

The slender stem carries a single whorl of lanceolate leaves, above which the flowers are held on delicate, hair-like stalks. Though small, these pure-white, starry blossoms are very bright, and have a distinct air of refinement and quality.

T. europaea belongs to the natural order Primulaceae; it is an excellent little plant for associating with dwarf Ferns, the smaller, shade-loving Anemones, and other lowly herbs which enjoy a free but moist vegetable loam. There is an American form of *T. europaea* which is said to be larger in all its parts than our own, but of this I have had no experience.

TRITONIA ROSEA.

THIS South African plant, closely allied to *Montbretia*, and sometimes known as *M. rosea*, is not common in gardens generally, yet it is quite hardy in all but the coldest localities. As a matter of fact it is very much more reliable and permanent in the borders here than any of the newer, large-flowered *Montbretias*.

T. rosea needs to be grown in a free soil of a gritty or sandy nature. With me, it never increases to the extent of becoming a nuisance, as some of its congeners so readily do when neglected, and groups which have been established for over ten years without lifting or receiving any attention whatsoever are still doing well.

T. rosea grows about two feet tall; the narrow foliage is sparse and pale green. The tubular flowers are an unusual and very attractive shade of shrimp pink; they are produced in abundance from June to October. *A. T. J.*

ERYNGIUMS.

THE Sea Hollies are umbelliferous plants of real garden value which may be grown in any ordinary garden soil in an open, sunny position. Owing to the metallic-blue of their stems and spiny leaves they are highly decorative subjects and very effective in the border during the later summer.

The genus consists of a very large number of species of hardy or tender herbaceous perennials, several of which are useful border plants. *E. Oliverianum* is one of the best; it is of good habit and produces large heads of flowers of a lustrous metallic blue. *E. amethystinum* is a very ornamental plant with beautiful Thistle-like heads of flowers of a glistening amethyst-blue. *E. alpinum* is a handsome plant producing large heads of flowers of a soft lavender-blue on stems of a deeper blue, and is very effective. *E. planum*, which is one of our oldest garden plants, has much smaller flower heads, but they are borne in rich profusion, and the plant is still worth growing. *A. P. C.*

PHYSOSTEGIA VIRGINIANA.

PHYSOSTEGIA VIRGINIANA, or False Dragon-head, is a rather uncommon herbaceous plant which has flowered remarkably well during the last two months. It does not usually exceed four feet in height.

The stems are erect, slender, square and clothed with opposite, sessile leaves, which vary in shape from lanceolate to ovate, with irregularly and sharply serrated margins.

The inflorescence consists of a terminal panicle, either simple or branched, on which the flowers are disposed in whorls of two. They are flesh-coloured or purple, and are produced from July to the end of September.

Physostegia virginiana is synonymous with *Dracocephalum virginianum*; it may be easily raised from seeds sown in gentle heat in March, or from cuttings of young shoots inserted in a cold frame in April, whilst old clumps may also be divided in autumn. *R. K.*

FLOWERS IN THE KITCHEN GARDEN.

WHILST the fruit and vegetable garden is almost as interesting as the dressed grounds in summer and autumn, when fruit trees and bushes are carrying their bright fruits and the culinary crops providing a variety of interests, this quarter of the garden is not very inviting in winter and early spring, yet it may be made attractive at these dull seasons by the use of a few suitable early flowers.

Where the kitchen garden is of fair extent a number of flowers may be included at appropriate spots without interfering with the legitimate crops, and they will serve a double purpose, one of which is to supply cut blooms. On a border at the foot of a north wall Christmas Roses and *Petasites fragrans* may be planted to provide outdoor flowers in the dead of winter, when an edging of *Erica carnea* will also be attractive. Clumps of *Iris stylosa* in odd corners, where they will not clash with the vegetables, will also furnish outdoor blooms for cutting, and these plants are often in bloom when covered with a mantle of snow. Wall-flowers lining the paths, or a few of these fragrant flowers grown in rows where the ground will

as Brocket and Aldenham some of the borders in the kitchen garden are planted with hardy herbaceous subjects, which can be drawn on in summer to furnish flowers for indoor decoration, and thus save cutting those in the pleasure grounds.

HARDY FLOWER BORDER.

KIRENGESHOMA PALMATA.

A BOLD clump of this Japanese plant some three feet high, and four feet to five feet across, has been a very imposing object in a mixed border throughout the autumn. The flowers are a waxen ivory-yellow, and they greatly resemble half-opened blooms of a single Dahlia. The smooth stems are dark brown and glossy, and these make a striking contrast with the foliage when the latter has assumed its yellow autumnal tints.

K. palmata is a herbaceous perennial and a fine subject for a partially-shaded position where the soil is well drained, yet moist and rich. As it flowers from late August onwards, it is especially useful for autumn effect. It is very

FIG. 111.—DAFFODILS UNDER TRAINED FRUIT TREES AT BROCKET HALL.

not be wanted for a very early crop, will give fragrance and beauty quite early in the year, when the Polyanthuses are also sending up their showy trusses. The Wallflowers may be discarded when they have finished flowering and the Polyanthuses transferred to another place where they will not be in the way.

The good-natured and very floriferous Pink Mrs. Sinkins makes a capital edging subject, quite as attractive in winter with its silvery-grey foliage as the more orthodox edging of dwarf Box; indeed, there are plenty of other flowering subjects that may be used as permanent edgings in the kitchen garden. But undoubtedly the best of all plants for the purpose under notice are bulbs, such as Daffodils and Tulips. The illustration in Fig. 111 shows Daffodils blooming at Brocket Hall, Hatfield, in narrow borders under a canopy of Apple trees, where few other things could be attempted. Mr. Pateman also plants colonies of Daffodils, of varieties that are especially valuable for furnishing cut blooms, in various other parts of the kitchen garden and where they are not required to remain, the bulbs are lifted so soon as they have had a reasonable time to ripen, and planted out in grass land. In such large gardens

effective as a background to a group of *Gentiana asclepiadea*, the Willow Gentian, the soft yellow of the one and the blue of the other making a most charming and harmonious combination.

K. palmata seldom needs any attention, and established specimens may be left undisturbed for many years. Propagation is easy by division or detaching rooted portions of the plant. *J.*

COMMELINA COELESTIS.

Mr. ARNOLD remarks, on p. 107, the blue of the flowers of this plant is of peculiar purity and loveliness, and is enhanced by the golden stamens and the bright green foliage. My plants were raised from seeds some years ago and they are planted in a fairly sheltered border. Slugs were troublesome to the plants when they were young, but they do not seem to harm them much now. I do not find, however, as Mr. Arnold does, that this *Commelina* flowers in June. It does not appear above ground until then; in fact, every year I wonder whether it means to come up at all—and with me it does not flower until August. *W. R. J., North Cornwall.*

FLORISTS' FLOWERS.

BORDER CARNATIONS.

THIS SEASON'S NOVELTIES.

THAT the culture of the border Carnation is steadily increasing is made evident by the number of varieties sent out, and which pass into the general collection every autumn, only to be succeeded by further novelties.

This year, I think, more call for special mention than usual. Bookham Beau, heavily marked scarlet, is a beautiful flower. Esmé Murray, very large, heavily marked soft pink, gained a F.C.C., was first in seedling classes at the National Carnation Show, a premier bloom, and was awarded the Charrington Bronze Medal for the best seedling of the year; Dorothy Murray was noticed in my previous article. These and Brunette (A.M. and F.C.C.), heavily edged and marked maroon crimson, are four white-ground Fancies which will be seen at many shows. They are all of the strongest habit, with good stem and calyx. If only Carnations could be grown without supports I feel sure they would find a place in every garden and raisers are certainly realising this.

Two other very charming flowers among white grounds of the strongest constitution are Kate Dew and Freckles; the former may be regarded as a white-ground Sweet Anne Page and it is strongly clove-scented; Freckles is minutely spotted with lavender and should become a favourite.

Yellow-ground Fancies of lovely colouring are Helen of Troy, heavily marked with crimson, and Lady Godiva, edged and splashed with salmon-pink. Both these are perfect for exhibition or border, having form and constitution, while the deep yellow groundwork shows up well.

Bookham Beauty, lavender-grey, striped carmine on an apricot ground, is very fascinating. To all who like the colouring of Kelso or King's Jester (the latter a novelty of last season and a grand border variety), this Fancy will appeal.

Linkman Improved, which promises all the good points of strength, stem and perfect form, with the unique colouring of the old favourite Linkman, should certainly have no trouble in establishing itself, for no other variety is exactly like it, and it is universally seen at exhibitions, despite its drawbacks.

I do not know whether Florence Grisby is being sent out this autumn, but if it is I advise exhibitors to obtain it, as it is a good variety.

Fancies which have come to stay are Albert E. Amos (A.M.), and Fred W. Ransome (F.C.C.), the former is pale old rose, occasionally ticked with scarlet, with a beautiful sheen; it has a very strong stem and calyx, and is perfect in the open border, giving a wonderful amount of layers. Fred W. Ransome is a glistening, deep purple variety, evenly banded with scarlet; it is of the strongest constitution, and will, I think, be greatly admired. Florice, slate-grey, striped with pink, is specially useful for garden purposes, as it is a charming variety of excellent shape and colouring, and should prove an acquisition to its class.

There are some outstanding Selves, St. John being of unique colouring and perfect form. The lovely dead rose shade, unlike that of any other variety, allied to strong habit, will make for popularity. Teviotdale, a strong, ruby-rose, another rare shade, is equally good for any purpose.

Mrs. Paul Vlasto (A.M. and premier, 1926) was, as then shown, a beautiful white Self of exquisite form and great substance. The habit makes it a desirable border plant, and for exhibition it should be perfect.

E. Lyall Swete is remarkable for the size of its scarlet bloom, and strength of stem. It should prove welcome, if only to add to the small number of really good Selves of this colour. Receiving an A.M. this year at Chelsea, it will prove useful to exhibitors, either from under glass or in the open border. A really perfect purple is promised us in Louie Smith, its strong stem, good calyx and general habit making it ideal for exhibition. A great future is predicted for this variety, and good novelties of this colour are wanted. Another Self which, if it justifies its reputation, would be doubly welcome, is

Bookham Apricot; this is strong and good in the open border. Nearly all flowers of this shade are apt to disappoint after the first season, but I hope this variety may be the exception that proves the rule.

Although so much rain has fallen this season, Carnations have bloomed well and given perfect flowers in the open border. I am coming to the conclusion that provided drainage is adequate and particularly on light soil, they really succeed best when watering is done on a more liberal scale than is generally considered necessary with these sun-loving subjects. Not being thirsty by nature, they do not show the effects of drought to the same degree that many plants do, but, on the other hand, they respond very gratefully to, and, indeed, absolutely require, a good watering and overhead spraying after a hot day, and look their best, and give it, when planted in an airy, sunny position, but not one on which the sun scorches with no relief. This, of course, is one of the problems of outdoor cultivation. We cannot tell what weather to expect, and that is why planting in beds in different aspects is advisable, if possible, as the grower then has blooms during a longer period, and also for early or late exhibitions.

Weather conditions in northern districts have been appalling, and on heavy soil, and possibly faulty drainage, losses and "bursting" have been frequent and unavoidable. Pot culture under these circumstances, is being resorted to by many amateurs who have hitherto only grown Carnations in the open border. Drainage is still the first consideration, and I advise beginners to "crock" their pots liberally with varying-sized sherds, on this account. Experienced growers can and do very often place only one large crock in each pot, but they have learnt the exact needs of each variety as regards watering, and thus run no risk from sodden rot conditions—a very frequent cause of failure.

The principal varieties sent out last autumn, such as Mrs. F. W. Seymour, Mrs. J. Fairlie, Lady Bower, Julia B. Wells and Ebor, to mention only a few, have proved perfect open-border plants, the two first-named being somewhat like Mrs. Hawksbee in habit of growth. Julia B. Wells gives plenty of strong layers and is the only Fancy at present of its colour combination. Anyone desiring a good heliotrope Self for border use should try Bindle; for this purpose I do not know a better variety of its shade. J. B. Wells.

TREES AND SHRUBS.

DABOECIA POLIFOLIA.

MANY Ericaceous plants have a reputation for their long season of flowering, but in this respect probably none can equal the Irish or St. Dabeoc's Heath, for its season extends from early summer until well into November. During all this time this dwarf shrub makes a bright and charming display, and it is thus very valuable for planting in quantity in the foreground of shrubberies or in informal groups on sloping banks on the border of woodlands.

The plant thrives in a shady peat soil and is readily increased by cuttings placed under a handlight, and also by layering. The habit of the plant is somewhat straggling if left untouched, and to counteract this it is good practice to cut off all the previous year's growth just before new growth is about to begin in the spring. Under this treatment groups remain effective for a number of years.

The type has flowers of a deep rose colour, but there are several varieties of merit, including alba, pure white; bicolor, white and purple; and atropurpurea, with dark, reddish-purple flowers. A. P. C.

CAESALPINIA GILLIESII.

THIS Leguminous shrub received an Award of Merit when exhibited before the Floral Committee of the Royal Horticultural Society on June 8. The plant submitted was in the form of a small bush in a large pot, rather a poor specimen of this interesting shrub.

During a recent visit to Norfolk, I saw a very

fine specimen of this *Caesalpinia* growing in the gardens of Mrs. Watson Kennedy, of Viveton Hall, Cley-next-Sea. The plant was trained against a wall facing south, and it has occupied that position for about fifteen years; it covers a considerable area of the wall, being about ten feet high and quite as much wide. When seen during early August, it was most attractive with the finely divided leaves and yellow flowers, from which protrude, for a few inches, bright red anthers.

This plant, although looked upon as a tender subject, withstood the severe winter of 1917, when many less tender plants were badly damaged or killed outright in other parts of the garden. There are many sheltered gardens where this plant would succeed, as north Norfolk cannot be regarded as a very mild district. R. Findlay, Wisley.

LONICERA NITIDA.

MR. JOHN BUTLER, of Rose Cottage, Kidlington, sent fruiting sprays of this evergreen Honeysuckle, and wrote: "I thought the enclosed would be interesting. I have never seen it fruit before. The walls of my house are covered with it, south, west and north, and it is growing very freely on all aspects."

Each succeeding year the undoubted merit and beauty of this beautiful Chinese plant becomes more apparent. To-day very many hardy shrub specialists would include it among the dozen most useful Chinese shrubs introduced to our gardens during the present century.

A close-growing evergreen bush, with small, ovate, dark green leaves, one quarter to half-an-inch long, it is very neat and attractive either as a specimen lawn bush, or in the shrubbery border. The small, creamy-white flowers possess a little fragrance, but far more interesting and attractive are the small, globular, shining, opal-blue fruits; hanging thickly on the undersides of the branches, glistening in the late summer and autumn sunshine they are particularly pleasing. The fruits are not seen to the best advantage on bushes until the latter are five feet or six feet in height, but cultivated as Mr. Butler grows them, on walls and fences, the beauty of the fruits is much more apparent.

It is, however, as a shrub for hedges that *Lonicera nitida* seems destined to find its greatest use and value in our gardens. Smaller in leaf and neater in habit than the popular oval-leaved Privet (*Ligustrum ovalifolium*), it forms a pleasing change and relief from this much-planted shrub. It is very readily propagated by cuttings under glass and in the open border; it is fast in growth and seems to withstand close cutting with shears as well and as often as Privet. In the height to which it will grow as a hedge-row shrub, and the ease with which it can be cultivated in most soils, *Lonicera nitida* seems to be on a par with Privet. *L. nitida* is a native of western Szechuan and Yunnan, and was discovered by Mr. E. H. Wilson in 1908, growing at altitudes ranging from 4,500 feet to 7,000 feet. A. O.

THE TREATMENT OF DRY BANKS.

STEEP and comparatively dry banks often exist within the precincts of gardens situated in hilly districts, and such places may be made very attractive, adding greatly to the amenities of the garden. Should the ground slope very steeply, a series of terraces may be made, and these should conform to the surroundings. For instance, if the environment is informal, the paths should also be informal and partake rather of the nature of rude tracks sufficiently wide to allow of comfortable passage. The paths may be formed of stones of irregular shape and size, and the interstices between the stones planted with suitable, low-growing, crevice plants. If retaining walls are necessary they should be of sufficient strength to withstand the pressure of the bank, the weight of which will be considerable; such walls should be constructed of rough-hewn stone, and will be ideal for the reception of many alpine and other plants.

A very different method of treating a steep

bank is to arrange irregular stone steps or paths with occasional stepping stones through it; such treatment is very natural, and is best suited to ground of gentle slope, whereas the dry wall and terrace method lends strength to ground that falls sharply and renders the subsequent management of the bank more comfortable and efficient. For a bank of large dimensions mass planting is best, the resultant effect being always more pleasurable and much more effective than when heterogeneous mixtures of a great number of subjects, many, perhaps, quite unsuited to such a position, are used. In the planting of the treated area the first consideration is the exposure. If it faces other than north or east, a wide choice of shrubs and plants is available, but only such as require a small amount of moisture should be chosen.

The finest shrub for a dry bank is the Broom. Many of the Brooms are suitable, including *Cytissus Andreanus*, *C. pallidus*, *C. Dallimorei*, *C. Dorothy Walpole*, *C. fulgens* and such pretty varieties as *Butterfly*, *Dragonfly*, *Firefly*, *Daisy Hill* and *Mayfly*. In firm soil and a much exposed, windy situation, the ordinary *C. scoparius* is a capital plant, while on the lower terraces may be introduced such dwarf Brooms as *C. schipkaensis*, *C. Andreanus prostratus*, *C. kewensis*, *C. Beanii*, and the small *C. Ardoinii*. A fitting and very lovely companion to the Broom is *Genista virgata*, a fine subject for a dry position.

Corokea virgata is a good bank plant, as are many of the *Cotoneasters*, and I have found many species of *Ceanothus* admirable for the purpose. *Cistus* should be largely planted; a good selection of rock Roses includes the beautiful *C. purpureum*, *C. salvifolius*, *C. obtusifolius*, *C. crispus*, *C. algarvensis*, *C. florentinus*, and the larger growing *C. ladani-ferus* and *C. laurifolius*. In the retaining walls a representative collection of *Helianthemums* will find a congenial home.

Bearded Irises are very beautiful when boldly massed on sharply-sloping banks, and do not, apparently, object to the dry conditions. I have cognisance of a very steep and dry bank facing west where for the last two seasons a very large "drift" of Irises in good variety has been a very fine feature.

Buddleia nanhoensis is a fine subject for a dry position, as also is *Senecio Grayi*, a most effective plant; certain of the *Olearias* will thrive in such surroundings, and *Ericas*, especially the ubiquitous *E. carnea*, should be extensively planted.

For the dry walls and the interstices of the paths, a whole host of small plants are adaptable, and good breadths of *Aubrietia* in choice variety and of *Nepeta Mussinii* should be introduced in close proximity to the stone areas.

The plants available for a north or east exposure are somewhat limited. A massed effect created by a very few subjects is the best solution of the problem; a pretty planting I recently saw on a north bank was a mixture of *Primula denticulata* and yellow and white *Polyanthuses* in spring, interspersed with *Foxgloves* and *Aquilegias* for a later display. The one disadvantage to this selection is the necessity, after the first season, of continually checking the progress of the *Foxgloves*, otherwise they will rapidly crowd out the *Primulas*.

If it is desired to treat wooded slopes or banks, it will be wise to retain a few suitably placed trees; an occasional Pine, for instance, is a great asset. For small banks of gentle contour I would suggest drifts of dwarf Brooms, of *Ericas* or similar plants; bold massings are delightfully effective.

In sheltered localities the terrace walls will provide suitable positions for many choice shrubs, and may be made a feature of absorbing interest; the selection of plants, however, must be largely a matter of individual taste, so that I do not make a lengthy selection, but merely reiterate the advice to plant a large area boldly to procure an appreciable effect.

Autumn is the ideal season to undertake the work of beautifying these dry banks; thorough preparation of the ground will be reflected in the growth made by the shrubs and plants during the next season or so. R. E. A.

PLANTS NEW OR NOTEWORTHY.

DIGITALIS DUBIA.

IN April, 1926, when plant collecting in Majorca, I stayed, among other places, at the stately mountain monastery of Lluch, and there had the good fortune to come upon *Digitalis dubia*. I did not realise my good fortune at the time, for the plant was not then in flower. All I could be sure of was that it was a *Foxglove*, that it was a perennial, and that it was dwarf. The last year's flower spikes were still standing, and were only twelve inches to eighteen inches in height. The seeds, unfortunately, no longer remained. Its perennial habit was vouched for by the clusters of rosettes surrounding the last year's flower spikes, and by the thick, almost woody, stocks of the plants.

this I had little doubt, for Lluch lies high in the mountains and can, on occasion, be terribly cold. Out my precious plants went into various soils and aspects on the rock garden at Stevenage, and to my delight they proved as hardy as I had expected. They came through last winter in the open without protection of any sort, and flowered again freely this year.

I made a second expedition to Majorca this spring, and then made it my business to collect *Digitalis dubia* wherever I found it. It was, however, never very common, and when found not always possible to collect. It grows usually in rocky gorges, sometimes in coarse scree, but quite as often one finds it growing in quite impossible rock crevices from which it is hopeless to try to extract it.

The leaves of this beautiful little plant are narrower than those of *Digitalis purpurea*, the common *Foxglove*, and are rather thickly

FIG. 112.—DIGITALIS DUBIA.

My experience of dwarf perennial *Foxgloves* until then had not extended beyond such comparatively dull things as *Digitalis lutea* and *D. ambigua*, and I remained therefore perfectly calm, on finding this Majorcan species. I took half-a-dozen plants, however, by way of mild speculation, and succeeded not only in establishing them, but in flowering them that same summer. When they flowered I no longer remained calm. *Digitalis dubia* (Fig. 112) proved to be one of the most delightful little plants imaginable. It is a dainty, fairy-like miniature of our own native *Foxglove*, with big wide bells of a charming delicate pink, shading to pure white inside, and richly spotted within with rich crimson. The plant is without doubt the ideal *Foxglove* for the rock garden, and it has an enormous advantage over the common *Foxglove* of being a true perennial. The next thing was to test its hardiness. Of

felted with white wool. It is to be hoped that it will seed in this country and thus enable one to increase the stock so that it may find its way into the gardens of those lovers of alpine who like a good plant. It may, I find, be increased by removing side growths, but this is a comparatively slow business, and once this plant becomes known, rapid increase by seeds will be the only way of coping with its popularity.

Digitalis dubia has not yet found favour in the eyes of the Floral Committee of the R.H.S. Possibly emphatic assurance as to its hardiness is required, for this daintily beautiful plant is almost too good to be true—a delicate pink *Foxglove*, dwarf and perennial. That last, viz., "perennial," is what gives it such a special value, while as to hardiness, it has had a definite test here and has come through it without injury. Clarence Elliott, Stevenage.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the **PUBLISHER, 5, Tavistock Street, Covent Garden, W.C. 2.**

Illustrations.—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Urgent Communications.—If sent by telegraph, these should be addressed "Gard. Chron.," Rand; or by telephone, to Gerrard, 1543.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Letters for Publication as well as specimens of plants for naming, should be addressed to the **EDITORS, 5, Tavistock Street, Covent Garden, London.** Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

Editors and Publisher.—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers.

GLADIOLI FOR SUCCESSION.

MANY lists of flowering dates for Gladioli have been published from time to time in America, during the past twelve or fourteen years, and Mr. Forman T. McLean gave the result of his study of these in *The Flower Grower* for May last. He states that his material came from all parts of the United States, Canada and England. This list includes some six hundred varieties which he divides into five periods. In the few volumes of the *Daffodil Year Book* flowering dates of the Daffodil may be found, but I think the only list of flowering dates of Gladioli to be published in England is the "Flowering Table," by Mr. A. E. Amos, in the *Gladiolus Annual* for this year. Planting dates are given, the first as April 5, and the last as May 3, but the specific varieties planted on any given date are not marked. As those planted in May may flower but a few days after those planted in April, the planting date is important in working out the number of days. I wonder if I should be near the mark if I assumed that Mr. Amos planted Ali on April 5, and Odin on May 3?

Now that a start has been made with flowering dates in England, no doubt more particulars will be given in future lists. In calculating the number of days from planting to flowering, it is important to know the starting date, the soil conditions, and the locality. There is another factor which is also important—all corms reported on should be those of first size. This was clearly brought to my mind as I started writing these notes. On my table was a bowl of Dr. van Fleet; each spike had four fully-open flowers and three prominent buds. This variety is a second-early, as the following flowering dates will show:—4/8/23, 4/8/25, 27/6/26, 27/7/26 and 2/8/27, yet by planting corms of varying sizes I was able to cut my last spikes of this variety just a month after my first spike showed bloom.

In some English catalogues I find an attempt to divide Gladioli into three sections: early, mid-season and late. Mr. McLean divides them into five periods of ten days each. These notes were intended to follow the former division, but on further consideration it seemed desirable to list the varieties in chronological order and cover both systems.

I started with Early Sunrise on July 14. It has been claimed for this variety that it was, and is the first, to bloom, but my records for 1916, 1917, 1918 and 1919 show the flowering dates of this and three others as follows:—

| | 1916 | 1917 | 1918 | 1919 |
|---------------------|---------|---------|---------|---------|
| Early Sunrise ... | July 20 | July 22 | July 21 | July 20 |
| Prince of Wales ... | " 19 | " 22 | " 19 | " 18 |
| Pink Beauty ... | " 5 | " 8 | " 4 | " 7 |
| Halley ... | " 19 | " 18 | " 14 | " 20 |

Some of the Primulinus varieties, such as Hermione, Vanessa and Vinula, may be had in flower in the south as early as the first week in July.

JULY.

14th, Early Sunrise; 15th, Rev. Ewbank; 16th, Altair, Scarletta and Thoth; 17th, Topaz; 18th, Linton; 19th, Gen. de Wet; 20th, Bobolink; 21st, Elberton; 22nd, Revue; 23rd, Elizabeth Tabor and Helen of Troy; 24th, Pansy and Mrs. George Kellner; 25th, Giant Nymph, Lene Gratz, Carrara, Alice Tiplady; 26th, Sheila, Shell Pink; 27th, Margaret Letwas, Sweet Lavender, Canonite, Nydia; 28th, Fire Queen; 29th, Maiden's Blush and Scarlet King; 30th, Arlon, Ada de Poy, Golden Swallow and Priscilla Alden; 31st, Dr. van Fleet, Joe Coleman, Clio, Roanoke and Salmon Beauty.

AUGUST.

1st, Byron L. Smith, Butterboy and Woodcote; 2nd, Antares, Myra and Titian; 3rd, Scarlano and Pansy; 4th, Catherine Coleman and Orange Queen; 5th, Jacoba van Beieren and Odin; 6th, Ali, Nancy Hanks and Red Fire; 7th, Capt. Boynton, Jack London and Ming Toy; 8th, Capella and Rosemary; 9th, Twilight and Jasper; 10th, Priority, Gold Elsie and Sulphur Frills; 11th, King Pearl; 12th, Anna Eberius, Purple Glory and Romance; 13th, Black Pansy; 14th, Scarlet Princeps and Glow; 15th, Lindenow and Virginia Lou; 17th, H. C. Goehl; 18th, Elvira and White Glory; 19th, Princely and Ethelyn; 20th, Scarlet Wonder; 21st, A. B. Kunderd and Muriel; 22nd, Golden Gate and Atlante; 23rd, Gold; 24th, Mrs. F. C. Peters and My Favourite; 25th, Willis E. Fryer; 26th, Red Cloud, Wm. Booth and Helen Wills; 27th, J. A. Carbone; 28th, Louise; 29th, St. Thomas, Heliosa, Pearl of California and Dr. F. E. Bennett; 30th, Gloriana; 31st, Ed. Springer and John Toland.

SEPTEMBER.

In the first week in this month I had Pippin, Lorraine Woerner, Golden Measure, Rubella, Flaming Vale, Lemon King, Lucette already in flower, and one or two others yet to appear, including Quaker Maid and Queen of Somerset.

The above list is a rather formidable one, but individual tastes will quickly shorten it. Most of the varieties will be found in more than one English catalogue. However, apart from the cheaper varieties, I should not be content unless I had some of the following:—

Rev. Ewbank, a light blue; Giant Nymph, pink; Byron L. Smith, which is now too well-known to need any recommendation; Dr. van Fleet, a tall grower with slender stem, an excellent flower for vases; Golden Swallow, a first-class yellow of unusual form, as its name indicates; Nancy Hanks, a flower rather on the coarse side, perhaps, but a grand variety for a bold effect; six or more flowers of rich apricot to orange-pink, with well-marked grenadine tongue, are open at the same time. Captain Boynton is another large flower of recent introduction, white, suffused lavender, with deeper lavender blotch, and popular wherever shown; Twilight, with its creamy-buff colouring and its yellow and delicate pink throat has always been a great favourite of mine, as also is Sulphur Frills, which I prefer to most of the whites.

Romance is another attractive flower of good habit; Black Pansy is a tall grower with a slender stem and needs staking, but its dark red flowers are very striking. Scarlet Princeps is a very bright flower, but is apt to be too dwarf for most people's liking. H. G. Goehl is a blotched

variety at a moderate price. Mrs. F. C. Peters makes a pretty spike just at the end of the month of August, and now that the price has come down to reasonable limits it will certainly be very largely grown. The price of Golden Measure now enables one to buy a dozen for the same money as one had to give for a single bulb a few years back. Flaming Vale produces a fine, tall, strong spike with many deep red flowers open at once.

Turning to the Primulinus group, we have Topaz, a very pleasing flower of salmon colour, but not a tall grower. Revue is comparatively new, tall, with many flowers open; the centre of the flower is a rich yellow flushed with pink on the tips of the petals. Arlon is a richly-coloured flower which always attracts attention. Sheila is classed by some as a large-flowered variety, although of primulinus blood; it is a tall grower with rich salmon flowers; very attractive under artificial light. Priscilla Alden, orange with light yellow blotches, will appeal to most and disappoint no one. Butterboy is a pale yellow variety of straight growth, with neatly-shaped blooms. Pansy is a rich red with darker blotch. Rosemary is not a cheap sort, but it is unlike any other; on a white ground the petals are marked with fine hair-lines and stipplings of lavender-rose, both back and front. Jasper has proved itself a sturdy grower with red flowers having a purple feather over zones of clear yellow. Ming Toy is a large, showy, buff-yellow of good form. Elvira is a nearly white form of good habit. Prim Queen is a fine orange-yellow, producing a good spike. Copperhead is very like the last-named, in fact, as grown side by side no difference could be detected. Rubella is rich velvet-purple, with a small ruby spot on the lower petals, an attractive flower in this colour.

Having made out my order for the above and money still being available, I should be tempted to include some of the following:—Panther, a distinct acquisition to the fancy class; Lady Ada Fitzwilliam, a free-flowering Langprim variety; Pearl of California, a beautiful, full spike of pink; John Toland, peach-red, shading lighter to the centre and with a prominent ox-blood blotch on the lower petals; Gold Eagle, a very fine yellow and tall grower; Heliosa, another good yellow but dwarfier than the preceding variety; Jap, also a fine clear yellow; Phaenomen, a flower of very delicate and refined colouring, and Splendorra, a tall, purple variety.

I could go on almost indefinitely. Many other varieties might be mentioned, but I think the lists are long enough for the readers of *The Gardeners' Chronicle*. I have also in mind that a trial of this particular flower has been made at Wisley this year, and I have no doubt the report of this will be in the hands of readers before next planting season. In that report mention will, no doubt, be made of other varieties and, following the usual custom, we shall have full information both as to planting and flowering dates. *Sussex.*

GARDEN NOTES FROM SOUTH-WEST SCOTLAND.

MR. ARNOTT's note on *Allium sphaerocephalum* (page 186) ought to remind one of an interesting genus of Monocotyledons which deserves more attention from amateurs than it usually receives. It is true that, among the eighty species enumerated in the *Kew Hand List* the majority are of no more than botanical interest; but there are others which always receive favourable notice from visitors. *A. sphaerocephalum*, flowering in July and August is one of these, and is followed by *A. paniculatum*, which carries handsome, conical trusses of pendulous crimson flowers on stiff stems two feet tall. Next in succession comes *A. Beesianum*, forming dense clumps which are crowded in September with corymbs of good blue flowers, the twelve-inch stems being bent at the top so that each head droops gracefully. *A. Bulleyanum* is hardly worthy of bearing the name of one who has done so much for horticulture, nevertheless, its flowers, each with a bright green

WATER GARDEN AND LILY POOL AT GLASNEVIN.

ovary within a claret-coloured perianth, borne on long, slender pedicels in a spherical head, offer a modest display on a sunny morning, and provide irresistible attraction for wasps. In late spring *A. subhirsutum* justifies admission to a mixed border by a profusion of corymbs of white blossom.

In the genus *Inula* there is no species, methinks, equal to the Himalayan *I. Royleana* for vigorous beauty, yet the only praise which I can remember seeing bestowed upon it is in Mr. Robinson's *Flora and Sylva*, Vol. I, page 310, where there is a fine coloured plate from a drawing of the flower by the late Mr. Moon. July must be half-spiced before this plant rears its rich orange discs, four or five inches across, on sturdy stems about two feet high without the slightest tendency to flop. Its colour contrasts well with that of *Anchusa italica* var. *Dropmore*. I am indebted to the late Mr. Irwin Lynch, who presided so effectively over the Cambridge Botanic Garden for many

a fine show against a wall, but it is not in every garden that wall space can be found for it.

The Spanish Broom—*Spartium junceum*—is another disappointing shrub in our humid west. It flowers, indeed, for two or three years, but its life is short; whereas the Madeira Broom—*Genista virgata*, and the Etna Broom *G. aetnensis*—both natives of sunny climes, thrive vigorously, never fail to flower profusely, and attain a great age. It may save Scottish gardeners some disappointment if the climatic peculiarities of these species are borne in mind. *Herbert Maxwell, Monreith.*

NOTES FROM KEW.

It is interesting to record some of the many trees and shrubs which have made abundant growth and leafage during July and August,

distance from the parent, and provide a ready means of increase.

Few shrubs have a longer and more useful flowering season than *Hydrangea paniculata*. For about two months, during August, September and into October, the large, pyramidal panicles of white blossoms are conspicuously attractive at the ends of vigorous, leafy, young growths—the result of hard pruning in April, thinning the young shoots about six weeks or two months later, and applying a liberal mulch of decayed manure early in June.

The shrubby Mallows, varieties of *Hibiscus syriacus*, have flowered surprisingly freely and continuously this autumn. We usually associate their greatest beauty with a warm, sunny August and September, which is certainly not the case this year. We must probably look to the dry, sunny days of May and early June, which ripened and commenced the formation of the flower buds in the side growths, for the freedom of flowering this autumn.

FIG. 113.—ORCHIS FOLIOSA AT KEW.

(see p. 244.)

years, for another attractive Composite, to wit, *Helianthus mollis*, which opens its golden blossoms in latest summer and has none of the coarseness which mars the effect of some of its kin. It grows some five feet high and has pleasing, velvety foliage.

There are several desirable shrubs which, although quite hardy on the western seaboard, require more continuous and hotter sunshine than they find here to enable them to do themselves justice. Among those which we have reluctantly decided are not worth growing are *Clerodendron trichotomum* and *C. foetidum*. Neither of these flower here in September, and it is only about one year in five that they make the fine display which one admires on the south coast. In the same category must be reckoned *Xanthoceras sorbifolia*, which flowers, indeed, and sometimes ripens its huge capsules; but the panicles are stunted and poor compared with those produced in the southern counties. No doubt it might make

despite a poor start in April and May. Frosts first crippled or destroyed many young growths and flower buds; following this, we experienced six weeks of dry weather, when choice shrubs in particular, made comparatively little new growth. We have now had some three months of abnormally wet and dull weather for the time of year; nevertheless, there should be abundant blossom on trees and shrubs next year if sufficient sun and dry weather are experienced to ripen the growths before sharp frosts occur to cripple sappy, unripened twigs.

In shrubby beds and borders the Chinese Angelica Tree, *Aralia chinensis*, is strikingly effective, with large, double-pinnate leaves up to three feet or more in length, and huge panicles, thickly studded with small, white blossoms. Though sometimes represented by a small, spreading tree, it is more often seen as a large bush, with many sucker growths, clothed with large spines; these come up freely around established specimens, often at some

Both single and double sorts are attractive. Four single varieties stand out as particularly showy: Hamabo, blush-white, with a showy crimson base; Coeleste, light purplish-blue; Rubis, ruby-red, and Totus albus, pure white.

The Sorrel Tree, *Oxydendrum arboreum* of botanic gardens, and *Andromeda arborea* of some nurseries, is a very distinct small tree. It belongs to the Natural Order Ericaceae, and is deciduous, with fan-like sprays of white Erica-like blossoms borne at the ends of the shoots in August and September. A little later the tree is also an object of beauty, the leaves changing to rich red and golden-yellow before falling. *Clethra tomentosa* is another Ericaceous plant, flowering in early autumn. A bush up to five feet or more in height, it thrives in association with *Rhododendrons*. The white flowers are more showy than those of the Common Sweet Pepper-bush, *C. alnifolia*, and it is also valuable because it flowers a month later.

It is rather early to draw attention to autumn

tints, for although the beautiful vines, *Vitis inconstans* (syn. *Ampelopsis Veitchii*) and *V. Coignetiae* are already conspicuously bright on buildings and trees, most trees and shrubs are still a rich green. A striking exception is the American Tupelo, *Nyssa sylvatica*, always among the first to assume a glorious autumnal colouring of shining red and yellow.

Among autumn-flowering Heaths, none surpass the Cornish Heath, *Erica vagans*, and its several varieties, for extensive planting and massing on sunny slopes and undulating ground. Normally one foot to eighteen inches high, there are masses in several places at Kew which have grown double this height, and at the present time are covered with spikes of blossoms. In addition to the pinkish-purple flowers of the type, the larger-flowered variety *grandiflora*; the variety *alba*, with white flowers; the rosy-red variety *rubra*; and, best of all, var. *kevernense*—the St. Keverne Heath—are all deserving of attention in the formal garden and pleasure grounds where Heather and Ling thrive.

Flowers are to be found for six months out of twelve on the St. Dabeoc's Heath, *Daboecia polifolia*, and its several varieties. For most of this period the plants are freely clothed with the richly-coloured blossoms on spreading, bushy plants eighteen inches to thirty inches high. The variety *atropurpurea*, with rich, purple-red flowers and dark red, tinted foliage, is particularly effective against the rich green foliage and white blossoms of the variety *alba*. The variety *bicolor*, with purple and white flowers, is distinct and pretty when dotted among the rosy-purple flowers of the type.

By the lake-side, on the slightly sloping bank, large beds of the Torch Lily, *Kniphofia Uvaria*, are most effective both reflected in the water when seen from across the lake, and in the distance, down the Sion vista. Another very attractive feature just now at the north end of the lake is a large area of single China Asters, *Callistephus hortensis*. The seeds were sown on ground which was dug over in spring, after stripping it of turf to use for the repair of lawns in various parts of the gardens. A. O.

NOTES FROM WISLEY.

A COMPREHENSIVE collection of Fuchsias is now to be seen at Wisley in one of the greenhouses near the Laboratory, and varieties making a good show include Mrs. Rundle, Mauve Beauty and Phenomenal, with huge blooms of scarlet and rich purple. A more dainty subject is *Fuchsia gracilis*, of which a pretty, variegated form is in flower, while something of a curiosity, though by no means unattractive, is *F. procumbens*. The latter is a trailing plant with slender, much-branched stems, which bear axillary flowers having a short, orange corolla-tube and reflexing, greenish-purple lobes. It is a useful subject for planting in baskets and produces bright berries.

Ornamental foliage is provided by Fuchsias, such as A. A. Henkel, in which the underside of the leaves is bright crimson; and also by Sunray and Golden Treasure, with golden foliage sometimes tinged with pink.

In addition to Fuchsias, plants in flower under glass include Nerines, of which the brilliant red *Fothergillii* major and Prince of Orange are among the first to bloom. In the same house is to be found in bloom plants of the yellow-flowered, Portuguese Sundew, *Drosophyllum lusitanicum*. Its long, linear leaves are provided with sticky hairs which trap small flies, but, unlike our British *Drosera*, the hairs are rigid and have not the power of closing upon their victims. Another remarkable feature of this plant is that the leaves are revolute in bud and not involute.

In the large vinery there is an exceptionally heavy crop of Grapes this year. It contains forty distinct varieties which are nearly all grown on the single-stem system and are from fourteen to sixteen years old. Muscats, such as Cannon Hall and Muscat of Alexandria have been remarkably good. Several bunches weighing 5 lbs. to 6 lbs. have been taken from Syrian, while Golden Champion, with its extremely large,

oval berries has been nearly as fruitful. Among the black-berried varieties particularly good yields have been obtained from Madresfield Court, Appley Towers and Barbarossa. A curiosity is Carnichon Blanc with pointed berries; while another peculiar variety is the Strawberry Grape, of which cuttings were sent to Wisley by the Rt. Hon. Lord Lambourne. It is not easy to grow well, and the fruits are small, but they have a flavour resembling that of the wild Strawberry, and when ripe are extremely sweet.

In the alpine house, *Ceratostigma plantagineum*, which looks rather like a miniature Funkia, and *Selliera radicans*, a little plant with white or pale lilac flowers, which grows on rocks and salt marshes in New Zealand, are in bloom. *Grevillea alpina* is in flower; this comes from South Australia, and has red flowers similar to those of the much larger *Grevillea thyrsoidea*. In addition to the foregoing, *Eomecon chionantha*, a white-flowered Chinese Poppy, is interesting, as also is *Sempervivella alba*, which grows on the mountains around Simla. It bears a strong superficial resemblance to a *Sempervivum*, and has pure white flowers with a greenish centre, and flat, fleshy leaves which often turn bright red.

The rock garden is rather dull at the present time, save for a bright splash made by the red flowers of *Schizostylis coccinea* below a shrub of *Euonymus latifolius*; their blooms very nearly match the colour of the pendulous fruits of this Spindle Tree. Of frequent occurrence in the rock garden are self-sown seedlings of *Gentiana asclepiadea*, with its white variety *alba*. Considerable variation in colour is noticeable in the case of the blue forms, which vary from purplish and pale blue to true Gentian blue. This plant is seen in still larger numbers in the wild garden. A few may also be found in the Heath Garden where, in company with Harebells, they mingle pleasantly with the Heather.

Numerous varieties of Heaths are now in full bloom, and in addition to the common Heather, of which there are some very large individual plants, patches of the rich, pink-flowered *Calluna vulgaris* *Alportii* are conspicuous. One of the best of the white Heathers is *Calluna vulgaris* var. *Serlei*, with long spikes of flower and bright green foliage. Another white-flowered form, *C. vulgaris pilosa*, carries a slight down on its leaves, which gives it a grey appearance that is all the more apparent when it is contrasted with *Calluna Serlei*.

Erica ciliaris and *E. vagans* are in bloom and, as usual, flowers are to be seen on that wonderfully persistent bloomer, *Daboecia polifolia*.

Among the larger shrubs, *Magnolia grandiflora*, with its huge, scented, creamy blossoms and Laurel-like foliage, is now in flower, and elegant panicles of white blooms are displayed by *Escallonia montevidensis*. Strongly-scented blossom is a feature of *Clerodendron trichotomum*, and also of *Clerodendron foetidum*, with rose-coloured flowers, the scent of which, however, is not nearly so unpleasant as the specific name would lead one to believe.

In the Field Garden, *Potentilla fruticosa* and *Hypericum galioides*, both with yellow flowers, are in bloom. The latter forms a low, round bush, and is well worth growing on account of its handsome foliage. One of the happiest combinations in the Field Garden is that of *Buddleia variabilis*, with its mauve flowers backed by the dark purple foliage of *Prunus purpurea* *Woodii*, while other attractive objects in this part of the gardens include a tree of John Downie Crab loaded with fruits, and numbers of handsome, coral-berried *Berberis*, such as *B. sibirica* and *B. Regeliana*.

Remarkable growth has been made by many of the shrubs planted against the wall of the Laboratory, one of the most conspicuous in this respect being *Acacia dealbata*. It passed safely through last winter and its feathery, glaucous foliage is now carried to a height of nearly twelve feet. In close proximity is a plant of *Billardiera longiflora*, a slender climber of doubtful hardness, which is now covered with bright violet berries and is most decorative; the little, greenish-white, tubular blossoms which appear in early summer resemble those of a *Lapageria*. Another ornamental wall plant

is *Abutilon megapotamicum* (syn. *vexillarium*), with its brightly variegated foliage. The pendulous blossoms have an inflated calyx of bright crimson from which the primrose petals protrude. It grows near the banks of the Rio Grande. Some attractive *Clematis* are in flower both on the walls of the Laboratory and the Garden-keeper's house. Among them are *Clematis glauca* and *C. alabioides*, with yellow flowers, and the blue-flowered *C. integrifolia*. Another handsome climber in flower on the Laboratory is *Passiflora coerulea* var. *Constance Elliott*, with cream-coloured blossoms.

The effect of the flowers in the herbaceous and mixed borders has been somewhat spoiled by the rain. Even so, many bright patches are still to be seen, as, for instance, a corner confined entirely to red-flowered plants, which include *Salvia Harbinger*, *S. Grahamii* and other red-flowered *Salvias*, *Pentstemon isophyllus*, *Lychnis chalcidonica*, *Hedysarum coronarium* (French Honeysuckle), *Monarda didyma* and Scarlet *Lobelias*. J. E. Grant White.

RARE GARDEN WORMS.

III.—THE MOTTLED WORM.

As this species (*Allolobophora ictérica*) has hitherto been found only twice in this country it certainly merits a place among our rarest forms. It was first described by Savigny in 1826. It was then practically lost to sight for sixty years, when it was rediscovered in Northern Italy and Switzerland, and brought into prominence by Dr. Rosa, then of Turin. Dr. Ribaucourt, ten years later (1896) reported it as occurring near Paris, and after the lapse of a further decade, I discovered it in the Botanic Garden at Cambridge. After four more years it was found in Chelsea,* and since that time it has never again been seen. There was an element of doubt respecting the identity of these various finds on account of some differences of structure, but this was set right in 1896 by de Ribaucourt, and we may for the present regard the species as a European one, its occurrence in this country being, in all probability, accidental. Strangely enough, it seems never yet to have occurred at Kew, where so many introduced species have been found, but if careful collections were made here and in other gardens which have received plants from the Continent it ought to be rediscovered. In order to aid collectors in recognising it, the following notes may be of service.

The Mottled Worm is so named on account of its characteristic colour. This has never been carefully recorded. Ribaucourt, who found it fairly well distributed in Switzerland, merely says: *La couleur est grisâtre*; while Dr. Michaelsen, who, apparently, had not seen it alive, states it is "*schwach gelblich*." Beddard does not mention the colour at all. Years ago I made coloured drawings, black and white sketches, and full notes on the living subjects, both in relation to the Cambridge forms and those found at Chelsea. The anterior segments which form the head are flesh-coloured (Fig. 114). A bright yellow patch is often found dorsally midway between the head and the girdle above the male pores. The girdle is usually yellowish, followed by a purple patch, the rest of the worm being a curious mixture of purple and gold. Sometimes these two colours alternate so regularly that they have a decided chequer or chess-board appearance (Fig. 115), and even when the marking is not so uniform, it is very characteristic in its mottled appearance. In one respect it recalls the Brandling, for when irritated or placed in alcohol it emits an enormous quantity of yellow fluid, doubtless a device for protecting it against its foes, like the ink of the cuttle-fish or the explosion of a bombardier beetle. As there is no other worm with which it could be confused, unless it is the sluggish Green Worm (*Allolobophora chlorotica*) the colour scheme is of great interest and value. Rosa alludes to the fluid in the following note on the Italian forms. "Colour pallid, with

* See *The Gardeners' Chronicle*, Dec. 23, 1905, p. 434, and October 23, 1909.

a yellowish tinge, owing to the coloured liquid within showing through." One other point serves to guide the student if he has to deal with preserved specimens instead of living material, and that is the tendency of the worm to remain almost straight instead of curling up into a ring when placed in alcohol.

I have already more than once pointed out how desirable it is that we should possess accurate delineations of each of the species of worms found in our gardens, first in their living state, and then as they appear when allowed to settle down as spirits are poured over them.

FIG. 114.—ALLOLOBOPHORA ICTERICA.

Colour scheme of an ordinary specimen found at Chelsea.

The muscles differ with the life habits, and something might be learned about the different species by observations such as these.

Collectors may, however, be glad of a description of the Mottled Worm as we may expect to find it in old gardens. Average adult specimens are about three inches (6.8 cm.) in length, and 4.5 mm. in diameter. The number of segments ranges from 140 to 190, those behind the girdle being very narrow. Ribaucourt states that the form of this worm is "*tres gracieuse*," and cylindrical. Attention is also called by him to the tendency of the diameter to diminish in the neighbourhood of the male

Worm (*Eisenia rosea*) on the girdle of the adult; but while the worm is still young and the girdle is in process of formation, they may readily be observed, as both Ribaucourt and I have recorded. The first dorsal pore usually occurs between the sixth and seventh segments, and it is from these that the yellow fluid is secreted. Among the many specimens collected by Ribaucourt in Switzerland, amounting in all to forty, there were many variations, especially in regard to the girdle, but in other respects they were so uniform that no distinct varieties could be founded on these anomalies.

ripening. Bush fruits were good, excepting Black Currants. Gooseberries were plentiful and Raspberries very good. Our soil is loam on clay with some parts gravelly. *Geo. H. Hill, Caldecote Gardens, Bushey Heath, Watford.*

—The fruit crops in this district are variable. Owing to the severe frosts we experienced at the end of April and early May (17° on May 1), the fruit trees in low-lying parts suffered severely, more particularly standard Plums and Damsons; also Strawberries, Peaches and Nectarines. Nearly all kinds of fruit trees flowered abundantly. The trees are healthy generally and clean, making good growth. *Edwin Beckett, Aldenham House Gardens, Elstree.*

—Our soil is heavy loam, and the position is high. Bush fruits, such as Gooseberries, Red Currants, Raspberries and Black Currants were very good; the trees are very clean and free from caterpillars and aphids. I sprayed in winter with Carbo-Crimp winter wash and good results have been noticeable not only on bush fruits, but Peaches and Nectarines inside, also orchard trees of Plums, Apples and Pears. Moss, lichen, scale and American blight have been reduced and the trees are making excellent growth. *W. Stephenson, Hyde Hall Gardens, Sawbridgeworth.*

—The late frost experienced here in May when most of the Apples were in bloom has done little harm to some of the varieties. On the whole, the crops are good, with the exception of Apples Bramley's Seedling, Peasgood's Nonesuch, Mère de Ménage and Rev. W. Wilks. Pears on walls are very good, whilst those grown in bush form near the paths are a complete failure. Peaches are a fair crop, while Plums are a light crop even on walls, those growing on standards having failed to produce a single fruit. The same may be said of Damsons. The only variety of Plums that required thinning was Denniston's Superb. Gooseberries, Cherries, Raspberries and Currants were very good, but Strawberries were much below the average crop. *T. Pateman, Bocket Hall Gardens, Hatfield.*

—Once again, another year opening with good promises of fruit has led to many disappointments. Late frosts and continued low temperature have sadly depleted the Plum, Cherry and Apple crops. Much may have been saved where the use of coverings were adopted. Although Strawberry plants were far from their usual vigour, a moderate crop was saved, and bush fruits yielded heavily. The Raspberry crop was somewhat reduced by the frosts which destroyed the earlier flowers; the variety Lloyd George had a fair crop. Peaches and Nectarines set well but fell freely later. The following varieties appear to have suffered most from the effects of frost. Peaches: Alexandra Noblesse and Hale's Early; Plums: Blue Rock and Denniston's Superb; Apples: Cox's Orange Pippin, Bramley's Seedling (particularly so) and Tower of Glammis; and most varieties of Cherries bore reduced crops. It may be owing to the aspect of the gardens that the crops were at least a week later than in some districts. The soil varies from a sandy nature to a clay, but, as a whole, it may be described as a heavy one. *A. J. Hartless, King's Walden Bury Gardens, Hitchin.*

LEICESTERSHIRE.—Apple blossoms suffered from the late May frosts, and Strawberries also suffered from the same cause. The Plum crop was also reduced by the cold spring. *A. H. Campin, Whetstone Pastures Gardens.*

—Without a doubt we have to thank the severe frost at the end of April for the light fruit crops this season, there being till then every prospect of a good fruit season. Plums flowered exceptionally well and the fruits set freely, but the frost of April 29-30 destroyed practically every one. In these gardens we registered 12° of frost. It is interesting to note how hardy some varieties have proved to be, Apple Irish Peach is carrying good crops in spite of the frost, also Cox's Orange Pippin; Pear Fertility is also carrying a heavy crop, with the variety

FIG. 115.—ALLOLOBOPHORA ICTERICA.

Section showing chess-board pattern, alternately purple and yellow; enlarged from a Chelsea specimen.

pores where the papillae, though recognisable, are not conspicuous. There is considerable difference in the descriptions of the girdle. Savigny, who wrote the original description, states that it extends over segments 35 to 44. Dugès examined Savigny's material and found variations, some specimens showing the girdle from 33 to 44. Rosa gives fuller details, and he finds the girdle on 33 or 34 to 42, 43, or 44. Such variations are constantly met with among the Allobophoras, which have not, like Lumbricus, attained stability. There is a similar uncertainty respecting the segments on which the tubercula pubertatis are found. Savigny, Dugès and Ribaucourt name 36 to 44, Rosa says 35 to 41 or 42; in the Cambridge and Chelsea specimens the girdle segments were 33, 34, to 44, and those of the tubercula 36 to 42, 43 or 44. When we remember how variable the Venetian Worm is (*Gard. Chron.*, July 2, 1927, p. 12) we shall not be surprised at these mutations. The dorsal pores are not seen, as in the Rosy

If worms answering to this description, or any others which are in any way unusual or rare are sent to the writer in tin boxes packed lightly with moss they will be carefully examined and reported on if of any interest. In gardens of long standing, and especially in those which have been stocked with plants from abroad, there must yet be many forms which have not had attention; and such species or varieties may be useful for purposes of biology, if duly recorded and described. The address is given below. *Hilderic Friend, Cathay, Solihull.*

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, Ante pp. 131-137).
(Continued from p. 234).

MIDLAND COUNTIES.

HERTFORDSHIRE.—The fruit crops this year are good, considering the frost we experienced while the trees were in blossom. Early-flowering Apples suffered, the variety Rev. W. Wilks being the worst. Peaches and Apricots dropped all their fruits after setting good crops. Small fruits, such as Raspberries, Black Currants, Red Currants and Gooseberries yielded heavy crops. Our soil is a heavy, cold clay, and in a dry spring trees suffer.—*Richard Staward, Ware Park Gardens, Ware.*

—The Apple crop here is a very good one. The best-cropped dessert varieties are Ribston Pippin, Claygate Pearmain, Worcester Pearmain, Allington Pippin and King Pippin. Other kinds bearing large crops are Lane's Prince Albert, Cox's Pomona, Lord Suffield, Keswick Codlin and Court of Wick. We have very few Cox's Orange Pippin as this variety suffered from April and early May frosts and cutting from north and east winds which prevailed. Peaches and Nectarines also suffered from the same cause and but little fruit was left on the trees. We have scarcely any wall fruits beyond Pears and Cherries, and very few Plums, excepting Victorias. Strawberries were half-a-crop and much of the fruits were spoiled by the wet weather when

Conference a good second. *M. L. Garrett, Misterton Hall Gardens, Lutterworth.*

The fruit crops here are well under the average this year owing to the disastrous frosts during the last few days of April; up to that date we had every prospect of a good fruit year. The Apples were caught in blossom, and Pears suffered considerably, although nicely set; trees having the protection of walls are carrying fair crops. Small fruits did not suffer so much, except Strawberries, all the early bloom and some not then open being spoilt. Ours is a heavy soil. *David Thompson, Whaddon Gardens, Loughborough.*

—After a very trying spring, with late frosts, we all thought that there was no prospect of a good crop of fruits, but up to the present (July 26), Apples promise to be a good crop on some trees, Pears a fair crop and small fruits good. Plums are a very light crop. A great many Apples are dropping owing to late frosts preventing proper fertilisation. At Easter the prospect was for heavy crops all round. Raspberries were a good crop and Strawberries fair. Our soil varies from medium to heavy clay. *W. Coe, Prestwold Gardens, Loughborough.*

(To be continued).

FRUIT GARDEN.

PLUMS ON WALLS.

NOT for a number of years have we had such fine crops of good, clean Plums on wall trees with a north-west aspect. The best varieties were Kirke's, the finest Plum for all purposes, and a sort which never fails to crop; Early Rivers', which is equally fruitful; Early Transparent, Belgian Purple, Magnum Bonum, Count Althann's Gage and Late Transparent Gage. Three trees of Coe's Golden Drop are bearing splendid crops, although up to this season they had never given more than a half crop. On walls with a south-east aspect, trees of Kirke's, Early Rivers', Golden Gage and Victoria have produced splendid crops. We have also a good yield of Coe's Violet, Jefferson's, Washington, Magnum Bonum, The Primate and President. The last two are our best late varieties and furnish splendid fruits. On standard trees, the crop was very thin; many of the fruits rotted through the excessive rains, and birds and wasps also did much damage. The small blue tit is the most destructive bird we have to deal with here in the fruit garden. *A. B. Wadds, Englefield, Reading.*

THE MULBERRY.

THE Mulberry is of considerable decorative value, a tree rich in romance and tradition. The Black Mulberry, *Morus nigra*, is the best species, and perhaps the only one worthy of cultivation in Britain. There are some exceedingly fine specimens of the tree in this country, some of great age. Even in winter the bare, greyish-brown, somewhat twisted branches, and the gnarled stem present a picturesque effect, and in summer the dense mantle of large and rich green leaves renders the Mulberry a tree worthy of being planted in prominent positions.

M. nigra is reputed to be a native of Persia, to have been introduced into Europe by the Greeks, and the Romans are said to have betrayed a great partiality for the fruit; it was introduced into England in 1548, and the first trees were planted at Sion House, Brentford. The inconspicuous flowers are greenish white, unisexual and produced in axillary, catkin-like racemes. The fruits ripen from the middle of August to the end of October, and where a tree is suitably placed, as on a lawn, the berries are best allowed to fall and be collected from the turf; they are rarely used for dessert, being too sharp for the majority of palates, but are greatly favoured when used in tarts or puddings, and are suitable for making jam and jelly. A tolerably good wine may be made from the fruits.

The white Mulberry, *M. alba*, is grown for its leaves, which are used for feeding silk worms. The tree succeeds in any ordinary good, loamy soil, and, except in the far north, may be grown as a standard in exposed situations; in cold districts Mulberries should be afforded the protection of a south or south-west wall. Methods of propagation are many, such as by cuttings, layering, budding on seedling stocks, or inarching; seeds germinate satisfactorily, but seedlings are long in reaching the fruiting stage and often prove sterile.

Wherever old Mulberries exist they should be cherished, as few trees are more picturesque, even though supported by chains and stakes. A magnificent old specimen exists on the lawn of Cirencester Abbey, and near to it is one of the oldest and largest Tulip Trees (*Liriodendron Tulipifera*) in England—two beautiful and interesting old specimens. *Ralph E. Arnold.*

VEGETABLE GARDEN.

THE SOWING OF PEAS.

I HAVE completed the records of an interesting experiment in the cultivation of Peas, the object being to test the practical value of thin *versus* thick sowing. The soil is admirably adapted to the cultivation of vegetable crops; it was double-dug and enriched with good farmyard manure last winter, at the rate of twenty-four tons per acre. Immediately before sowing the seeds, superphosphate, thirty per cent., was scattered in the seed-drills at the rate of half-an-ounce per lineal yard.

The varieties Little Marvel and Rentpayer were included in the experiment because I was anxious to see the effect of thin and thick sowing on dwarf and tall varieties respectively. Four rows of each variety were grown, and the seeds were spaced as follows: First row, two inches apart and four rows of seeds in the drill; second row, three inches apart and three rows in the drill; third row, four inches apart and two rows in the drill; in the fourth row the seeds were scattered thickly from the seed packet in what I think might be called the old-fashioned way.

The returns from a twelve feet stretch of drill in each instance are as follow:—

| Variety. | Seeds 2 inches apart. | Seeds 3 inches apart. | Seeds 4 inches apart. | Seeds sown thickly. |
|-------------------|-----------------------------|-----------------------------|-----------------------------|---------------------------|
| | lb. oz. | lb. oz. | lb. oz. | lb. oz. |
| Little Marvel ... | 6 0 | 7 9 | 8 5 | 5 6 |
| Rentpayer ... | 9 1 | 11 0 | 13 3 | 8 1 |

The result of the experiment makes an eloquent appeal for thin sowing, with its attendant advantages of more light and air and possibly a more regular supply of the elements of nutrition. It should be stated that the greater the distance apart the more vigorous was the haulm, the larger the pod and the better the filling capacity. *Geo. H. Copley, N.D.H.*

THE POTATO CROP.

POTATOS planted during March in a rich, sandy loam, yielded a good crop of clean tubers. A portion of the land received a heavy dressing of shoddy in the previous season and the crops were much heavier where this had been applied.

Duke of York, grown from Scotch seed, produced large crops and the tubers were clean and of good shape. The same variety grown from home-saved sets also yielded a large crop, but the tubers were inferior, both in shape and quality. First Crop is a splendid yellow-fleshed kidney variety. The haulm is compact, the tubers a beautiful shape, and the crop comes to maturity very early. This variety is suitable for forcing in pots or frames.

Snowdrop, or Witch Hill, is a white Kidney Potato of flattish shape with very shallow eyes. The tubers are very floury and of excellent flavour when cooked; this variety is very

useful for early exhibitions. Carisbrook Castle is a special favourite of mine; the yield from home-saved sets of this variety was excellent. The flavour of this Potato is such that it is preferred to any other early variety.

Amongst second-early varieties, Royalty was very good; the tubers are oval and the flesh white; the haulm is of medium strength. This Potato is a heavy cropper. Ben Lomond is a heavy-cropping, mid-season variety producing large, shapely tubers. In many districts the flavour of this variety is excellent. Flourball is a reliable red-skinned Potato, much appreciated for its disease-resisting qualities. Long-Keeper is an oval-shaped Potato with pale yellow flesh; it has proved to be a splendid variety for late use in various localities, and has been grown most satisfactorily alike on heavy, medium and light soils. The new Glasgow Favourite is remarkable for its heavy cropping, robust constitution, and fine cooking qualities. The tubers are of oval shape with shallow eyes; it is an excellent white-fleshed, maincrop variety. *Colin Ruse.*

HOME CORRESPONDENCE.

[The Editors do not hold themselves responsible for the opinions expressed by correspondents.]

Frost and Insects.—There was a considerable amount of correspondence on this subject—in which I took a minor part—in *The Gardeners' Chronicle* during the months of March and April, 1926. I was rather surprised by the statement of, I believe, Mr. Nicholson, that a large number of insect larvae, having been frozen into a solid block of ice and kept so for a certain time had, on the thawing of the ice, been found to be very much alive. Although I cannot explain away this statement, I would like to draw attention to the results of my own study of and practical experience in the subject during the last winter, 1926-1927, on the Continent. Selecting the wireworm for a subject, I dug up, in open, frozen ground, twenty wireworms frozen stiff and apparently dead. On being placed in the warmth, eight showed sign of life, but the remainder were, beyond all doubt, dead. A few days later, during a thaw, I had occasion to lift a large quantity of turf. In the turf were several patches of the wild Cerastium, a weed which forms a carpet of fine foliage so dense that I have known it to prevent effectually 10° of frost from penetrating to the soil under the patches formed. On lifting the clean turf I, and the men working with me, noted that no wireworms were to be seen, but that on lifting the wild Cerastium (and in every case) two or more wireworms were found, and all alive. This appears to show conclusively that the wireworms seek the protection of rank-growing weeds not only as a food supply but also as a source of warmth during hard weather. Furthermore, we examined the ground under deciduous hedges at the same time and, where the thickest carpet of leaves had lain, found wireworms. I contend that in each of the above instances the wireworms were seeking warmth. If not, what were they seeking? It is a well-known fact that rubbish generates heat, and that this heat gives protection to garden pests during the winter months. Do away with rubbish and weeds in the garden and there will be less protection against frost for the pests. Finally, I would recommend all sceptics to read the fine article on "The Prevention of Insect Attacks in the Garden," by Mr. G. Fox Wilson, which appeared in the *Journal* of the R.H.S., August, 1927. In this article Mr. Wilson clearly points out the folly of neglecting weeds and rubbish which afford shelter to garden pests during the winter. *H. J. Phillips.*

Fruits of *Prunus Pissardii*.—I read with interest, in your issue of August 27, Mr. J. Kitt's note on *Prunus Pissardii* fruiting this summer in Wasing Place Gardens, near Reading. I, too, have seen this tree fruiting so recently as last

month in a garden in Colchester. There were only one or two fruits on the tree, which is about twelve to fifteen years old, and they were exactly as Mr. Kitt describes them, not quite so dark in colour as the foliage of the tree, and the size of a good Damson. I have previously heard of this tree fruiting, but until this year had never seen it in bearing. *A. Donald Blavill.*

The Golden Elder.—At present (middle of August) the Golden Elder is in full flower in this part of the country, five to six weeks later than the common Elder. Its Cauliflower-shaped heads are in marked contrast to the flat, somewhat concave inflorescences of the common Elder, and this character alone is, I think, sufficient to distinguish it from the latter species. *A. D. Richardson, Edinburgh.*

Golf Greens.—In the articles which have appeared on this subject, nothing has been said about other than nitrogenous fertilisers. Possibly it is presumed by the writers that those in charge know that no plant will thrive without something besides nitrogen. There may be, at the time of starting, sufficient of other plant foods in the soil to keep the weeds and grass

SOCIETIES.

YPRES HORTICULTURAL EXHIBITION.

ABOUT ten years ago a British artist sketched an arresting picture in the centre of Ypres. The picture became known under the title of "The City of Fear," and portrayed the shattered ruins of the Cathedral and the renowned Cloth Hall, with a foreground of snow-covered road along which trudged an officer and his orderly, leading their horses. The picture recorded very truthfully the unspeakable desolation and the destruction of this place.

There will be many readers who carry personal memories of Ypres during the Great War, and to them in particular the change which, through God's good grace and the indomitable effort of a clever and industrious people, is now visible over this town and countryside, can appear nothing short of marvellous. The town has been practically rebuilt in a wonderful manner, and there is a spirit of enterprise evident which, in spite of political difficulties, augurs well for the early restoration of the beauty and prosperity of the district.

To some, the idea of material beauty being

prize, given by Her Majesty the Queen of the Belgians, for the best exhibit staged by a war-disabled man. Another extensive, mixed collection, including an example of carpet bedding, was cultivated near the spot known to many of us as "Salvation Corner," a spot beyond the Yser canal where our men began to light their pipes when marching back from the trenches. There were Roses, fruit trees and Conifers, all grown at "Railway Dugouts," near Zillebeke; collections of vegetables from Hooze, Roulers, Commynes, and all around the town, also one staged by some English residents in the locality, marked "Not for Competition," and considering it was produced at very short notice (Fig. 116), without special preparation, this must be recorded as a noteworthy effort. I think it was marked, as stated, not because it was thought it would never obtain a prize or because the exhibitors were too shy to carry off the first but in deference to the varied national tastes in vegetables. Most of the Belgian growers eye our Marrows and Parsnips with about as much interest as we do their soup herbs and etceteras. Anyway, several British seedsmen got a free unexpected advertisement as a result.

There was a splendid collection of sixty-two varieties of Apples and Pears grown at Vlamer-

FIG. 116.—YPRES HORTICULTURAL EXHIBITION: GROUP OF VEGETABLES GROWN BY THE BRITISH RESIDENTS.

temporarily supplied with them, but the time will come when one or more will be exhausted, and all collapse will follow. Daisies, Plantains and Dandelions will retain sufficient in their crowns for this purpose. The finer grasses are not such gross feeders, and consequently will hold out longer, and for a time will have an improved appearance. But let no one suppose that this happy state of things will continue indefinitely, if only nitrogen is applied. I have on several occasions seen plants rendered useless by excessive applications of nitrate of soda. If it is conceded that the principal good effected by heavy applications of nitrogenous fertilisers is in killing weeds, after this is accomplished there is no further necessity for such heavy applications which will possibly do more harm than good. There is frequently a shortage of one essential element in a particular locality. In this district potash is deficient, and neither Potatoes nor Tomatoes can be grown successfully unless potash is supplied. I also act on the assumption that there is a shortage of iron in our soil, for there are no large Oak trees in the neighbourhood, and I have noticed an improvement in the colour of Chrysanthemum leaves in twenty-four hours after applying a small dose of sulphate of iron. In another locality I have experienced an almost entire absence of lime, for water from the springs was softer than that collected from the roofs of houses. When the "missing link" is supplied, the effect on growth is marvellous. *Wm. Taylor, Bath.*

associated with this part of Flanders may appear incongruous, but those who knew the district, as it was before 1914 have memories of much that was indeed beautiful, and many of us can see evidence to-day of the return of that beauty.

A feature of interest to gardeners was the exhibition held on September 4 and 5, under the auspices of the Société Royale d'Horticulture d'Ypres, in a large, up-to-date school, close to the well-known Caserne buildings. It was really the second exhibition on a large scale held in Ypres since the war; the first was in 1924, and this one was described as "International."

The exhibits were mostly of locally-grown produce, but in addition there was a magnificent show of Dahlias, grown at Adinkerke, on the Belgian Coast, which gained the cup offered by the Belgian National Dahlia Society. Other collections of Dahlias came from France, Furnes and Poperinghe; there were also a good group of Ferns from Ghent, and a collection of cut hardy flowers staged by local British gardeners.

But the locally-grown exhibits were of special interest, and there were classes for decorative plants, flowers, fruit, vegetables, etc. There was room for improvement of course, as at most shows, but a really creditable display was made. There was one large collection of decorative plants in great variety, grown on the corner of the Menin road, and this earned a special

tinghe, near where the colossal army dump remained for years, and a less extensive but surely remarkable exhibit of twenty-eight varieties grown at Zonnebeke, on the Passchendaele ridge.

From all of this it will be evident that a great change has come over the country during the past few years and one to be profoundly thankful for. The judges included the veteran M. Louis Van Houtte of Ghent, and M. R. Peemans, the talented Horticultural Instructor for Western Flanders; there were also French and British representatives.

It was altogether a very amicable gathering, and I leave it to those who knew Ypres of old as "The City of Fear" to imagine our feelings as we stood bareheaded at the opening of the exhibition, within a stone's throw of the tragic Cloth Hall, while our national anthems were played by the town band. Truly "Peace hath her victories, no less renowned than war." *A. B. M.*

NATIONAL DAHLIA SOCIETY.

THE annual exhibition of this Society was held in the Royal Horticultural Hall, Westminster, on Wednesday, September 14, and was the largest show held by the Society in post-war times. It is pleasing to record the entries in the amateur classes showed a decided advance over previous years, while the trade exhibitors

greatly enhanced the value of the exhibition from a spectacular point of view.

The old Show and Fancy varieties appear to have lost their popularity altogether, for in the premier class for twenty-four varieties, distinct, there was only one entrant, Messrs. WM. TRESEDER, LTD., Cardiff, who were awarded first prize, for good examples of Dazzler, Tom Jones, Purple Prince, J. Ashby, Mrs. Langtry, Mabel, Colonist and Harry Keith. The next class for twelve blooms was represented by two entrants, Mr. A. T. BARNES, Bedford, securing first position with nice, clean flowers of Gold Medal, Mrs. Saunders, Peacock, Merlin and Lord Salisbury. Mr. H. LAMBERT, Raleigh, was second, and he had good examples of Sirdar, Mrs. D. Saunders, Claret Cup and Mr. Chamberlain.

CACTUS VARIETIES.

The class for twelve varieties, six blooms in a bunch, is usually regarded as the most difficult class in the schedule. Mr. H. WOOLMAN, Shirley, Birmingham, and Messrs. J. STREDWICK AND SON, St. Leonards-on-Sea, were the only competitors, and secured the prizes in the order named. It would be difficult to find fault with either exhibit, though Mr. WOOLMAN had the largest flowers and perhaps the best finish. The varieties employed in this instance were Alabaster, white; Ballet Girl, very fine, white and orange; Beauty of Penshurst, pink on a yellow ground; A. T. Barnes, pink and yellow; Yellow Bird; Thos. Want, yellow, suffused pink; Sidney Jones, deep pink; Silverhill Park, white; E. J. Robbins, crimson scarlet; and Essex, yellow. In Messrs. STREDWICK's stand were noted Mrs. W. Jackson, salmon-pink; Elsie Prior, yellow, suffused salmon; and Satisfaction, yellow, tinged lilac. In the class for twenty-four distinct varieties, Mr. H. WOOLMAN again led with fine flowers of H. Strutt, deep crimson; Ballet Girl; Sidney Port, yellow, suffused bronze; E. J. Robbins; Champion, crimson; May Flower, white; Essex; Mary Murray, bronzy red; Alabaster; Yellow Bird, extra fine; and Exhibitor, a large crimson; while Messrs. STREDWICK had fine flowers of Mrs. A. Harvey, Doreen Woolman, white with rosy tips; Elsie Prior; Mammoth, purple with lighter tips; and John Riding, crimson. Mr. H. LAMBERT was third.

In the class for twelve blooms Messrs. WM. TRESEDER, LTD., were successful, having good flowers of Mary Murray, Edgar Jackson, J. Emberson, Essex and Abbotsford. Class 6 was for six blooms, one variety, and Mr. H. WOOLMAN secured first prize with excellent examples of Torchlight, a beautiful reddish-bronze, followed by Mr. H. LAMBERT, who had finely coloured flowers of Ballet Girl. Messrs. J. CHEAL AND SONS, LTD., were the only exhibitors of garden Cactus Dahlias, in twelve varieties, arranged in vases with any hardy foliage, grasses or berries, and were deservedly awarded the first prize. The chief varieties were Mary Purrier, scarlet; F. W. Fellowes, orange; Edgar Jackson; Guardian, crimson; Elsie Prior; Miss Eckert, white, suffused pink; and Rival, deep red.

OTHER SECTIONS.

All Pompons are now exhibited in vases without artificial support, thus eliminating the wire frames. First prize in the premier class for twelve varieties, ten flowers in each vase, was well won by Messrs. J. CHEAL AND SONS, LTD., who staged excellent examples of Douglas, crimson; Emily Hopper, yellow; Queen of Whites; Girlie, heliotrope; Bacchus, scarlet; Adelaide, blush, edged lavender; and Tommy Keith, crimson, tipped white. Mr. A. T. BARNES was second, and Messrs. WATERER, SONS AND CRISP, LTD., third.

The modern Star varieties were represented in a single class for twelve varieties, ten blooms each, in vases. Here Messrs. J. CHEAL AND SONS, LTD., were well ahead with an exhibit tastefully arranged. The most attractive sorts were Gatton Star, salmon, shaded copper; Purley Star, rich carmine; Epsom Star, bright scarlet; Leigh Star, salmon pink; Hove Star, crimson-scarlet; White Star and Yellow Star.

Messrs. WATERER, SONS AND CRISP, LTD., followed with good examples of Epsom Star, Woodhurst Star, cerise suffused with rose; Yellow Star and Mrs. Rowett, amber, tipped rose.

Messrs. J. CHEAL AND SONS were successful for twelve varieties of single Dahlias in vases, staging typical exhibition flowers of Albatross, pure white; Owen Thomas, scarlet, tipped yellow; Beacon, yellow; Winona, deep maroon and Lady Bountiful, deep rose. Mr. H. LAMBERT was second.

Large Paeony-flowered Dahlias were an attractive class, the first prize going to Messrs. WM. TRESEDER for excellent flowers which, unfortunately, were not named. Messrs. J. CHEAL AND SONS were second, while Messrs. WATERER, SONS AND CRISP were third. The Miniature Paeony-flowered section found Messrs. WM. TRESEDER leading with a good collection, including Our Annie, yellow and pink; Cherry Red, suffused orange; Irma, soft rose, with orange base; Miss M. Hay, pink; and Bishop of Llandaff, crimson with coppery foliage. Mr. A. COBB, Shinfield, Reading, came second, with nice bunches of Mrs. A. S. Galt, orange-red, with dark foliage; and Charles E. Pearson, orange. Mr. W. YANDELL, Maidenhead, was third. In a smaller class for two vases of the same type, in mixed varieties, to exhibit their decorative value, Messrs. J. CHEAL AND SONS were placed first, followed by Mr. W. YANDELL and Messrs. W. TRESEDER in the order named.

There was a capital competition in the large decorative class for six vases of six blooms each; the first prize was well won by Mr. H. WOOLMAN, who arranged some splendid specimen flowers; the varieties were Mabel Lawrence, crimson-scarlet; Trentonian, copper and gold; Daily Mirror, pale lilac rose; Elinor Vandever, mauve; and Golden Fleece, golden-yellow, tipped white. Messrs. WM. TRESEDER were second, with fine examples of Jersey Beauty and H. B. May; third, Mr. F. NAGELS, Belgium.

The Collette type was only represented by Messrs. J. CHEAL AND SONS, who staged a nice collection of twelve varieties for which they received the first prize. The smaller class for six varieties resulted in a better competition, EARL BEATTY (gr. Mr. A. Barrett), Reigate, won the first prize, followed by Mr. H. WOOLMAN, with Messrs. WM. TRESEDER, third.

Competition was good in the amateur classes, the leading prize-winners being Mr. G. F. DRAYSON, Buckhurst Hill; Mr. A. BROWN, Leagrave; Mr. C. LUCKIN, Pulborough; Mr. W. G. CRAMP, Streatham; Mr. A. T. BARNES, Bedford; Mr. A. EVANS, Englefield Green, and Mr. F. CHENNELLS, Wheathampstead.

The Monro Challenge Cup for a display of floral designs was won by Messrs. WM. TRESEDER, for the third time in succession, and the award thus becomes their property; the second prize was awarded to Mrs. W. H. BROUGHTON (gr. Mr. A. Evans), Englefield Green, who staged on a small scale but the designs were well executed.

DECORATIVE CLASSES.

The floral classes were well filled in most cases and proved a source of attraction. There were six tables decorated with Star varieties entirely, Mrs. C. A. TISDALE, Woodford, winning first prize with a pleasing arrangement of Salmon Star, which describes the colour. Mr. D. B. CRANE, Highgate, was second, using Epsom Star; while Miss M. WOOLMAN, East Grinstead, came third with the well-known Surrey Star.

The class for tables, in which any Dahlias except the Star section could be used, attracted eight competitors, Mrs. C. A. TISDALE being placed first with an arrangement of Lady Mackintosh, coppery yellow, suffused with rose, which was very effective; Mrs. COURTENAY PAGE, Enfield, secured second prize with an arrangement of Winter Sun, a miniature Paeony-flowered variety, bright red with an orange centre; berried Berberis was also used here. Miss WOOLMAN was third with a table of Colletteres—Clansman, light mauve, and Strathmore, soft pink, flushed amber—a pretty combination.

For a single vase of Dahlias, Mrs. YANDELL, Maidenhead, had an arrangement of Delice,

pink, and Mr. C. H. Dresselhuys, silvery-pink, with appropriate foliage; this was awarded first prize. Miss M. WOOLMAN employed singles and Pompons with good effect for second place, while Mrs. R. JANES, Streatham Common, was third with an arrangement of Colletteres.

The class for a vase of Dahlias arranged for effect with any kind of foliage also received ample support. Mrs. A. J. COBB, Shinfield, Reading, won first prize, using Hilda D. Wheeler, a miniature Paeony, salmon rose in colour; Mrs. W. YANDELL was second, with Joyce Goddard, while Miss M. WOOLMAN came third, using the Cactus variety Edgar Jackson, of coral colour. Miss M. WOOLMAN had the best decorated basket, with crimson and scarlet shades; Mrs. C. A. TISDALE followed, using the amber and orange varieties—Marie Houtman, Marianne and Mrs. Scrimgeour.

Mr. J. EMBERSON, Walthamstow, won first prize for a bowl, and employed the well-known variety, Andreas Hofer, and a small white Pompon. Mr. WM. YANDELL was second, while Mrs. COURTENAY PAGE was third. In the class for three vases for a sideboard decoration, Mr. J. EMBERSON was the winner, using Andreas Hofer and a pale yellow Pompon; Mrs. WM. YANDELL came second with vases of yellow Pompons. Miss M. WOOLMAN followed with a pale yellow arrangement in Cactus, Collette and Pompon sorts.

The class for a single vase of Paeony-flowered varieties received good support; Mr. J. EMBERSON led with the scarlet variety Radium, which has excellent stems; Mr. A. J. COBB was placed second with one of his own varieties, Mrs. Skevington, amaranth-pink on orange, an effective variety; Mr. D. B. CRANE, third.

TRADE EXHIBITS.

The trade exhibits occupied the entire wall space of the hall, each exhibitor being allowed about thirty feet run. Mr. J. WOOLMAN, Shirley, Birmingham, relied chiefly on Cactus and large decorative varieties which were very fine, especially the Cactus sorts, Harry Strutt, rich crimson-scarlet; Yellow Bird, excellent; with the decorative Mabel Laurence, crimson-scarlet; Locarno, burnt amber; King Tut, burgundy; Jack Hobbs, creamy white; Rosa Taylor, dark maroon; and J. L. Crowther, buff apricot (Large Gold Medal).

Mr. J. B. RIDING had an arrangement chiefly of the large decoratives, interspersed with Charm, Pompon and other decorative varieties. Some of the most striking were Susan G. Tevis, a huge mauve variety; Cigarette, orange, tipped white; Jersey Beacon, brick red, with a buff reverse; Mabel Laurence; Sheba, deep rose; Talisman, crimson; Carmencita, yellow, speckled scarlet; Nichu, pale yellow; Mrs. I. de Warner, bright mauve; and Shadow Lavender, pale mauve with a deeper centre. (Large Gold Medal.)

Messrs. CARTER PAGE AND CO., LTD., presented a very tasteful display, arranged in large groups, of Prestige, Murillo, Andreas Hofer, Pink Favourite, The Prince, Orange Boven, and Secretary Voors. (Gold Medal.)

Mr. H. J. JONES, Lewisham, staged one of his well-known displays containing groups of The Clown, Dr. Helmuth Spath, Reginald Godfrey, Robert Trent, Prestige, Andreas Hofer and Acclamation. (Gold Medal.)

Mr. J. T. WEST had a fine display containing several Cactus novelties and other standard varieties, including Sparklet, a miniature Paeony, rich plum colour; Lilian C. Page, orange; Ullswater, yellow, suffused rose; and W. D. Cartwright, gold, a giant flower; while Cactus varieties occupied the front line. (Gold Medal.)

Messrs. WATERER, SONS AND CRISP, LTD., were awarded a Silver-Gilt Medal for a group which included, among others, Macdonald, scarlet decorative; La France, rose, tipped gold; Madame Wurfbain, purple; and Jersey Beauty.

Messrs. J. CHEAL AND SONS had a representative exhibit mostly arranged in tall pyramids, a few of the most striking sorts being Mrs. D. Hepburn, a large decorative sort, bright crimson; King Harold, maroon; Coulsden, a striking miniature variety, crimson, tipped gold; and

a good collection of Star varieties. (Silver Medal.)

Mr. J. EMBERSON exhibited a bright display, his best sorts being Cactus Ballet Girl, white, edged orange; The Imp, almost black; Andreas Hofer and Prestige. (Silver Medal.)

Mr. H. HEMSLEY had a mixed exhibit of Dahlias and excellent dishes of fruit. The chief varieties were Joyce Goddard, The Clown, Mrs. Crowley and Ebor. (Silver Medal.)

Mr. BERNARD WATERHOUSE, Crewe, had a small but well-grown exhibit of the decorative types very tastefully arranged. (Silver Medal). Mr. CHARLES TURNER also contributed a small collection of decorative varieties for which he received a Silver Medal. Messrs. JARMAN AND CO. occupied a corner of the hall very successfully; they were especially strong in Cactus varieties, well grown and well displayed. Collettertes and Pompons were also included in variety. (Silver Medal).

The DUTCH DAHLIA SOCIETY arranged a good display of their novelties in baskets, very tastefully. A few of the best were Madame E.

kept open during the evenings so soon as the days draw in.

The dates of this horticultural exhibition synchronised with the twenty-fifth birthday of the Federation of local horticultural societies, or, rather, of societies whose members are chiefly concerned with commercial horticulture, either as growers of fruits and vegetables for home use and export, or the cultivation of plants for export. There are over two hundred of these societies in Belgium, and they are grouped geographically, *i.e.*, by towns and districts, then by provinces, and finally there is the general federation. *La Tribune Horticole* is the official organ of the Federation, but under M. Gentil's editorship it is something more—a useful general epitome of horticultural activities in Belgium. As Director of the Horticultural section of the Ministry of Agriculture, our friend, M. H. Van Orshoven, takes a keen interest in the work of these societies and arranges courses of lectures and series of experiments (varieties and cultivation) at various centres. From this—and the fact that

Heliotropes, and delightful as this was we believe that if the Flandria Company or M. Draps-Dom had filled this central area with their big Palms, Cordylines, etc., a more imposing effect would have been produced. However, all this is a matter of taste.

We offer hearty congratulations to M. Eugene Draps, on whose shoulders has fallen the great burden of this show—and his Committee for getting together such a great show in September, in spite of continuously unfavourable weather, the low value of the Belgian franc, and other post-war difficulties. A "tombola" had to be arranged to secure the necessary funds for the show for, although the Government, the Province of Flanders and the City of Brussels smiled on the project, their smiles did not materialise into financial guarantees.

Judging commenced at 9 a.m. on the 10th inst, and the Jury was an international one, Belgium, France, Holland, Great Britain, Germany and Poland being represented on it. The Juré d'Honneur, to whom fell the task of awarding the various Prix d'Honneur, consisted

FIG. 117.—GENERAL VIEW OF THE INTERNATIONAL HORTICULTURAL EXHIBITION AT BRUSSELS.

Ludwig, bright crimson; Anna Kappel, amber, suffused rose; Delicata, heliotrope, shaded white; Cerise Queen, cerise, with a silvery reverse; W. Mengelberg, a beautiful orange; Red Emperor, and Aurantiaca, amber, with deeper tips. (Silver Medal.)

BRUSSELS INTERNATIONAL HORTICULTURAL SHOW.

WHEN Belgium celebrated the seventy-fifth year of its independence it did so on a grand scale, and some of the fine buildings erected in connection with the fêtes and exhibitions connected with that great event are still standing. One of them—a grand hall, lofty, spacious, light and airy—was used from September 10 to September 18 for the purpose of a great horticultural exhibition. We believe the hall to be larger than the Agricultural Hall at Islington, and it is certainly loftier and lighter but, unfortunately, it is not sufficiently well supplied with electric light to permit of its being

this Federation had a conference and outing lasting over several days—it will be gathered that M. van Orshoven and M. Gentil have had a very busy time lately.

But to return to the exhibition. It was so great as to surprise us—for there were also exhibits of fruit trees and shrubs outside the building—and yet we were disappointed with it. Perhaps we expected too much, and no doubt the memory of many great Ghent Shows created unfair comparisons. It was largely a cut-flower show, with Dahlias as the dominant feature; nevertheless, there were plants in abundance—big Palms, Cycads, Tree Ferns, Dracaenas, Cordylines and Rex Begonias, but in so vast a hall—and especially as these were for the most part arranged under the wide galleries—they were as a small "drop in the bucket" in regard to the general effect, as viewed from the end galleries.

The whole arrangement was on continental lines (Fig. 117), the floor space being laid out as a great garden, and exhibitors had to contribute various items to the general scheme. The central feature was a huge circular bed of fragrant

of M. Nombrot, Secretary of the Société Nationale d'Horticulture de France, as President; M. Lucien de Cock, Secretary of the Ghent Society, as Secretary; Comte de Kerchove de Denterghen, Governor of East Flanders; Baron de Kerchove d'Exaerde, President of the Federation of Belgian Horticultural Societies; M. Chas. Pynaert, Brussels; M. Paras, Gardener to the King of the Belgians, Laeken; Mr. E. Krelage, Haarlem; M. H. Van Orshoven; M. du Pre, President of the Société Royale La Flore, Brussels; M. Firmin Lambeau, the well-known amateur Orchidist of Brussels; Mr. Chas. H. Curtis (*The Gardeners' Chronicle*), and Mr. Rothe, Berlin. M. Roekens, of the Brussels Botanic Gardens was in attendance.

Mr. J. Coultts, Assistant Curator, Royal Gardens, Kew, and Mr. Albert E. Amos, Secretary of the National Dahlia Society, served on other sections of the Jury.

M. Eugene Draps presided at the luncheon, and Their Excellencies the Minister for Agriculture and the Minister for Science attended the opening ceremony, accompanied by many members of the Corps Diplomatique.

In addition to the large groups of Dahlias, Palms and other foliage plants, the leading features of the exhibition were the fine displays of fruits—Grapes, Apples and Pears, Orchids and big collections of vegetables.

DAHLIAS.

M. FRANCOIS NAGELS, of Wilryck, was the largest exhibitor of Dahlias, and his contribution, one of the largest in the show, was awarded a Prix d'Honneur. The flowers were arranged in baskets on tall stands with a few lower baskets here and there. The whole exhibit consisted of groups of various shapes and sizes arranged to form a Dahlia garden. More flowers were needed to make the display really effective. Leading varieties were the white Gloire de Aalsmeer; Nagel's Roem, salmon; Mrs. O. de Warner, purplish-mauve; Ambassador, scarlet and yellow; Roi des Jaunes, rich yellow; Madame Eugene Draps, mauve and red; Turkoois, purple and gold; Clown, scarlet and white; Avenir, old rose; and Ehrenpriess, rich pink and rose-red. All these were large decorative varieties of the type now very popular on the continent. M. DEFENSIE, Waerhghem, had an exhibit of Dahlias wherein Tully, salmon and yellow; Naegel's White, Meny Carlee and the popular pink and cream and Andreas Hofer were well shown. The Dahlias from M. LOUIS VAN HOUTTE's establishment in Ghent, consisted of bold lots of decorative varieties margined with Pompon sorts. Dahlias suitable for public gardens, including many of the varieties mentioned in these notes, were exhibited in quantity by the PARKS DEPARTMENT OF THE CITY OF ANTWERP, over which M. Van Rysselbergh presides so ably.

Andreas Hofer was finely shown by M.M. J. HOOGENSTEYN AND SONS, of Bennebroek, Haarlem, in one of the best arranged groups in the show; this display contained a beautiful scarlet and gold decorative variety—alas! unnamed—with blooms four inches to six inches in diameter. The flowers are of good form and borne on stiff, long stems; we believe it would prove a good garden sort, although, of course, we have not seen it growing.

Secretary Voorn, a large salmon decorative variety, the well-known Artus and a rich, self-yellow, decorative variety, named Narcissus, were attractive Dahlias in M. F. BRAEN STRAUS' exhibit from Andenkerke. In this and several other groups the variety Rapallo was shown; this is crimson, with gold base and buff tips; the florets are very broad and several of the disc florets assume a similar shape, but stand more or less erect, thus giving the flower a curious although by no means unattractive appearance.

M. BALLEGO, of Leiden, one of the leading Dahlia growers in Holland, showed the new Zinnia-flowered variety Apoldro; this is a miniature decorative Dahlia of rich crimson-scarlet colour that looks particularly well when the golden pollen covers the disk; stems and foliage are dark, bronzy green. A new Cactus variety of good form and deep coral red colour was shown by Mr. ALBERT E. AMOS, and bore his name; this and also the previous variety received a Certificate of Merit.

FRENCH SECTION.

The French section occupied a "garden site" at one end of the hall. M.M. VILMORIN-ANDRIEUX ET CIE, Paris, filled the central position with a large display of Celosias and Cockscombs—the latter in a great variety of colours—Gladioli in large baskets and massed decorative Dahlias at both ends. This firm also exhibited vegetables and salads in bewildering variety, and Melons of many sizes and colours.

M. CAYEUX LE CLERC, Paris, contributed Dahlias in variety, notably Monitor, orange; Madame Else Peeters, mauve and white; Raphael, orange and scarlet; and the big, handsome Jersey Beauty, of lovely old rose colour. The quaint "Star" Dahlias, in which the lateral margins of the ray florets incurve, were shown in great variety by M. MARTIN, of Degoin. Etoile Degoinaise was very much in evidence, but the variety we liked best was Roi Albert, yellow and deep brown. We

overheard an English visitor describe these as Star-fish Dahlias.

M. ANGUSTE NONIN, who was present with his son, exhibited Dahlias: Bordeaux, a very big crimson decorative variety; La Lorraine, a yellow, decorative Cactus sort that grows about four feet high; Andreas Hofer; Madame Diesny, mauve; Pride of San Francisco, salmon; Racine, amber-yellow; Maia, salmon; and Falbata, dull flame, were all shown well; the two last-named gained Certificates.

M. H. LE BLEVENCE, Bois Colombe, had a fine lot of Cattleya amabilis alba in his group of Orchids, and associated these with C. Hardyana alba, and Laelio-Cattleya Madame J. Andre Lazard. M. VACHEROT LECOUPLE, Boissy St. Leger, exhibited seedling Orchids from the germination stage (in flasks) onwards, and submitted specimens of Cypripedium Maudiae, Masdevallia Veitchii, Phalaenopsis Rimestadiana, and the golden Oncidium varicosum Rogersii.

M.M. MARON ET FILS, Brunoy, exhibited Orchids in the French section, and their group was notable for the many freely-flowered plants of Vanda coerulea it contained; with these were Phalaenopsis Rimestadiana, Cattleya Hardyana, C. H. alba and C. Rutilant.

The French section also contained Pears and Apples from M. PAUL LECOLIER; and various dwarf shrubs and Sempervivums from the MAISON FERARD.

ORCHIDS.

The main display of Orchids was in the gallery at one end of the hall, and the finest exhibit was the one from M. FIRMIN LAMBEAUX. In this we noticed many well-grown plants of Cattleya Carmen, C. Enid in variety, the white C. Madame Leten, Brasso-Cattleya Maronii alba, Laelio-Cattleya Liberation, L.-C. Lustrissima, and Cypripedium Maudiae. M. FIRMIN LAMBEAUX received the Prix d'Honneur for Orchids.

Messrs. STUART LOW AND Co., Enfield—the only British firm that exhibited—had a very bright group of Orchids, in which fine spikes of Oncidium varicosum Rogersii made a capital background for Cattleya amabilis, C. Venus, Brasso-Cattleya Ilene, Laelio-Cattleya Iris, Odontoglossum Alcimedea, O. Uro-Skinneri splendens, Cypripedium l'Ansonii, C. Massanianum and Brassia caudata.

M. MAURICE VERDONCK, Ghent, contributed a group of Orchids, consisting chiefly of Cattleya amabilis, C. Hardyana alba and C. Warscewiczii. In M. JANSSENS' group, Cypripedium Parishii, Stanhopea clunnea and Odontoglossum grande were conspicuous plants.

FOLIAGE PLANTS.

The principal exhibit of Palms and foliage plants was a big group of well-grown Kentias in variety, Latanias, Phoenix Roebelinii in fine condition, Cordylines, green and variegated, Cocos in variety, and many others; this was arranged near the foot of one of the staircases leading to the gallery; indeed, it was partly under the gallery, and therefore not so effective as it might have been. This exhibit from the FLANDRIA COMPANY, Bruges, obtained a Prix d'Honneur.

M. J. L. DRAPS-DOM, Brussels, set up a fine lot of big Palms, clean and of rich deep green colour; with these were big specimens of Cibotium Scheidei, various Cycads, Angiopteris evecta, Pandanus of sorts, and Agaves. Phoenix Roebelinii was well shown by M. GOOSENS, Brussels, who had a background of larger Palms and a groundwork of Selaginella Watsoniana. Cordylines, Alocasias, Dracaenas and Palms were also grouped effectively by M. L. DELARUE-CORDON, Ledeberg.

Coleuses appear to be popular in Belgium, judging by the large groups of these plants and the many examples that figured in mixed groups. The very large display made by M.M. CAMILLE HENDRIX ET FILS, Uccle, near the bandstand, attracted a great deal of attention; very few of the varieties were named but they included some seedlings with leaves of unusual size—so much as fifteen inches wide—

but of rather sombre colouring. If bright-leaved sorts of similar type were forthcoming they would be very useful grown either as bushes or as single-stemmed specimens.

M. ALPHONSE LAMBERT was another large exhibitor of Coleuses, and his well-grown plants were arranged effectively.

Another arresting group was the huge one of varieties of Begonia Rex, exhibited by M. JANSSENS, Marienberg. Some of the specimens were nearly four feet across, and there were at least a hundred plants. Some of the outstanding sorts were Minister Balls, silver and green; Madame Rene Rysselberg, green-edged, silver, green and purple; Roi Albert, deep olive green, silver and silvery purple. This fine display was awarded a special prize for excellent culture and the new varieties it contained.

VARIOUS EXHIBITS.

M. DRAPS DOM contributed a small and interesting Japanese garden, and also a series of miniature Japanese gardens in bowls and pans, a collection of Japanese shrubs, and a selection of Cacti.

From the BRUSSELS BOTANIC GARDEN came a collection of Belgian horticultural and botanical books and a series of portraits of celebrated Belgian botanists and horticulturists—Rodegas, Linden, Van Mons, Verschaffelt, Cogneaux, Louis van Houtte, van Geert and Comte de Kerchove.

The COLONIAL DEPARTMENT OF THE BELGIAN GOVERNMENT submitted a realistic display of economic plants grown in the Congo, planted around a native hut, with models of native folk standing around.

The OFFICIALS OF THE FOREST OF SOIGNE contributed an interesting exhibit of timbers and the pests that attack timbers, while another exhibit of trees and shrubs came from the Arboretum at Turvueren.

Garden plans and paintings of flowers filled several bays at the end of the gallery.

Roses were shown in large numbers by MM. JUCHEM ET FILS, LEON KERKVOORDE, M. FRANCOIS DERRAIS, M. ALPHONSE BRAECKMANS, M. H. VLAMINC and MM. BUYB FRERES, but in no case were the flowers of good quality, the wet weather having dealt severely with them.

M. EUGENE DRAPS submitted a very attractive collection of floral designs and grouped them admirably.

FRUITS.

Fruits were exhibited uncommonly well and extensive displays were made in one of the wide, well-lighted galleries.

The HORTICULTURAL SCHOOL, Louvain, contributed a fine collection that contained splendid examples of Pears Beurré Hardy, Triomphe de Vienne, Beurré Clairgeau, Beurré de Nagan, Beurré Sterckmans, Madame Treyve, Beurré Baltet Pére, Beurré Mortillet, Durondeau, and Bergamot Phillipot—a variety unknown to us. This fine collection was awarded a Prix d'Honneur. M. C. COENE-GEETS, Malines, contributed good specimens of Golden Noble, Bismarck, Blenheim Pippin, Transparent de Cronceels, Emperor Alexander, Peasgood's Nonsuch and Reinette du Canada Apples, and although few were well coloured all carried a fine "bloom."

A large and interesting collection of varieties of Pears and Apples came from M. ROUMIE, Eiseux; many of these were uncommon sorts but it was quaint to find the familiar Peasgood's Nonsuch labelled "Sans Pareil de Peasgood."

A magnificent exhibit was staged by the HORTICULTURAL SCHOOL OF VILVOORDE, where practically every thing is grown on commercial lines with great success. There were vases of popular Dahlias, many splendid specimens of the yellow-margined Sansevieria Laurentii and fine plants of variegated Bougainvilleas, but the fruits were the great feature. These were all first class specimens, clean and of large size, set up in white-papered boxes. A few outstanding Apples were Peasgood's Nonsuch, Emperor Alexander, Bismarck, Belle de Boskoop Belle de Pontoise, Cellini, Queen, Reinette d'Etoile and Cox's Pomona, while the best Pears were Beurré Diel, Louise Bonne of Jersey (finely coloured), Le Lectier, Passe Crassane, Williams's Bon Chrétien, Pitmaston Duchess, Triomphe

de Vienne, President Roosevelt, Marguerite Marillat, Clapp's Favourite, Doyenné du Comice and Marguerite Marillat. We have never seen such fine fruits in such quantity.

Grapes were exhibited in great style and number. The huge "bunches" shown by MM. ED. STOUFFS ET FILS, La Hulpe, were some of the finest examples of skillful manipulation we have ever seen. The were made-up bunches and how many clusters had gone to the make up of one "specimen" we cannot state, as no one would tell us, and a Commissionaire on duty saw that the command, "do not touch" was religiously observed. The effect of these aggregate bunches may be gathered from the statement that Cannon Hall Muscat weighed 12 kilos; Roi Albert (black), 12 kilos; Moranet, 12 kilos and Gros Maroc, 19 kilos. Needless to state, this exhibit of "Grapes of Eshcol" never lacked a crowd of excited visitors—a British visitor described them as "fiction founded on fact."

The HOEYLAERTE GROWERS made a fine display of excellent bunches of Alicante, Roi Albert, Moranet, Black Hamburg, Gradis, Muscat of Alexandria and Gros Colmar Grapes, and some fine Peaches and Canteloupe Melons. M. ARTHUR DE SMET and M. WILLY DE SMET, both of Groenendaal, each exhibited Grapes as packed for export, and these included some capital bunches of Cannon Hall Muscat and Muscat of Alexandria, while the last-named exhibitor included big clusters of Gradiscat, a white Grape of moderate Muscat flavour.

VEGETABLES.

Fine displays of vegetables in great variety were made by various groups of market gardeners. These displays included a greater variety than we are accustomed to see in England and included a large series of herbs, Chicory, Dandelion, tiny Brussels Sprouts, Celeriac, huge Savoy, several sorts of dwarf Celery, white Cucumbers, Capsicums, Aubergines, Seakale Beet, Lamb's Lettuce and variously coloured Beans. One of the best of these displays was made by the market gardeners of Namur.

ABERGAVENNY.

THIS successful event was held on September 1, 1927, in Bailey Park, Abergavenny, and both the competitive and honorary horticultural exhibits were more numerous and of a higher quality than in previous years. Outstanding features were the superb collection of vegetables, Onions, fruits, Roses and collections of hardy flowers. Among the exhibits not for competition a Gold Medal was awarded to KING'S ACRE NURSERIES, Hereford, for pot fruit trees. The same firm also gained a Gold Medal for a tastefully arranged group of cut flowers. Messrs. I. HOUSE AND SON, Bristol, put up a fine lot of Scabious, for which they gained a Silver-gilt Medal. Mr. H. TOWNSEND, Abergavenny, secured a Gold Medal for a miscellaneous display of cut flowers, the whole most tastefully arranged. A new exhibitor, Mr. S. G. WILLIAMS, of Abergavenny, also gained a Gold Medal for a meritorious group of flowers and fruits.

From JOHN WILSON, Esq., Hereford, came a well-staged group in which Gladiolus played a conspicuous part, and was awarded a Silver-gilt Medal.

In the class for the best trade exhibit, the Vaughan-Morgan Challenge Shield and Silver-gilt Medal were won by Messrs. FRASER AND BROWN, of Abergavenny. They staged a bright and effective group. The second prize, consisting of a Silver-gilt Medal, was secured by Messrs. PITT AND CO., Abergavenny, who had delightful vases of Carnations, Dahlias, etc., while the third prize, a Silver Medal, was won by Messrs. ENGLISH AND SON, Gloucester, with a nice collection of Roses. Messrs. J. BASHAM AND SONS, Newport, easily led for Roses with exquisite blooms. The second prize was awarded to Messrs. ENGLISH AND SON, Gloucester.

For a collection of twelve dishes of hardy fruit, the Challenge Cup and first prize was awarded to Miss C. SOLLY FLOOD, Porthmawr.

The class for a collection of vegetables attracted five or six first-class displays, and the first prize and Challenge Cup was deservedly

won by Mr. L. R. PYNE (gr. Mr. J. Evans), Abergavenny. Mr. A. TURNER, Aberavon, was a good second, and Mr. W. EVANS, Barry, third.

CARDIFF AND COUNTY HORTICULTURAL.

THE thirty-third annual show of the Cardiff and County Horticultural Society was held in the Drill Hall, Cardiff, on the 7th and 8th inst. The exhibits attained a satisfactory standard, fruits and Roses being outstanding features. The attendance was small on the opening day, and possibly inclement weather kept the public away on the second day. Mr. Donald Cory, Chairman of the Society, who presided at the opening ceremony, expressed the view that the people of Cardiff lacked interest in horticulture. That can scarcely be, for Cardiff is a city of beautiful public parks and private gardens, but it is regrettable that her people and the people of the principality generally do not accord a greater measure of support to this very desirable show.

The following are the principal awards:—

Collection of dessert fruit: First, Mr. W. H. BRIAN, Cwrt-y-rala; second, Captain FLETCHER, Margam Abbey. Two bunches of Grapes: First, DOWAGER LADY WATSON, Newport; second, Mr. W. H. BRAIN; third, Mr. J. E. T. TURNER, Lisvane. Six dishes of dessert Apples: First, Mr. W. H. BRAIN; second, Mr. J. W. PYMAN; third, Rev. A. C. LEE, St. Andrews. Six dessert Pears: First, Mr. W. H. BRAIN; second, Mr. J. E. T. TURNER; third, Rev. A. C. LEE. Dish of nine dessert Plums: First, Mr. W. H. BRAIN; second, Capt. FLETCHER; third, Rev. A. C. LEE.

Collection of Vegetables: First, Mr. D. P. JONES; second, Mr. S. F. MORGAN; third, Mr. F. JENKINS.

Dish of twenty pods of Peas: First, Mr. W. H. BRAIN; second, Mr. H. COOMBS; third, Mr. D. A. BURNS.

Dish of twenty Runner Beans: First, Mr. W. H. BRAIN; second, Mr. E. J. MATHEWS; third, Mrs. M. MORGAN LEWIS.

Dish of six bulbs of Premier Onions: First, Mr. J. E. T. TURNER; second, Mr. T. HALE; third, Major GASKELL.

The best collection of Roses (open class) was shown by Messrs. WM. TRESEDER, LTD., Cardiff; second, Messrs. J. BASHAM AND SONS, Bassaleg. Messrs. TRESEDER also showed the best collection of Dahlias, arranged for effect; second, Mr. H. CLARKE, Taunton.

NATIONAL CHRYSANTHEMUM.

SEPTEMBER 12.—At their first meeting of the season, the Floral Committee of this Society found more novelties than usual for their consideration, and awards were made to the following early-flowering varieties, while the Committee wished to "see again," and accompanied by a plant, the variety Bedding Yellow, a compact, bright yellow variety, shown by Mr. H. SHOESMITH, Junr.

FIRST CLASS CERTIFICATE.

Mayford Bronze.—A bright and attractive flower which belongs to Section II, i.b. The disbudded blooms have straight, rolled florets of bright bronze colour. Shown by Mr. H. SHOESMITH, Junr.

Gloria.—This is a rich yellow variety of the same section as the above. The flat florets droop at their tips, making a graceful flower of good market size and plenty of substance. Shown by Messrs. CRAGG, HARRISON AND CRAGG.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

MR. J. R. BUTLER presided at the monthly meeting of this Society at the R.H.S. Hall, on Monday, September 12. Seven new members were elected. Five members were allowed to withdraw from their deposit accounts the sums amounting to £85 15s. 7d., and one lapsed member withdrew £41 3s. 6d. The sum of £12 6s. 8d., plus £15 funeral benefit, was passed

for payment to the nominee of one deceased member.

The sick pay on the private side for August amounted to £65 4s. 11d., and on the State Section, £62; maternity benefits totalled £21 10s. Sums amounting to £63 10s. 9d. were made in grants to sixteen members for dental and surgical benefits, and fourteen other cases were considered.

Mr. D. Crockett of Putney Heath was co-opted a member of the Committee in the place of Mr. J. Craik, who had resigned.

ANSWERS TO CORRESPONDENTS.

CUCUMBERS FAILING.—G. W. Your Cucumber fruits are suffering from gummosis, caused by the fungus, *Cladosporium cucumerinum*. This disease appears in cases of excessive humidity and if your pits are covered in you would find it well to ventilate them as much as possible. You should also spray the plants with liver of sulphur and flour paste in the following proportions: 1½ oz. liver of sulphur and 1½ oz. of flour to two gallons water. Dissolve the liver of sulphur in fourteen pints of water. Mix the flour into a paste with a little water and then add more water to make two pints, taking care there are no lumps. This should be boiled, stirring it meanwhile and, when it froths, added to the liver of sulphur and mixed thoroughly. The spray is then ready for use. The diseased fruits should, of course, be removed.

MELONS FAILING.—H. S. Your Melon plants are suffering from Verticillium wilt, caused by the fungus *Verticillium albo-atrum*. This organism exists as an occasional infection of soils, and it is possible that infection has come from the bed upon which the pots are placed. The latter may be sterilised by steam or by means of a two per cent. solution of formaldehyde. One gallon of forty per cent. formaldehyde should be diluted with forty-nine gallons of water in a tub, and applied to eighteen square yards of bed surface. The house should be empty when this process is applied, and the inside of the superstructure should be washed down with the same specific.

NAMES OF FRUITS.—B. J. F. 1, Hanwell Souring; 2, Yorkshire Greening; 3, Striped Beefing; 4, Small's Admirable; 5, Lane's Prince Albert; 6, Lady Sudeley; 7, Greenup's Pippin (syn. Yorkshire Beauty). *Altho*. Apple Wealthy; Pear Jalousie de Fontenay.—G. D. 1, Alfriston; 2, Winter Greening (syn. Easter Pippin); 3, decayed.—J. S. Apple Lady Sudeley.—A. M. It is impossible to name the Pear, as it is only half-grown; send again when fully developed.—J. C. 1, Early Transparent; 2, Gladstone; 3, specimen insufficient for determination.—Wicken-dew. Probably Washington Plum.

NAMES OF PLANTS.—A. C. Galeopsis angustifolia, the narrow-leaved Hemp Nettle which occurs mostly on chalk.—E. C. L. 1, Escallonia montevidensis (S. America); 2, Spiraea japonica Bumalda variegata (the last name is usually left out, as the plant often becomes green; 3, Impatiens Roylei, or Royle's Balsam, a native of the Himalayas. K. M. R. 1, Sidalcea candida; 2, Phyllanthus atropurpureus; 3, Nandina domestica; 4, Isoloma hirsutum.

TOMATOS AND FERNS FOR EXAMINATION.—R. W. R. The Tomato fruits had burst in the box when it reached us, and the material was in such bad condition that examination was impossible. The Adiantum leaves are attacked by a fungus, probably Gloeosporium. We would advise removing the diseased fronds and dipping the plants in a solution of liver of sulphur.

MARKETS.

COVENT GARDEN, Tuesday, September 20th, 1927.

WE cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Tuesday by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market and the demand, and they may fluctuate, not only from day to day, but occasionally several times in the day.—EDS.

REMARKS.—The unfavourable weather conditions have been responsible for a general shortage throughout this department during the past few days. Bunch spray white Chrysanthemums have been particularly short in supply, and prices have advanced also for coloured blooms. The newest arrivals in disbudded blooms are Mona Davis and Bronze Cronsel. The best quality Carnations and Roses are soon cleared at increased prices. Arums (Richardias) are the latest arrivals in this department, but the quality at present is not good. Single Violets from Devonshire and Cornwall are coming to hand in very fair condition and supplies are now increasing almost daily. Aster Amellus King George is now arriving in good condition, and Physalis is now receiving more attention for decorative purposes. Gladioli are practically finished and Giant Scarlet and Giant White are the best that remain. Statice are about finished. A few bunches of Honesty have been on sale this week.

REMARKS.—There is practically no improvement in the unusually slow conditions prevailing in Covent Garden at the present time. It is highly probable that a few days of fine weather would have a bracing effect on the public demand for fruit, and the feeling here is "the sooner the better." Hothouse Grapes are plentiful and cheap, ample supplies arriving from Belgium and the Channel Islands, in addition to those home-grown. The Plum trade is one of the few bright sections in the business at the moment. The bulk of arrivals are Monarch, with a few Pond's Seedling, Bush and Damsons, all of which are selling freely. The Apple market is very congested with produce, and prices generally are low. There is a good inquiry for a few special Worcester Pearmain, Cox's Orange Pippin and James Grieve, also for some large

cookers, but the greater proportion of fruit available is very second-rate, which is more or less usual in a heavy Apple year. Tomatoes are scarce, but the absence of demand prevents any increase in selling levels, in addition to which arrivals from Jersey are increasing. Cucumbers are in shorter supply and prices have hardened. There are a few more field Mushrooms available, but cultivated Mushrooms continue scarce and dear. The green vegetable section is moderately heavy, with most items an improving business. Blackberries, both wild and cultivated, are selling well, but the quantities so far have been comparatively small. The Potato trade remains about the same as last quoted, with supplies sufficient for the demand at the present price levels.

GLASGOW.

THE cut flower market was fairly active last week and the large supplies of disbudded Chrysanthemums received each day from the South of England were readily disposed of—in some cases before the customary auction sales began—at the following prices:—Debutante, 1s. 6d. to 2s. per 6's; Pink Delight, 1s. 3d. to 1s. 6d.; Harvester, 1s. to 1s. 4d.; Betty Spark and Amber Queen, 1s. to 1s. 3d.; No. 1 White, 1s. 4d. to 1s. 9d.; Holicot Yellow, 10d. to 1s. 2d.; Holicot Bronze, 1s. to 1s. 4d.; Alcalde, 2s. to 2s. 9d. for 12's; Phoenix, 1s. 3d. to 1s. 9d.; Phoenix, large sprays, 10d. to 1s.; small sprays, 3d. to 8d.; Betty Spark, sprays 10d. to 1s. 2d. Prices of Ophelia and Madame Butterfly Roses ranged from 3s. 6d. to 4s. per dozen; Roselandia and Golden Ophelia made 2s. to 3s.; Richmond and Mrs. H. Stephens, 1s. to 2s.; Carnations realised 2s. 6d. to 3s. per dozen; Gladioli, 2s. to 3s.; Lily-of-the-Valley, 3s. to 3s. 6d. per bunch; Lilium longiflorum (Harrissii), 2s. 3d. to 3s. per dozen; L. lancifolium rubrum, 2s. to 2s. 6d.; Smilax, 1s. 6d. to 2s.; Asters and Calendula, 2d. to 4d.; Sweet Peas, 1d. to 3d.; and Asparagus foliage, 9d. to 1s.

A steady business was done in fruit, which included a large quantity of Plums. Scotch-grown Victoria Plums made 10d. to 1s. per lb.; English-grown, 10s. per sieve; Monarch was worth, 8s. 6d. to 10s. 6d.; Bush Plums, 7s. 6d. to 9s. 6d.; Magnum Bonum, 7s. to 9s.; Kent Damsons, 9s. to 10s. per sieve; and Worcester Damsons 11s. to 12s. Gravenstein Apples fetched 10s. to 14s. per case; York Imperial, 25s. to 28s. 6d. per barrel; and Lord Derby, 20s. to 25s. per cwt. Grape Fruit (Californian) realised 45s. to 47s. per case; Sunkist Oranges, 28s. to 31s. per case; South African Oranges, 16s. to 22s.; bronze Melons, 6s. to 10s. per case. Blackberries made 4d. per lb.; Beurré Hardy Pears, Block, 15s. to 16s. half-case; Anderson's, 27s. to 29s. case; and Grapes, 15s. to 26s. per barrel.

In the vegetable section prices for Tomatoes were firm at 7d. to 8d. per lb. French Beans made 4d. to 5d. Mushrooms, 3s. 3d.; Cauliflowers, 4s. to 5s. per dozen; Cucumbers, 2s. to 5s. per dozen; Lettuces, 1s. 9d. to 2s. 3d. Broad Beans, 1s. 6d. to 2s. per stone; and Rhubarb, 4s. 6d. per cwt.

TRADE NOTES.

THE firm of Messrs. J. C. Wheeler and Son, Ltd., of Gloucester, went into voluntary liquidation in September, 1926, but has now been reconstituted under the same style and title, and has acquired from the original company the goodwill of the seed and nursery businesses, the stock in hand, and nursery grounds of about fifty acres at Barnwood.

AN interesting sale takes place on October 5, 6 and 7, at the Sunningdale Nurseries, Windlesham, when a large number of choice Rhododendrons will be sold by auction by Messrs. Protheroe and Morris. Not only garden sorts, but Himalayan and Chinese species will be offered at this fifty-third sale in what was once known as Noble's Nurseries.

MESSRS. A. G. LEIGHTON, LTD., seedsmen, of Newcastle, Staffordshire, have moved to Whitchurch, Shropshire, where they have new and up-to-date premises for the handling of their business, and sufficient ground for raising their special stocks of flower and other seeds.

GARDENING APPOINTMENTS.

Mr. W. Bradley, for the past two years and nine months gardener to Captain SAVILE, Ven House, Milborne Port, Somerset (tenant for the past nineteen years), as gardener to Sir HUBERT MEDLEYCOTT, Bart., the owner of the estate.

Mr. F. J. Maidment, for over nine years gardener to C. H. TURNOR, Esq., Stoke Hall, Grantham, as gardener to A. S. HOWARTH, Esq., Whittington Hall, Kirkby Lonsdale, Westmoreland. (Thanks for 2/- for R.G.O.F. Box.—EDS.)

Mr. C. E. Saunders, previously gardener to the DUKE OF SOMERSET, Maiden Bradley, Bath, as gardener to the Hon. LORD HYLTON, Ammerdown Park, Radstock.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 52.5°.

ACTUAL TEMPERATURE—
The Gardeners' Chronicle Office, 5, Tavistock Street,
Covent Garden, London, Wednesday, September 28,
10 a.m. Bar. 30.3. Temp. 55°. Weather, Fine.

It is a good many years now since it was shown **Soil Sterilization.** that soil sterilization often leads to a large increase in yield. An example of the magnitude of the increase achieved by this means is provided by Mr. J. Harnett's experiments* with the soil in Tomato houses, and inasmuch as large-scale, comparative experiments are rarely made, it is desirable that they should have wide publicity. In Mr. Harnett's first experiment twelve houses were included. Previous to 1925, ten were sterilized by steam and two were not. The latter gave yields of twenty-nine tons of Tomatos per acre, whereas the former gave fifty-one tons. Toward the end of 1925 nine of the houses steamed the previous year were treated again in like manner. They again gave (in 1926) a yield of fifty tons per acre; but two houses sterilized by steam in the previous year were not so treated in 1925, and their yields dropped in 1926 to thirty-nine tons. The figure for the houses which had not been

treated neither in 1925 nor in the previous years was twenty-nine tons. The result is, perhaps, surprising and certainly instructive, for it tends to show that even after one year's crop has been taken the soil, or rather the crop, benefits by a repetition of the sterilizing process. Another experiment is no less instructive. The crops (Tomatos) derived from eight houses had never exceeded thirty-five tons to the acre, although the soil of these houses had been liberally and judiciously manured. In the year in which the experiment was made, the soil of six of these houses was sterilized, and that of the other two was not; result, a fifty-ton crop from the sterilized against a thirty-two ton crop from the unsterilized. Other experiments in which the relative merits of steam-heat and of an antiseptic, cresylic acid, were tested, give clear evidence in favour of the use of steam-heat as a means of sterilization. Although much and valuable work on the scientific aspects of soil sterilization has been done—particularly by Sir Henry Russell—there is still ample room for further investigation. The current view that the benefits of soil sterilization are due to a differential destruction of soil bacteria and also to a liberation of plant food may prove ultimately to be correct. It is, of course, probable that the effect of heat may also be due to a destruction of all manner of soil pests, which, if left in possession of the ground, would pester the plants and reduce their yields. Nevertheless, we are inclined to think that part at least of the beneficent action may be due to the liberation of substances which have a specific stimulatory effect on plant growth and development. In any case, the suggestion is worth investigating. That such substances exist there can be no doubt. The plant probably manages its own growth by means of such agents. To discover their existence outside the plant and to prove their powers would mark a notable advance in science, and might prove of real value in practice. That there are more things in soil-science than are writ down in our philosophy is certain. The *Twelfth Annual Report* already cited contains among much other valuable and suggestive experimental data an account of the decreasing yields which occur in glasshouse soils kept under continuous cultivation. No matter whether the soil was manured or not, continuous cultivation led to a marked decrease in yield, albeit, that, as is to be expected, the decrease was greater in the unmanured than in the manured soils. Following such constantly cultivated soils results in a recovery, though why it should remains for science to determine.

National Sweet Pea Society.—The Annual General Meeting of the National Sweet Pea Society will be held in the R.H.S. Hall, Vincent Square, London, S.W., on Wednesday, October 19, 1927, commencing at 3 o'clock in the afternoon. The President, Mr. J. M. Bridgeford, will entertain the members to tea at the close of the meeting.

Sale of the Rosslyn Orchid Collection.—The seven days' sale of the late Mr. H. T. Pitt's Orchids at Rosslyn, 57, Stamford Hill, London, N.16, realised a total sum of £10,729. The sale was well attended and attracted purchasers from Belgium, France, Germany and America. The catalogue included 2,885 lots, all of which, with the exception of a few at the end, were Orchids. The gem of the collection was a splendid plant of *Odontoglossum Purple Emperor*, with three fine pseudo-bulbs, and this realised 340 guineas, whilst another plant of this beautiful Orchid fetched 310 guineas, and still another 250 guineas. One hundred guineas was obtained for a plant of *Odonto-*

glossum crispo-Solon, Pitt's variety, with five pseudo-bulbs, and 35 guineas for a smaller plant with two pseudo-bulbs, while another with three pseudo-bulbs sold for 36 guineas. Other big prices were *Miltonia Lord Lambourne*, 100 guineas; *Odontioda Lady Veitch*, 80 guineas; *Odontoglossum Vivian*, 56 guineas; *Laelio-Cattleya Hassallii alba*, Cowan's variety, 54 guineas; 54, 46 and 40 guineas respectively for three plants of *Odontoglossum St. James*; 44 guineas for *Laelio-Cattleya Queen Mary var. Memoria Sir George Holford*; the same amount for *Odontioda Duchess of York*; and 42 guineas for *Cattleya Prince Shimadzu var. Springtide*. Competition was remarkably keen throughout the sale, and the large number of seedling Orchids were eagerly bought up. The sale commenced at 12 o'clock each day; refreshments were served at about 1.30 p.m. each day, and tea later in the afternoon.

Land Drainage Problems.—The Royal Commission on Land Drainage has just returned from a highly instructive and interesting inspection of the Dutch systems of Drainage, which they have carried out at the invitation of the Netherlands Government. The Commissioners examined typical drainage areas and river outfalls, and saw the works of sea defence and land reclamation which are being carried out south of the Hague, and on the Zuyder Zee, respectively. The Dutch systems of drainage, rating and administration were explained to the Commissioners in lectures given by the Dutch experts, and practical examples were pointed out on the ground. Throughout their tour the Commissioners received every assistance from the Dutch authorities, whose unfailing courtesy afforded opportunities for the acquisition of most useful knowledge under ideal conditions. The Commissioners have arranged to hear evidence at the House of Lords from the Association of Municipal Corporations, the Urban District Councils' Association and the Cheshire County Council. The evidence of the officials of the Ministry of Agriculture will also then be concluded, and the Commissioners will forthwith proceed to consider the lines on which their report will be drafted.

The New Kelvin Hall, Glasgow.—The new Kelvin Hall at Glasgow, which is built upon the site of the former structure, destroyed by fire in 1925, will in all probability be used for the next horticultural exhibition, as it was formally opened by the King in July this year. It is a noble and dignified edifice, fit to take its place in the important group of buildings in the immediate vicinity, and of massive proportions. It comprises three parts, namely, the administrative block; the main, or exhibition hall, with its adjuncts comprising tea-room, platform, and reception room; and the store block, which includes the electricity sub-station on part of the lower ground floor. The area enclosed by the walls of the main hall is 171,000 square feet; for comparison it may be stated that the area of the Agricultural Hall, Islington, London, including the annexe and arcade, but excluding the gallery, is only 128,300 square feet. Three cupolas, forty feet wide and extending almost the whole length of the hall, give a remarkably uniform distribution of light over the whole area, and help to provide adequate means of ventilation. In addition, the fans which form part of the heating batteries can be used when required to cool the atmosphere. The building is fire-proof, and every facility and convenience, including ample means for carrying away waste water, have been provided for exhibitors.

Henry Eckford Memorial Fund.—This fund was established many years ago for the purpose of commemorating the late Mr. Henry Eckford, of Wem, Shropshire, who was the first to undertake the development of the Sweet Pea from the unpromising material then available. The fund has provided a gold Henry Eckford Memorial to someone who has done good work on behalf of Sweet Peas, but unless further donations are received it will not be possible for the trustees to award a medal annually each year. Thanks, however, to the efforts of Mr. F. T.

* Experimental and Research Station, Nursery and Market Garden Industries Development Society, Ltd., Turner's Hill, Cheshunt, Herts. *Twelfth Annual Report*, 1926.

Wheler, the Chairman of the Committee of the National Sweet Pea Society, a handsome contribution was obtained from friends present at the luncheon on the occasion of the Society's show at Westminster. A further contribution was received on the occasion of the Sweet Pea Outing to Reading. A general appeal is now being made in the hope that by the date of the annual meeting of the N.S.P.S. (October 19) a further sum of £25 may be obtained, to enable the trustees to make an investment that will bring in sufficient to provide a gold Henry Eckford Memorial Medal every year and thus perpetuate for all time the memory of the Grand Old Man of the Sweet Pea world. Donations should be sent to Mr. C. H. Curtis (Convener of the Memorial Trustees), 5, Tavistock Street, Covent Garden, W.C.2.

Urea: a New Fertiliser.—Amongst the new nitrogenous fertilisers now being manufactured in Germany is a material known as Urea, which, owing to its high content of nitrogen—forty-six per cent.—is of importance, if only for the saving which is effected in its transport. Small quantities of this fertiliser have been imported into this country for experimental purposes, but its use has been handicapped by the fact that, up to recently, it has been subject to an import duty of 33½ per cent. *ad valorem* under the Safeguarding of Industries Act, 1921. The *Journal* of the Ministry of Agriculture states that steps are being taken which, it is hoped, will lead to the future manufacture of the material in this country; but, in the meantime, owing to an Order recently made by H.M. Treasury exempting it for a period—from June 27, 1927, to March 6, 1928—from the duty imposed by the Safeguarding of Industries Act, it is now possible to obtain supplies for use in this country at a cheaper rate than formerly.

Electrified Cardboard for Crops.—A patent has been taken out in Germany by a Berlin inventor named Alex. Wendler for a kind of paste-board in which are inserted wires which, when connected with an ordinary current of electricity, become heated and diffuse warmth throughout the boards. These boards can be used for a variety of warming purposes, but horticulturists are chiefly interested in their possibilities as aids to the forcing of plants. Experiments have already been carried out, and have proved successful, in the use of boards as a protection from frost; they are arranged over the surface of the ground, the current is turned on at night, and the ground thus kept slightly warm. Whether their usefulness could be extended further if they were buried in the earth itself, being previously treated with tar to prevent rotting, to supply warmth to the actual roots of the crops, is a subject for further experiment. As regards price, it may be pointed out that most electricity undertakings are willing to supply current during the night (from 10 p.m. onwards) at a reduced rate. In Berlin, the night price works out at about five pfennigs per kilowatt hour; and in the Vienna State Nurseries, where experiments were carried out with Roses, it was calculated that, at a time when Roses were selling at 3d. to 5d. per bloom, the cost of the extra warmth which enabled the blooms to develop two to three weeks earlier than they would otherwise have done, worked out at less than a farthing each. The cost of the boards themselves is trifling, and a trial would be worth while, as they may be attached to any ordinary installation. In Berlin, the largest electrical works are taking a keen interest in the matter, and are eagerly assisting the growers in the vicinity of the city to make experiments with the Wendler boards. The well-known firm of L. Späth has made some interesting trials of the method, using the boards as protective material just above the surface of the ground, with very striking results.

"Kew Bulletin."—The current issue of the *Bulletin of Miscellaneous Information* (No. 7, 1927), issued from the Royal Botanic Gardens, Kew, contains a revision of the genera of Magnoliaceae, by Mr. J. E. Dandy, who adds four new genera, *i.e.*, *Alcimandra*, *Pachylanax*, *Elmerrillia* and *Kmeria* to those already recognised, *i.e.*, *Talauma*, *Manglietia*, *Magnolia*,

Aromandendron and *Michelia*. Under "Notes on African Grasses," several new species are described, and these descriptions are followed by an enumeration of the Uganda species of Grasses by T. D. Maitland and C. E. Hubbard. The Orchid genera of Paphiopedilum and Phragmopedilum (certain groups of "Cypripediums") are discussed by Messrs. Sprague and Summerhayes; it appears that Rolfe's "Cordula" has preference over Paphiopedilum, but as the former title does not indicate the relationship of the genus with others of the Cypripedellinae, the proposal is made that Cordula be dropped. "Contributions to the Flora of Burma" and "Miscellaneous Notes" conclude the issue.

Mr. G. F. Gardiner.—The Superintendent of the Botanic Gardens, The University, Bristol—Mr. G. F. Gardiner—commenced his gardening career at Pinewood, Witley, Surrey, the country seat of the late Lord Knutsford. After employment in the various departments of this garden for four years he, like many another young gardener, went to the Chelsea Nurseries

MR. G. F. GARDINER.

of Messrs. James Veitch and Son. Within a few months of his entering the famous nursery he was appointed deputy-foreman of the New Holland Plant Department, which position he held until he entered Kew in 1910. During the greater part of his stay at Kew, Mr. Gardiner had charge of the propagating houses of the Decorative Department, where most of the plants are propagated to furnish the big conservatory (No. 4 House). He attended the various courses of lectures and gained—in his year—the highest number of marks for systematic botany. In addition to studying botany at Kew, Mr. Gardiner attended courses on this subject at the South Western Polytechnic, Chelsea; the Richmond and Chiswick Polytechnics; and at Chelsea Physic Gardens. In October, 1912, Professor O. V. Darbishire, the head of the Botany Department at the University of Bristol, invited Mr. Gardiner to take charge of, and remodel, the Botanic Gardens attached to the University. This invitation was accepted, and Mr. Gardiner has held the position of Garden Superintendent ever since, with great credit to the University and himself. During the war, Mr. Gardiner was stationed in the Straits of Gibraltar as hydrophone operator, in the R.N.V.R., and whilst there made several excursions to "The Rock," to study the flora and collect seeds of uncommon plants. After demobilisation, he returned to the University. The Bristol Botanic Gardens are maintained solely for the purpose of supplying material for use in the lecture rooms and laboratories, for which

purpose a very large collection of greenhouse and hardy plants is cultivated. Mr. Gardiner lectures to the students on botanical gardening, and his duties include the collection and dispatch of seeds of a bewildering number of plants to the principal botanic gardens of the world.

Twenty-five Years of the Belgian Horticultural Federation.—Our Belgian contemporary, *La Tribune Horticole*, the organ of the Fédération des Sociétés Horticoles de Belgique, appeared in an enlarged form and on art paper on September 3, to celebrate the twenty-fifth anniversary of the foundation of the Federation. The Federation originally grew out of the Royal Horticultural Society of Huy, which was domiciled at Statte. This Society was one of the largest and most influential in Belgium, and still remains so; but its influence at the beginning of the present century was less than it should have been on account of the fact that its activities were purely local, and that no bond existed to connect it with the other Societies which worked in isolation all over the country. The disadvantages which arose from this isolation were fully realised by the Huy Society, and negotiations were opened up with the other societies with a view to forming a working association. A congress was held at Huy, at the office of the Society which had taken the initiative, on June 8 and 9, 1902. The delegates were formally welcomed at the Town Hall, and the Director-General of Agriculture, who was present, made a speech of welcome, after which he acted as President. An excellent spirit of agreement was displayed, and a resolution was passed with acclamation, forming the Federation of Horticultural Societies of Belgium, after which forty societies then and there declared their adhesion, many others doing so after reporting and consulting their local officials. The Constituent Assembly was held in Brussels on December 28, 1902, at which date 124 societies were affiliated. The late Count Oswald de Kerchove de Denterghem was asked to become the President of the newly constituted Federation, as it was felt that this would bring into line the Societies of Ghent and Brussels, which still held aloof. He did not, however, accept this invitation, fearing that his action might be misunderstood in certain quarters, and the question of the presidency was in abeyance until 1908, when the Count 't Kint de Roodenbeke was nominated President of Honor, and Baron Eugene de Kerchove d'Exaerde President effective. The first Secretary was M. Ch. Gonthier, of whom there is a good portrait (Pl. 465), and the first Treasurer, the Count de Villers. At first, the newly-born Federation suffered greatly for want of capital, and repeated applications to the Government for subsidies for this eminently useful and serviceable work were only poorly responded to. However, with the aid of generous donations from the affiliated societies, it gradually made its influence felt, and took its proper place among the horticultural institutions of the country, succeeding at last in its great object, the foundation of a separate department of State for horticulture alone—the "Office Horticole," now presided over by M. Hector van Orshoven, which has done so much for Belgian horticulture. Towards 1908, the office of the Federation was removed to Brussels, as it was found increasingly inconvenient to have the headquarters in a distant provincial town, when so much of the business had perforce to be done in the capital. Since then, with the exception of the war period, when its activities were necessarily restricted, the Federation has steadily grown in influence and usefulness, and can look back with unmixed pride on the record of its twenty-five years of existence.

Sweet Pea Essay Competition.—An essay competition has been arranged for members of the National Sweet Pea Society. The General Committee offers three prizes—first, £2 10s., second £1 10s., third, £1—for the three best essays on "My Sweet Pea Problems and Pleasures." The three prize essays will be published in the *Sweet Pea Annual* for 1928, and the Committee reserves the right to publish any of the others, wholly or in part, in future issues of the *Annual*. Essays must reach the

Secretary at 19, Bedford Chambers, Covent Garden, London, W.C.2, not later than Wednesday, October 19, 1927, and will be subject to the following conditions.—(1) Only members of the National Sweet Pea Society may compete; (2) Essays to consist of not fewer than 1,500 words nor more than 2,000 words in length, and be written or typed on one side only of the paper; (3) Essays must be signed with a nom-de-plume only and must reach the Secretary not later than October 19, 1927; (4) Envelopes must be marked "Essay" on the left-hand top corner and must contain a smaller, sealed envelope enclosing the nom-de-plume, name and address of the competitor (these smaller envelopes will be opened by the judges after the awards have been made); (5) All essays submitted will become the property of the National Sweet Pea Society.

The Melchet Court Vine.—There is a wonderful old vine of the Black Hamburgh Grape in Sir

Powerscourt, lilac lavender; Sunset, rose; Supreme, pale pink; Warrior, maroon; We nbley, pale lavender; Youth, picotee-edged; and 2 LO., scarlet-cerise.

Appointments for The Ensuing Week.—**SUNDAY, OCTOBER 2:** Wakefield and North of England Tulip Society's meeting. **MONDAY, OCTOBER 3:** Romsey Gardeners' Association's meeting. **TUESDAY, OCTOBER 4:** Bolton Horticultural Society's lecture; Royal Caledonian Horticultural Society's meeting. **WEDNESDAY, OCTOBER 5:** Nottingham and Notts. Chrysanthemum Society's meeting. **FRIDAY, OCTOBER 7:** Accrington and District Chrysanthemum Society's meeting; Dundee Horticultural Society's lecture; Manchester and North of England Orchid Society's meeting. **SATURDAY, OCTOBER 8:** British Mycological Society's autumn foray at Oxshott for London Students; Peebles Chrysanthemum show.

taken, flowered in September, 1790, at Smith's Nursery, at Dalston, near Hackney. This plant was then supposed to be about seventy years old, "at which time it displayed its 'scape,' or trunk, arising from the centre of the leaves, increasing with astonishing rapidity, until it reached nearly the height of thirty feet; resembling the mast of a ship, and there projected from its summit at proportionate distances thirteen great branches, at each of whose extremities were found from eighty to one hundred flowers, on proper peduncles or flower stalks of different lengths; that each flower might have its due position as to light and heat, exciting in the beholder the idea of a vast chandelier." It will be observed that the plant described by Thornton, though nearly twice the height of the one at Colebrookdale (which, by-the-bye, is said to be the first recorded to have flowered in Shropshire), has fewer branches; and although the average number of flowers on each branch is greater, the total

FIG. 118.—THE OLD BLACK HAMBURGH VINE AT MELCHET COURT, ROMSEY.

Alfred Mond's garden at Melchet Court, Romsey, Hampshire (Fig. 118). It has a trunk with a circumference of three feet three inches, and carries no fewer than eighty-six fruiting rods. The crop this season consists of over 650 bunches of excellent quality, several of them weighing over 4 lbs. each. We are indebted to Mr. W. Petty, gardener at Melchet Court, for the photograph from which the illustration is reproduced.

Sweet Peas for Garden Decoration.—The Floral Committee of the National Sweet Pea Society recommends the following twenty-four varieties of Sweet Peas as suitable for general garden cultivation:—Black Bess, blue-black; Bluebird, blue; Bonfire, bicolor; Charity, crimson; Charming, deep cerise; Delightful, pale cerise; Elegance, blush-lilac; Grenadier, scarlet-cerise; Ivory Picture, ivory; Joan Ryder, white; King Mauve, mauve; Magnet, deep cream-pink; Matchless, cream; Miss California, deep cream-pink; Mrs. Arnold Hitchcock, pale cream-pink; Olympia, purple; Picture, cream-pink;

"Gardeners' Chronicle" Seventy-five Years Ago.—*American Aloe in Bloom.*—There is now in flower at the White House, Colebrookdale, Salop (the seat of Mrs. Darby), a specimen of the *Agave americana*, or American Aloe, supposed to be above one hundred years old. The plant has thrown up two flowering stems, the largest sixteen feet, and the smaller one thirteen feet high. The larger stem has twenty-four branches, comprising from thirteen to 152 flowers on each; the smaller stem has eighteen branches, comprising from eleven to sixty-one flowers on each branch. As, from the great rarity of the flowering of the plant in this country, few have an opportunity of comparing one specimen with another, the following account, taken from Thornton's "Botany" (a book not accessible to everyone), may assist in forming some idea of the present plant. After mentioning that the Aloe was brought from South America into Spain, he states, that one is represented to have flowered at Lambeth, in 1690, and two other plants in 1714, at Hampton Court Palace; and that the one from which the representation given by him was

on all the branches is considerably less, the plant at Colebrookdale having on its main stem twenty-four branches, comprising 1515 flowers, and on its second stem eighteen branches, comprising 639 flowers; altogether forty-two branches, comprising 2,154 flowers. It is a curious coincidence (but nothing more) that the two stems together are about the height of the one described by Thornton. The gardener, with the permission of his employer, will have much pleasure in gratifying the curiosity of anyone who may be pleased to visit this "wonder of nature," in the course of the ensuing month. *W. G., Gard. Chron., October 2, 1852.*

Chipp; Oxford Forestry Memoirs, No. 7, 1927; both published by the Oxford University Press, Falcon Square, E.C.—*The Structure and Development of the Fungi*, by H. C. I. Gwynne-Vaughan and B. Barnes; Cambridge University Press, Fetter Lane, E.C.4; price 15/- net.

THE ORCHID HOUSES.

By J. T. BARKER, Dunstable, Bedfordshire.

Oncidium.—The members of this genus are usually represented in collections by plants in flower at all seasons. One very pretty, free-flowering species now in flower is *O. obryzatum*, its long and much-branched spikes carrying large quantities of pretty, golden-yellow flowers that are spotted light brown. The plants belonging to the *O. crispum* section, namely, *O. Forbesii*, *O. curtum*, *O. Gardneri*, *O. Marshallianum* and *O. crispum* itself, are most useful for supplying a display of bright flowers. *O. Marshallianum*, one of the most beautiful species, flowers during the late spring and early summer, whilst the others develop their beautiful and graceful flowering sprays during late summer and autumn. *O. varicosum* is one of the most beautiful and free-flowering Orchids in cultivation, and in the past has been grown in larger quantities than any other member of the genus. At the present time it is producing flower spikes which will be appreciated for shooting parties and other functions at a later date. The plants should be well exposed to the light in their growing quarters, and the spikes should be secured to neat stakes to prevent accidents. *O. ornithorhynchum* and its beautiful white variety *album*, with others that have been growing during the summer in the cool house, will be better wintered in a cool position in the intermediate house and watered according to their state of growth. There are many other *Oncidiums*, all of which are worthy of extended cultivation, especially where cut flowers are in demand. Unfortunately, there is a difficulty of obtaining some of the freest-flowering and easily cultivated varieties in quantity. After flowering, the plants should be rested, as these Orchids delight in a long, decided rest, but not the species which require fire-heat, or a moderate temperature; in no case should they be allowed to shrivel for the want of water.

Repotting.—Sometimes the cultivator has to decide between two evils, namely, repotting a plant at an unsuitable time, or allowing it to deteriorate in decomposed material. My advice in such cases is to repot, as no Orchid can succeed in such material, and more Orchids decline in health and vigour from this cause than any other. Some little discretion is necessary in the application of water to the roots of any plants repotted out of its normal season. The plants should be placed in the smallest receptacles that will accommodate them, and only sufficient material placed around them to hold them in position.

THE KITCHEN GARDEN.

By R. H. CROCKFORD, Gardener to THE RT. HON. LORD WAVERTREE, Horsley Hall, Gresford, N. Wales.

Carrots.—Maincrop Carrots that are fully grown should be lifted. The roots should be dug up carefully with a fork and laid in the sun for a short time before storing them. Cut off the foliage to about two inches or a little more from the crown, according to the nature of the variety, but by no means cut too closely to the crown or decay may set in. The roots should be placed in clamps or bins in a stove, with the crowns all showing outwards, and arranged in layers between sand or very old, sifted ashes. Carrots raised from seeds sown during early July are forming nice roots, and they should be thinned carefully for use as required.

Spring-sown Maincrop Onions.—Owing to the abnormally wet season, the bulbs of these Onions have in many instances larger necks than usual; such bulbs should be kept by themselves and used first. If not already done, the tops of all maincrop varieties should now

be bent over carefully in order to assist the ripening of the bulbs, and so soon as they are ready the latter should be pulled up and laid out thinly in the sun to ripen, turning them frequently. A better plan than to ripen them on the ground is to fix small-meshed wire-netting to wooden supports and place them on these, so that the air can circulate freely about them. If frames or airy glasshouses are available the Onions may be ripened in these. In any case, the bulbs should be well-ripened before they are stored.

Potatos.—Where the tubers have not yet been lifted they should be harvested without further delay. Disease is reported from all parts of the country, and special care should be exercised when gathering the tubers that only sound ones are stored. I would advise, where outside clamps are made, that a high and dry position be selected and extra means provided for ventilation. I again emphasize the use of a light sprinkling of lime when storing Potatos. It will be wise to examine the tubers already in store to make certain that they are sound, as we have found many which appeared perfectly sound when lifted showing signs of disease. To those fortunate enough to have plenty of shed room, I advise that as many Potatos as possible be stored therein, as it will be easy to make an examination of them during wet days, when outside work is impossible.

Celery.—About this time the earliest supplies of Celery are ready for use. Continue to blanch the later plants, either by enclosing the stems in paper or earthing them up; do not cover the tops of the hearts, or decay will follow quickly. Keep the crop free from pests; often in warm autumns this is very necessary. In earthing up use plenty of soot and lime as deterrents to insect pests.

Celeriac.—This vegetable is growing freely, and it will be wise to remove a few of the useless leaves from the crowns; at the same time, draw away a small portion of the soil from the roots. During showery weather a light sprinkling of guano between the plants, and well-hoed-in, will prove very beneficial in assisting the plants to make big roots.

FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P., Ford Manor, Lingfield, Surrey.

Strawberries.—Plants which were potted in July have filled their pots with roots, and a little weak liquid manure may be given them twice a week. Keep these plants out in the open; stand them well clear of each other, keep the pots free of weeds, pick off all runners as they appear and reduce the crowns to one. The weather has not been favourable to the ripening of the crowns and should it continue wet and dull, elevate the pots in order to expose the crowns as fully to the air and light as possible. The plants of later batches will have more time to develop and ripen their crowns in a more natural manner.

Melons.—These plants will require most careful treatment in watering the roots and promoting a suitable amount of atmospheric moisture. Plants carrying late fruits, now in various stages of growth, may be fed fairly liberally until the Melons have attained full size, when clear water only should be given in moderate quantity. Discontinue overhead syringing, as the moisture arising from the surface of the bed, floors and walls that have been damped will be found ample. Under this treatment the fruits will not exceed normal size, but will be sound, deep in the flesh, and of good average quality. A moderate supply of air should be admitted on fine mornings and gradually increased as the day temperature rises, when gentle warmth in the water-pipes will dry up superfluous moisture. The hot-beds on which later plants are growing should have fresh fermenting materials applied as linings so that the requisite temperature may be maintained. These plants will require still less water and moisture than those growing

over hot-air chambers. Expose the fruits fully to the sun and light, and cover the frames with mats at night, removing them first thing in the morning.

Vines.—Endeavour to ripen all late Grapes before damp, dull weather sets in. If necessary, give the roots a good watering and mulch them with dry material to retain the moisture in the soil. Gros Colman usually requires a long season, and when premature shrivelling of the foliage takes place it is well to allow a moderate amount of growth to develop. Owing to the dull, sunless summer, young vines will require a little fire-heat and plenty of fresh air to mature the wood thoroughly. Notwithstanding the excessive amount of rain, Grapes have coloured well and the berries are large. Remove all lateral growths and allow warm air to circulate freely amongst the vines. Pot vines having perfected their growth and shed their leaves, should be pruned so soon as they are ready and stood in a cool, airy position for forcing. Materials required for making fresh borders during the coming winter should be procured whilst the conditions are favourable.

Plums Coe's Golden Drop.—If the fruits are still hanging, the roots should be kept extra dry and the plants grown in an even temperature, ranging from 40° to 50°. If these conditions cannot be maintained the fruits had better be gathered, as when thoroughly ripened they will keep for some time in a dry room, provided they are carefully folded in silver paper. When the trees are cleared of the crop, moisten their roots prior to repotting the trees. Pots fourteen inches in diameter are large enough. Compost containing bones and concentrated fertilisers are best mixed before they are wanted. After potting them, the trees need not be kept in the house but stood in the open.

Figs.—The fruits having been harvested, trees in pots, tubs, or borders, should be rested. If the autumn is fine and dry, the pot trees may remain out in a sheltered position until the house or pit is ready for them. Pot Fig trees are subject to infestations of spider and scale insects and should be washed carefully with Gishurst Compound. The walls of the house in which they have been grown should be well cleansed with quicklime and sulphur. Sudden and severe autumn frosts are harmful to the trees, therefore the houses in which they will be wintered should be got ready for their reception. Pot trees may be obtained from nurserymen, and under good management improve with age. When the trees have been started into growth, the ball of roots, no matter how large, should never be allowed to become dry until all the fruits are gathered.

PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NALI-CAIN, Brocket Hall, Hertfordshire.

Euphorbia jacquiniæflora.—Where these plants have been grown in frames under cool conditions, they should be removed to a warmer house, for if allowed to remain too long in frames there is a possibility of some of the bottom leaves dropping. The plants should be arranged so that the full beauty of the long, arching growths of flowers may be appreciated, also the plants should, if possible, be stood facing the sun. Great care is needed in watering them; no stimulants of any description should be given until the pots are well-filled with roots, and even then it should be given in moderation. The same conditions apply to *Euphorbia pulcherrima*, better known in gardens as *Poinsettia*, but the latter should not be grown in a high temperature, otherwise the plants will become too tall; they are equally effective, whether they are two feet or six feet high, and it is simply a matter of growing them to suit requirements.

Humea elegans.—The plants should be shifted into fifty-four-sized pots and they will then be well established in the new compost before the short days of winter. These plants require careful treatment at all times, especially after they are transferred to larger receptacles. The plants should be absolutely in need of moisture before water is given them, then soak

the soil thoroughly. Grow the plants under the coolest conditions, near the roof-glass in a cool house, for any attempt to hasten the growth of this plant generally ends in failure.

Climbing Plants.—Climbers growing close to the roof-glass in the conservatory or greenhouse need attention at this time of the year to allow more light to reach the plants beneath them. Bougainvilleas may be cut fairly hard back when they have passed out of flower; other subjects, such as Cobaea, Passiflora and Tacsonia may be thinned severely. The present is an excellent time to wash the glass inside and out, and any blinds that have been used for shading may be taken down and stored in a dry place free from rats and mice.

Herbaceous Calceolarias.—It is advisable to establish these plants in their flowering pots during the present month. Use a light, rich, open compost, and see that the receptacles are well-drained. Care is needed not to pot too deeply; in fact, the old ball should not be covered with the new soil or the plant will be liable to rot off near the base. Grow the plants in the coolest possible conditions, just excluding frost from them, but prevent cold draughts reaching them and admit air only on the leeward side of the house. It is advisable to spray the plants occasionally with an insecticide to ward off attacks of aphids.

THE FLOWER GARDEN.

By JOHN COUTTS, Assistant Curator, Royal Botanic Gardens, Kew.

Planting Roses.—One of the most important details in the successful cultivation of Roses is early planting, and whenever possible they should be planted early in November. The beds should be prepared now to allow time for the soil to settle before the planting season arrives. Roses demand high cultivation, and the ground for them should be trenched at least from two-and-a-half feet to three feet in depth, as a deep root-run is essential. Heavy, wet land may require draining and the texture of the soil lightened by the addition of gritty material. On heavy soils stable manure should be used in preference to cow dung, the latter being best for light soils. When preparing the beds a dressing of bone-meal should be added and lime or basic slag forked into the surface, applying the slag at the rate of six to eight ounces per square yard. In certain conditions it may be necessary to remove the soil entirely and substitute good loam. Poor, light soils may be improved by removing a proportion of the sub-soil and substituting good loam. Most failures in the cultivation of Roses are usually due to poor cultivation; it therefore pays to prepare the beds thoroughly in the beginning. Orders for new Roses should be placed early and thus ensure them being delivered in good time. Much depends on a selection of suitable varieties, and it is always best to see the plants growing in the nursery, as varieties that may attract on the show benches may prove to be poor growers. Before planting any untried variety in quantity, it is wise to test it for a season at least to prove its value for one's particular purpose and garden.

Border Carnations.—Shoots that were layered at the proper time should now be well rooted, and they should be planted in their flowering quarters as early in October as possible. Carnations planted early in autumn do much better than when they are potted and wintered in frames to be put out in spring, although in very damp, low-lying situations wintering them under glass may be necessary. The beds should be well dug and the soil enriched with well rotted manure; before planting, a sprinkling of lime should be forked into the surface. In wet situations the beds or borders should be raised somewhat above the general level. Plant when the ground is in good working condition as the soil should be trodden fairly firmly. Carnations should be handled carefully when planting them as the "tongue" with the attached roots is very easily broken off. It is wise to place some of the plants in a sheltered position, or transfer them to pots, in case of any failing during the winter.

HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD, Wrotham Park, Barnet, Middlesex.

Raspberry Beds.—If not already done, cut out all the old fruiting canes to admit light and air to the young canes that are to yield next season's crop. Reduce the number of the young growths leaving only sufficient to furnish the trellises at a reasonable distance apart. If planted in rows, a distance of six inches or eight inches apart will be suitable. Fasten the canes loosely to the wires with soft tar yarn and little if any further attention will be required, beyond keeping the plantation clean.

Pears.—Examine the trees and gather the largest and most forward fruits, which should be placed in a fruit room to complete their ripening. If it is desired to hasten their ripening, place them in boxes in a warm greenhouse or vinery. Do not gather late varieties for the present as these are best left on the trees to mature. Nouvelle Fulvie, Glou Morceau, Josephine de Malines, Beurré Perran, Le Lectier and Ne Plus Meuris are all good late varieties of Pears.

FIG. 119.—RHOËO DISCOLOR.
(see p. 264).

Nuts.—The crop of nuts was very promising early in the season, but of late a large number of the nuts have fallen from the bushes without kernels. Most nut trees developed plenty of female blooms and large quantities of catkins, but late frosts destroyed most of the catkins, and this may be the cause of the loss. Keep a watchful eye on those left, for rats and mice, if not checked, will carry away large quantities of the nuts in a few nights. Nuts may be planted where other fruits would fail. Kentish Filbert and Prolific Filbert are two early and dependable varieties. Kentish Cob and Webb's Prize Cob are much grown in some parts of the country.

Loganberry.—This useful fruit requires but little care and attention when once established, for its cultivation is very simple. So soon as the fruits have been gathered, cut out all the old fruiting shoots and train the young growths in their places. If the soil is in good heart and the young growths robust, little if any feeding will be needed, but on poor, light land, heavy mulchings and liberal feeding will greatly assist the plants. The Loganberry may be grown in a variety of positions and may be used to cover old walls, or it may be trained on trellises or poles.

FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF AILSA, Culzean Castle, Maybole, Ayrshire.

Propagating Shrubs.—After the various bedding plants have been propagated, many kinds of hardy and half-hardy shrubs may be readily increased in a like manner, and when cuttings of these are available they should be inserted in spare frames prepared as advised for the reception of the other cuttings. To name all the varieties which may be thus increased would make a long list; among others Veronica, Escallonia, Tricuspidaria, Choisya, Olearia, Fuchsia, and Myrtus may be propagated successfully at this time, and under favourable conditions the plants will be ready to remove to a nursery border early in spring. Shade and moisture are essential for the success of these more or less hard-wooded subjects, and they should never be allowed to wilt for want of moisture. Where only a few plants of each are required the cuttings may be inserted along the bottom side of the frames containing the bedding subjects, that is, in the part shaded by the front of the frames, where, as a rule, other things do not do so well. It will be found that they will root with greater freedom than in a lighter position. The method of striking a few cuttings in pots of sandy soil, and plunging the pots to their rims in any moisture-retaining material is also a good plan, as when treated in this way, they are easily removed to other quarters should the necessity arise, without actually disturbing the young, partially-rooted plants.

Michaelmas Daisies.—These beautiful autumn flowers are making the borders gay, and where the number of shoots was reduced and the plants staked to prevent them becoming twisted or bent down, in good time, the reward of the labour involved is now apparent. The dwarfier forms, such as A. Amellus and its numerous varieties, and, together with the graceful A. ericoides, are usefully employed in the front of the taller varieties. These two types of the plants, however, do not increase so rapidly as many others; and where it is desired to have more of them, one or two old plants should be lifted so soon as they have finished flowering, cut over six inches above the ground, and carefully pulled to pieces, leaving at least one of the old flowering stems to each piece. These divided portions should be planted about four inches apart in good soil in a frame. They will form useful specimens next season, and if planted in clumps of seven or more, will provide quantities of cut flowers, as well as keep the front of the borders well furnished at a time when flowers are getting scarce.

MESEMBRYANTHEMUM.

(Continued from p. 228.)

FENESTRARIA, N. E. Br.

As the two species of this genus can scarcely be distinguished by their leaves, and as they have now both flowered in Europe, the following brief descriptions of their flowers may be useful for discriminating them until more complete descriptions can be given at a later date.

F. aurantiaca, N. E. Br.—Corolla 2½–3 inches in diameter; petals about 50, in one series, 12–15 lines long, and 1 line broad, obtuse, of a somewhat orange-yellow with a pinkish tinge on the back; shining. Stigmas very plumose, white.

This beautiful species is the type of the genus.

F. rhopalophylla N. E. Br.—Corolla 1½–1¾ inch in diameter; petals about 35, in one series, 8–9 lines long, ¾–1 line broad, obtusely pointed, white. Stigmas filiform, acute, not plumose, pale yellowish-green.—Mesembryanthemum rhopalophyllum, Schlecht and Diels in Schultze, *Aus Namaland und Kalahari* p. 83, with fig. and p. 692; Marloth, *Flora of South Africa*, Vol. I, p. 207, t. 52.

Both species are natives of Namaqualand. N. E. Brown.

(To be continued).

INDOOR PLANTS.

RHOEO DISCOLOR.

At one time this plant was popularly known as *Tradescantia discolor*, but it has since been placed in a separate genus, of which it is probably the only species in cultivation.

The illustration reproduced in Fig. 119, on p. 263, clearly portrays the upright habit of the plant, in striking contrast to that of *Tradescantia*. A shoot of the well-known garden plant, *T. zebrina variegata* (*Zebrina pendula* of botanists) has been placed on the pot for comparison. The texture and colouring of *R. discolor* is identical with that of the *Tradescantia*, the upper surface of the leaves being of a bright, glossy green, whilst the undersides are deep purple. The leaves are about one foot in length and two inches in diameter, and as both surfaces are exposed to view, the plant is very conspicuous and decorative.

The inflorescence is composed of small, white blossoms which are inconspicuous, but the two large bracts which surround them are very attractive in shape and colouring. These two bright purple bracts are so formed that they overlap and form a large, boat-shaped structure, about an inch deep and an inch-and-a-half in length.

Being a native of Brazil, *R. discolor* requires the shelter of a warm greenhouse, otherwise its cultural requirements are simple, a compost of three parts loam, one part leaf-mould, and a sprinkling of sand, being quite adequate.

Propagation is easily effected by means of seeds, while suckers may be detached from the base and rooted in sandy soil, in a warm propagating case, with perfect ease.

[A fine illustration of *R. discolor*, showing the purple colour of the lower leaf-surface, will be found in *Bot. Mag.*, t. 1192, where it is described as *Tradescantia discolor* "brought from the countries bordering the Gulf of Mexico to Jamaica, whence it has been imported into this country. Requires to be kept in a stove. Propagates abundantly, both by offsets and seed. Of easy culture. Our drawing was made from a plant that bloomed last February in Mr. Vere's hothouse at Kensington Gore." The date on the *Bot. Mag.* plate is May 1, 1809.—Eds.]

ERYTHRINA CRISTA-GALLI.

ALTHOUGH this species was introduced more than three hundred years ago, it is by no means common, albeit most botanical gardens have it in their collections. The Latin name of the genus is derived from *erythros*, red, in reference to the flowers, which are of a vivid scarlet colour. These large, Pea-shaped blossoms—the plant belongs to the Leguminosae—are produced in June on immense racemes at the ends of stout, prickly stems that rise from four to six feet.

In the south of England the Coral Tree may be grown entirely out of doors, provided it is planted in a well-drained position, such as under the shelter of a wall with a south aspect. There used to be a fine specimen of this plant growing at the base of a greenhouse wall in the Chelsea Nursery of Messrs. James Veitch and Sons. It was apparently growing in the gravel path, where it made remarkable growth and blossomed profusely each year. Nothing was ever done to it, with the exception of giving it an annual pruning, which consisted in cutting back the old flowering stems, close to the ground. It was not protected in any way, even in the depth of the winter, which proves, that given the right conditions, it may be classed as a hardy plant, although its native habitat is Brazil.

As a pot plant for a large conservatory, *Erythrina Crista-galli* is very useful, because it responds readily to artificial heat, and may be made to bloom in the early spring, with a very little trouble. Plants for forcing should be potted in November and the shoots pruned back close to the base. Forcing should, of course, be accomplished by gradual stages, and great care should be taken to keep the foliage free from red spider by frequently syringing it. Under this treatment it may be flowered freely

in March, when its brilliant blossoms are much appreciated.

This species is, fortunately, easy to propagate, so that a stock of plants may be acquired quickly. Young shoots, about three inches in length, root readily in sandy soil, if placed in a propagator with a bottom heat under a bell jar. *G. F. Gardiner, Botanic Gardens, University of Bristol.*

ORCHID NOTES AND GLEANINGS.

LEPTOTES BICOLOR.

THIS pretty little Orchid should be grown in shallow pans or in small, teak-wood baskets, and suspended from the rafters of the intermediate house; A.1 fibre and a little Sphagnum-moss will provide a satisfactory rooting-medium.

L. bicolor—sometimes referred to *Tetramicra bicolor*—was introduced from the Organ Mountains by Mrs. Arnold Harrison, of Liverpool, in 1831 or 1832; the first plant to bloom in this country, however, was collected by Gardner in the same region and sent to Woburn, where it flowered in 1839.

The rhizome is creeping, and from it develop several terete stems, one inch to one-and-a-half inch long; the leaves are fleshy, recurved and grooved on the upper side; deep green, sometimes suffused or spotted with dull purple. The peduncles appear from the bases of the leaves and are two to four-flowered; the sepals and petals are white; the lip is shorter than the other segments, oval-oblong, with two auricles; purple, sometimes tipped white.

This small, neat and very pretty plant produces its flowers in winter; I have known it grow admirably in a cool house, placed at the warmer end. This Orchid requires a liberal supply of water in the growing season. *Ralph E. Arnold.*

TREES AND SHRUBS.

GAULTHERIA NUMMULARIODES.

THIS is one of the most charming members of the genus, and a shrub of such remarkable distinction that it is not likely to be confused with any other. It does well with me on a cool and shady woodland slope set with sunken stones, the soil being light and gritty, but intermixed with a little leaf-mould at planting time. Half-a-dozen plants put into this bank a few years ago have now covered the whole space, running beneath the stones, and sending up graceful tufts of the long, drooping branches, which are closely set with almost round, opposite leaves. The latter, growing smaller towards the tips, give the Fern-like foliage a finely-tapered appearance. The leaves are leathery in texture, and an attractive moss-green; the bristles which clothe their margins and undersides as well as the branches give the plant a rusty-brown hue.

The pink, bell-shaped flowers are produced freely under the leaf axils during the late summer, but none of these have ever yet set fruits, and it would be interesting to know whether other growers of this choice *Gaultheria* have been successful in fruiting it.

Though a native of the Himalayas, *G. nummularioides* has never suffered injury from frost here, and 15° are not infrequent. Judging from my experience, there seems no doubt but that this *Gaultheria* delights in just such spots as those in which hardy Ferns prosper.

RUBUS IRENAEUS.

I HAVE grown this *Rubus* for some years as a ground covering under trees in a woodland garden and it has given every satisfaction. A native of western and central China, where it grows in forests at considerable elevations (up to 8,000 feet), *R. irenaeus* was introduced by

Mr. E. H. Wilson for Messrs. J. Veitch and Sons in 1900. It is a quite prostrate, trailing species, the well-rounded leaves, some six inches across being a rich, burnished green, and much like those of *Galax aphylla* in their colour and gloss. The underparts of these leaves, which stand well up on five-inch to six-inch stalks, are slightly tinted with a yellowish-brown felt, but I find that this is all but absent when the plant is in full shade. The flowers, which are white and cup-shaped, are borne in clusters from the leaf axils during the later summer, but these have not yet ripened fruit in this garden. *R. irenaeus* is a rapid trailer and, being evergreen, it always looks well in woodland undergrowth. The stems are armed with a few, small decurved prickles. *A. T. J.*

PLAGIANTHUS BETULINUS.

WITHOUT any pretensions to the fine qualities of *P. Lyallii*, this species is a very interesting shrub or small tree, and is worthy of a place in every good garden.

It is a tall-growing species, very like a Birch in foliage and growth. It makes a choice and conspicuous tree for a sheltered situation.

The flowers are small, on slender pedicels, but here, in Gloucestershire, the plant flowers but rarely; the panicles are terminal, branched, many-flowered and produced in summer.

The leaves of young plants are small, about half-an-inch long, rounded-ovate, crenate and lobed. In a full grown specimen, the leaves are about two inches long, ovate, acuminate, rounded at the base and coarsely serrate.

In its native place, *P. betulinus* will reach a height of from forty feet to seventy feet; it was introduced from New Zealand in 1870, and is still somewhat rare in gardens.

The shelter of a wall is advisable, and in a large border of choice shrubs in such a position a plant of this *Plagianthus* is a fine feature, its foliage alone being a striking foil to more colourful subjects. *Ralph E. Arnold, Campden, Gloucestershire.*

ALPINE GARDEN.

SCUTELLARIA ALPINA.

SCUTELLARIA alpina is but seldom seen in gardens nowadays, yet some forty years or so ago, it was more popular. The species is a native of Switzerland and common by the waysides near Mount Cenis. *S. alpina* is of a trailing habit and only grows a few inches above the soil. It bears whorls of violet and white blooms, the white of the lips contrasting pleasingly with the violet of the hoods.

This alpine Skullcap is a wonderfully accommodating plant in the garden, but it needs a sunny place and a rather light, warm soil. It may be raised from seeds or increased by cuttings or division.

ERODIUM MACRADENUM.

THE genus *Erodium* presents us with so many charming plants for the rock garden that it is exceedingly difficult to select one for notice without seeming to do injustice to the other species. Nothing of this kind is intended in referring to *Erodium macradenum*, which is chosen for notice, not as the most delightful of the genus—for one would not hazard such a statement—but simply as one of a beautiful race which may well be included in any rock garden. It is one of the best of our rock plants, and deserves a good place in loam, leaf-soil and peat, and a sunny position. It is only from four inches to six inches high, and forms an exceedingly pretty tuft of green foliage—not downy, as that of most other species. This foliage is cut in a charming way and adds greatly to the charm of the pink flowers.

Each of the two upper petals, which are smaller than the lower, has a black blotch which gives a distinction to the blooms and an additional grace to the general effect. This Pyrenean Heron's Bill is quite hardy under reasonable

conditions, and is entirely worthy of one of the best positions in the rock garden or small rockery. It is increased by means of seeds or cuttings. It prefers lime, though this is not essential.

STACHYS CORSICA.

Stachys corsica is one of the most delightful of rock garden plants. It forms a close carpet of small, shining green leaves, which all the summer through is almost covered with little flowers. The blossoms open white, then pass to blush. It is a delightful carpet for choice early bulbs, such as rare Snowdrops, and is never obtrusive. Although it spreads freely in light, well-drained soil, it is not rampant like so many other creeping plants, and is easily kept within bounds.

S. corsica is, generally speaking, hardy. Mr. Reginald Farrer stated that it was "faithfully" hardy, but I am sorry to confess that I almost lost it one wet winter, although it was in an exceptionally dry and well-drained position. The combinations of weather that season were no doubt, exceptionally trying, but in a climate such as this with a heavy early winter rainfall, I think it should be protected by a sheet of glass. I prefer to plant either very early in autumn or in spring, and find that the plant does best on a sunny part of the rock garden or almost on the level. *S. corsica* also flourishes in the moraine. It is readily multiplied by division, and may also be raised from seeds. *S. Arnott*.

CYANANTHUS LOBATUS AND C. INCANUS.

No rock garden is complete without at least one of the members of the exquisite genus *Cyananthus*. *C. lobatus* is a pretty Himalayan species, about four inches in height and of a somewhat prostrate habit. The flowers are bright purplish blue with a whitish centre, composed of fine white hairs.

C. incanus, from Sikkim, is a much rarer plant and somewhat delicate, although it flowers more freely than the species under notice, but the blooms are somewhat smaller in size, yet decidedly more beautiful in that they are of a delightful soft azure blue with the throat of the corolla tube lined with white hairs.

Both members of the genus delight to ramble in a deep compost of leaf-mould and sand in a semi-shaded nook. Propagation may easily be effected by means of cuttings inserted in early summer or in spring and struck in sandy peat. The plants may be divided in spring, but the latter method is not to be recommended. *T. D. Boyd*.

HARDY FLOWER BORDER.

HERBACEOUS PAEONIES.

In the beautiful gardens of a very old ancestral home there is a splendid collection of herbaceous Paeonies, and I have been impressed this year more than ever before by the value of the species as an item of garden decoration. For the embellishment of rooms the Paeony is well adapted, especially if the rooms are of considerable size.

My plants are growing in a border which is said to have been planned by the renowned Capability Brown. Amongst the double forms I regard *Chrysolithe* as one of the best; the outer petals are a clear flesh colour, while the centre petals are yellow—a really delightful combination. *Lamartine* is salmon-coloured, and its flowers are full and very freely produced. *Madonna* is the essence of refinement; the ground colour of the petals is the purest white, shot with delicate primrose and copper tints. *Francois Ortegat* has much the appearance of an old cottage garden Paeony, and a good deal that is not to be found in that charming old-fashioned flower; the colour is deeper for example, and the flowers are thrown well above the foliage.

Herbaceous Paeonies with a purple pigment in the flowers are not very popular because there is something indecisive about the colour of most

of them. The variety *Constance Devered* is an exception, however. Its flowers are a clear purple-violet and they are of a good size. Though they are disliked by some florists, single Paeonies have a great following and they are being improved every year. The variety *Dog Rose*, for example, never needs to beg for notice. It reminds one of a very much enlarged *Dog Rose* of the hedgerows. The beautiful bright pink flowers are borne very profusely.

The variety *Snowdrift* has a very appropriate name, for the flowers are as white as drifted snow. The variety is one of the earliest to open.

Dr. Andre is a variety of the bi-coloured type and in my judgment, the best of the single bicolors. The centre of the flowers is yellow, the circumference a beautiful creamy white.

during April or early May in a fairly good loam enriched with leaf-soil and manure, and not allowed to suffer from want of water during drought, success is assured. The colours range from white to brilliant scarlet, with many beautiful intermediate shades of soft pink, rose to carmine, and purplish-lilac, and the flowers are carried on stout and prettily-branched pyramidal stems two feet tall. The flowering period is from June to September.

George Home is one of the finest scarlet varieties; *Lady Mary Kidd*, the finest white; while *Pink Pearl* is a delightful shade of rosy-pink, and most effective. Massed in beds of moderate size, *Chester Scarlet*, *Newbury Gem*, *Southgate Surprise* and *Southgate Gem* give effective shades of crimson-scarlet, and are smothered with long, graceful spikes of brilliant

FIG. 120.—LATHYRUS NERVOSUS AT THE LAWS.

I have not seen a finer crimson single Paeony than *Imperial Queen*. The individual flowers are large and freely produced.

The border in which my plants are growing faces due south, being protected from the north by a ten-foot wall. The soil is a rich loam, with a balance on the heavy side, and our rainfall is between forty and forty-five inches per annum. In these conditions the plants thrive amazingly. All the above varieties produce healthy, vigorous growth and develop their flowers well above the leaves. Doubtless some of them are fragrant, which must add to their charm. I am unable to speak of their fragrance, however, because a serious motor accident some years ago deprived me of the power to smell—a real deprivation to a gardener. *George H. Copley, N.D.H.*

PENTSTEMONS.

For general effectiveness in the garden during late summer and autumn, the Pentstemons are almost impossible to beat. If planted out

flowers until late autumn. Pentstemons are easily increased by cuttings taken in August and September, or from seeds. *W. Logan*.

PLANTS NEW OR NOTEWORTHY.

LATHYRUS NERVOSUS.

REFERRING to the article which appeared in *The Gardeners' Chronicle* of May 7, giving the history of Lord Anson's Pea, *Lathyrus nervosus*, it is just possible that the enclosed photograph of it (Fig. 120) may interest you.

I may state that at The Laws we have had no difficulty in bringing this Pea through the winter in the open, and with only a few light Spruce branches as protection. The plant of which I send you the photograph had twenty-four flowering stems on it at the middle of June. *Fred. D. Stewart Sandeman, The Laws, Kingennie, Forfarshire.*

BULB GARDEN.

HYACINTHUS AZUREUS.

Coming before the Grape Hyacinths, or Muscari, among which it is frequently placed under the title of Muscari azureum, Hyacinthus azureus is welcomed by all lovers of early flowers, even though not of commanding stature or of brilliant effect. It is by far too little known, which is not surprising in view of the fact that it so closely resembles the Muscari that it shares the general indifference to the charms of these little flowers—an indifference far from deserved. A mass of Hyacinthus azureus, thinly planted among Snowdrops, forms a delightful picture in grass or in the rock garden, when they flower together, as they frequently do. This year H. azureus tarried long with me and the earlier Snowdrops were nigh over before the azure cones of the Hyacinth reared their heads. Even though they missed the desired combination, I had another, composed of H. azureus and Tulipa Kaufmanniana, but the colour effect attained is better if the common blue Grape Hyacinth, Muscari botryoides, is planted along with H. azureus and the Tulip. Some of the very earliest Daffodils may also be employed; and there is nothing finer than a carpet of H. azureus or M. botryoides with Narcissus pallidus praecox, in its earliest forms, flowering above it. H. azureus is now comparatively inexpensive and should be planted in generous groups in a warm, sheltered place, as, although perfectly hardy, its blooms are sometimes disfigured by severe frosts. It is exquisite with its blue bells arranged in little cones, with their lower flowers drooping and the upper ones densely crowded together; it is only about six inches high when in flower. In passing, it may be remarked that H. azureus differs from Muscari by having an open mouth to the flower.

In addition to the typical form, there are a few varieties. Of these H. a. amphibolis appears to be the only one in commerce at present. It is a little earlier in blooming than the type, and has lighter-coloured flowers. What appears to be a very fine form is that called H. a. giganteus, from north Cilicia, which was figured in *The Gardeners' Chronicle*, September 10, 1898, Fig. 52. I do not think that this is in commerce but both it and the larger robustus would be acquisitions were they available.

A light, rather gritty soil evidently suits these flowers, which increase well by offsets. With me they come too early to produce seeds. The type and varieties are natives of Asia Minor. S. Arnott.

NOTICE OF BOOKS.

Trees and Shrubs at Westonbirt.*

THE publication of a sumptuous catalogue of the trees and shrubs at Westonbirt has a mournful interest for many of us, inasmuch as he who designed it and followed its preparation with so much interest passed away before it was ready for the press. Sir George Holford's death brought irresistibly to mind the warning penned by Horace well nigh two thousand years ago:

*neque harum qua colis arborum
Te, praeter invida cupressus,
Utta brevem dominum sequetur.*

Lines which may be thus rendered in paraphrase

With all the trees that thou hast tended,

The brief cynosure is well nigh ended;

Except the Cypress—that may wave

A sombre tribute o'er thy grave.

The collection at Westonbirt owes its richness and variety to the intelligent enthusiasm of father and son—of Mr. R. S. Holford, who succeeded to Westonbirt in 1839, and died in 1892, and of Sir George Holford, whose loss very many friends and all good arboriculturists must deeply deplore. By these two owners these

woods and gardens have been carefully tended for more than eighty years, and the difficulty presented by an oolitic soil with limestone brash, so unfavourable to the cultivation of many families of plants, has been skilfully overcome. Such soil must have proved fatal to Rhododendrons; but, fortunately, a tract of acid loam lies about half-a-mile from the mansion and this was laid out as an arboretum by Mr. Holford. Here, and in the adjoining woodland, extending to some 400 acres, Sir George was able to grow successfully very many of the Asiatic Rhododendrons which have been introduced in recent years in such bewildering profusion.

Catalogues, as a rule, cannot take high rank as literature, but Mr. Bruce Jackson must be congratulated on having made this one of more than common interest. It contains many notes of interest for gardeners and amateurs, who will find recorded the behaviour of a vast variety of vegetation—ranging from lordly Abies grandis, 106 feet high, down to Hypericum Moserianum of humble stature. But what lend to this volume its chief dignity are the fine plates enriching it. Excellent portraits of Sir George Holford and his father are placed as a double frontispiece, while reproductions of photographs of fine trees and shrubs and of garden scenery will convey to those who have never visited Westonbirt some notion of what has been accomplished in converting flat, arable fields, with hedgerow timber, into a veritable paradise. Mr. Bruce Jackson has prepared what will serve as memorial alike of a notable achievement in arboriculture and of the kindly English gentleman who carried it to fulfilment. Herbert Maxwell, Monreith.

PERFORMANCE OF A CONTRACT AND REMEDIES FOR BREACH OF CONTRACT.

HAVING considered the subject of contracts from many aspects, how they are made, the various parts and their particular forms, we have yet to discover how to enforce a contract and what remedies are given by the law to anyone who suffers a loss as the result of a breach of contract.

The first and general rule is that it is the duty of the seller to deliver the goods, and of the buyer to accept and pay for them in accordance with the terms of the contract. Delivery and payment are, unless otherwise agreed, concurrent conditions, thus the seller must hand over the goods in exchange for his money and vice versa.

To this general rule there are various sub-rules which are very useful to remember. The first of these deals with the case where either more or less goods than ordered are sent. The question arises: what should the buyer do? The answer is found in the rule that where the seller delivers a quantity of goods less than he contracted to sell, the buyer may refuse to take them, but if he accepts them as delivered he will have to pay for them at the contract rate. Where a larger quantity of goods than ordered is delivered, the buyer has three courses open to him. He can either reject the whole, or he can take those goods included in the contract and reject the rest, or he can, if he likes, accept the whole of the goods delivered and pay for them at the contract rate.

Again, where goods which were contracted for are delivered mixed with goods not included in the contract, the buyer can either take those which are in accordance with the contract and reject the rest, or he can refuse to take any of them.

THE SELLER'S RIGHTS.

Where the seller has parted with his goods and has failed to get the price, his remedy is to bring an action against the buyer for the amount due; it will nearly always be possible to do this in the local County Court, and a visit to the County Court Office will set the machinery in working order. If the goods are still in the seller's possession, they can be retained until

the money is forthcoming, unless, of course, there is any stipulation in the contract providing for the delivery before payment.

As regards re-selling the goods, this can be done if they are of a perishable nature, or after notice of intention to re-sell has been given to the buyer and he has failed to tender the price within a reasonable time. In such cases the seller may re-sell the goods and recover from the original buyer any loss occasioned by the latter's breach of contract.

Where the buyer refuses to accept the goods the seller can recover damages from him for non-acceptance—these will usually be the difference between the contract price and the market price when the goods ought to have been accepted.

Lastly, it should be mentioned that when the price is payable on a certain day, irrespective of delivery, and it is not so paid, the seller may maintain an action for the price, although the goods are still in his possession.

Where the seller refuses to deliver the goods, the buyer can bring an action against him claiming damages for non-delivery; these damages are generally estimated as the difference between the contract price and the price when the goods ought to have been delivered. The buyer has also the right to ask the Court to order the seller to deliver the goods as contracted, this remedy, however, is not often given in the case of sale of goods, although it is the usual redress in the case of sales of land. Harold Sharman.

AMERICAN NOTES.

HIBISCUS MOSCHEUTOS VAR. CRIMSON EYE.

GROWING beside a stream which wanders through marshy ground forming an outlying portion of Greystone Estate, Yonkers, New York, are several plants of this beautiful Marsh Mallow, and during the latter part of August they made a fine display with their large, pure white flowers, each marked with a deep crimson eye, while the presence of numerous buds promised a continuous display for some time to come.

According to Bailey, there is some doubt as to whether or not this plant is specifically identical with Hibiscus Moscheutos. He suggests it may be H. oculiroseus, but admits its resemblance to H. Moscheutos. It was discovered growing in a swamp in New Jersey, and was introduced to commerce about thirty-three years ago.

The plants in question form quite large clumps with numerous, erect, herbaceous stems, four feet to five feet in height. The leaves are pointedly ovate, with long petioles, and a blade four inches to five inches in length, and almost as broad at its greatest measurement. Some of the leaves are slightly tri-lobed towards the apex, and the leaf margins are crenately toothed. The upper surface is almost glabrous and of a deep green hue, suffused with a bronze tinge, while the under surface is very softly tomentose and of a much paler colour.

From the axils of the upper leaves the solitary flowers are produced on peduncles one-and-a-half inch in length. They are widely expanded and measure five inches or more in diameter. Each of the five strongly-nerved, ivory-white petals is of good texture, and marked with a vivid crimson blotch at the base on the inner side.

As a late blooming subject for a moist situation this Hibiscus has much to commend it, while on fairly retentive soils it will flourish away from the water side and may with advantage be planted to enhance the beauty of the herbaceous border.

IMPATIENS BIFLORA.

IMPATIENS biflora, or the Jewel Weed, as it is called in North America, merits its popular name from the rich, orange-coloured flowers depending on slender pedicels from the leaf-axils, suggesting pendent ear-rings set with precious stones. Perhaps this is a flight of fancy, but certainly no lover of the beautiful

* Catalogue of the Trees and Shrubs in the Collection of the late Lieut.-Col. Sir George Lindsay Holford, K.C.V.O., C.I.E., C.B.E. Compiled by A. Bruce Jackson, A.L.S., Oxford, at the University Press: London, Humphrey Milford, 1927. Price £4 4s. net.

will deny that a mass of this plant in bloom growing on the fringe of a wood or in an open woodland glade, makes an exquisite picture; the effect is very enhanced when the contrast between the bright flowers and the pale green leafage is heightened by rays of sunlight streaming through the overhead canopy.

As the rather sappy growth suggests, *Impatiens biflora* is a lover of moisture, and is only found in marshy situations or by the water-side. Although it frequently grows in shady woodlands, it is equally at home in full sun, provided the requisite soil-moisture is present.

In favourable situations the Jewel Weed attains a height of five feet or more, and the stems branch in a characteristically graceful fashion, exhibiting to the best advantage the full beauty of the flowers. These latter are borne, usually, in pairs on slender pedicels from the axils of the upper leaves. Occasionally the flowers are solitary, and sometimes three together. The spur, which forms the throat of the flower, is broad and about one inch in length, the measurement across the mouth of the flower being about the same. The ground colour is a warm orange-yellow, marked on the lip and on the underside of the spur with dark orange-red blotches, in much the same way as are some of the herbaceous *Calceolarias*. The amount of this blotching varies considerably with individual plants; in some only a few spots appear on the inside of the throat, while in others the whole of the upper and lower lips are covered with the darker markings.

As a subject for sowing in moist places in the wilder portions of the garden *Impatiens biflora* is worth a trial, but as it seeds very freely and the seeds are dispersed in the characteristic manner which has earned for *Impatiens* the name of "Touch-me-Not," it should not be grown where self-sown seedlings are likely to be troublesome.

Impatiens biflora is closely related to the native British *Impatiens Noli-tangere*; it has been introduced to Britain and is now quite naturalised in several places, notably along the Thames and some of its tributaries. So sensitive is the Jewel Weed to lack of moisture that if cut in warm weather and left out of water for only a few minutes the foliage withers never to recover.

WATERING IN AN AMERICAN GREENHOUSE.

FOLLOWING the usual practice in American gardens, practically all the watering necessary in the hot-houses and greenhouses on the Greystone Estate, Yonkers, New York, is performed with the aid of hosepipes. To the uninitiated this will undoubtedly seem to be a sloppy and unsatisfactory method of carrying out an important task, but, contrary to expectations, it proves highly efficient in practice, for it must be remembered that everything dries up much more rapidly here than in Britain, and even in winter time foliage, soil and stages are not liable to lie sodden for long periods as would be the case at home. Indeed, when the rapidity with which plants dry out and the relative high cost of labour are taken into account, it will be realised that any other system would be impracticable where large quantities of pot plants, fruits, Roses, Carnations, cut flowers, etc., have to be produced. Consequently, everything except Orchids and very small seedlings are watered with a hose, the flow from the hose-pipe being so regulated of course that it is no more than that obtained from the spout of an ordinary watering can.

In the largest range of glass—a range comprising thirty-one modern glasshouses and a connecting corridor, an ingenious and excellent system is installed, whereby it is possible, by turning various taps, to obtain through the hosepipe cold water, hot water or liquid manure or any two, or all three, mixed in such proportions as may be required. The cold water is obtained from the ordinary city mains and the hot water from the same source after passing through a boiler. In order to obtain the liquid manure under pressure, a special apparatus is installed, as the tank containing it is situated at a considerably lower elevation than the range of glasshouses. This tank, or rather, these tanks—for a dividing wall exists which makes it

possible to store rain-water in one compartment and liquid manure in the other—are built of concrete and are of large capacity. Across the top of the dividing wall is fixed an electric pump with two intake pipes, one entering the rainwater tank and the other the liquid manure tank. A wire gauze screen prevents solid matter from entering and choking the feed pipe in the latter case. By means of regulating valves it is possible to obtain either the rainwater or the liquid manure under pressure.

Another essential feature of the system is a closed, cylindrical steel pressure tank, which is so arranged that when the pressure falls below 25 lbs. to the square inch an automatic switch is brought into operation, and the electric pump commences to work and continues until the pressure is brought up to 50 lbs. to the square inch, when the switch automatically cuts off the current and thus stops the pump. By this means a pressure is always maintained and the apparatus requires practically no attention. The cold water, hot water and liquid manure are conveyed through the houses in separate pipes and converge at convenient points in each house, where the hose pipe may be attached, so that all the man in charge has to do is to

FIG. 121. GIANT RHEUM (K.W. 7101).
(see p. 268).

adjust his hosepipe and then regulate the three valves so that a flow at the correct temperature and desired strength is obtained. Stove plants, Roses, Carnations, Ferns, pot plants and fruit houses are all watered by this means, which does not necessitate large tanks inside each house or unsightly liquid manure tubs standing in the corners. *T. H. Everett.*

THE PLEASAUNCE.

DURING a recent visit to the seaside town of Cromer, I heard that the beautiful grounds and gardens of Lady Battersea at Overstrand were open to the public in the cause of charity, so I took the opportunity of visiting them, and as it happened to be a beautiful Sunday the visit was one of the utmost pleasure. The gardens are so bewilderingly beautiful that it is difficult to describe them adequately.

Entering by way of the cricket ground, I traversed a stretch of sward, entered the garden proper, and soon came to the Rose garden. Although it was late for Roses I was able to

see that there had been a previous good show of bloom, and many of the bushes were again flowering. Most of the Rose beds are circular in shape, and contain one variety in each. Among the varieties I noted were Christine, Madame Butterfly, General McArthur, Covent Garden, Red Letter Day, Mabel Morse, Etoile de Holland, Elsie Beckwith, Shot Silk, Mrs. Henry Bowles, Mrs. Wemyss Quin, Madame Leon Pain, and Severine. Some of these beds were in the vicinity of a summer-house in the shape of a pagoda with Ivy-clad pillars and a footing of Cotoneaster, while others clustered near a sundial, both of which added charm to the arrangement. The growth of the plants was healthy and remarkably free from mildew which has been so prevalent on Roses this year.

Leaving this garden with the regret that I had not seen it in the height of the flowering-season, I passed along an expansive and well-kept path bordered on either side with trimmed Yews, Irish Yews, Golden Yews, Portugal Laurel and Golden Box, to an enclosure beautified with large Fuchsias in tubs. The last were flowering magnificently; some in ornamental vases were nearly ten feet high. Before reaching this enclosure or shaded retreat, I lingered to examine the fine herbaceous border. Looking at it from the approaching walk it appears to be framed, because on entering it one has to pass through sentinels of pillars of brick and flint covered and canopied with creepers. A wide path traverses the border which skirts it on either side. In the sunshine the beauty of this border seemed to be intensified, and many of the flowers seemed to reflect the brilliance of the light.

The borders are well furnished with well-grown specimens, including *Lobelia cardinalis*, *Lilium tigrinum*, *Helenium*, *Achillea*, *Echinops*, *Gypsophila*, *Phloxes*, *Sidalceas* and *Hemerocallis*. The taller plants almost blotted from view the pillar Roses at the back, whilst the foreground of the border was well furnished with lowly plants, such as *Alyssum saxatile*, *Thymes*, *Sedums*, *Nepeta*, *Arabis* and *Saxifraga*. It is a beautiful border, well-planned, well-planted and well-cared for.

I was attracted along another walk by the sight of a high pigeon-cote and a fountain. Passing along a grass walk bounded on either side by a low hedge of golden Yew, which is in its turn skirted by a pretty arrangement of such shrubs as *Acers*, *Magnolia*, *Golden Holly*, *Buddleia variabilis* and the Hedge-hog Holly (*Ilex ferox*), I came on an uncommon fountain. It is circular and bounded on its margin with Fuchsias and *Echinops*. The interior is faced in mosaic fashion with blue stones, which gives the water a sea-like appearance, and it formed a pleasing, central feature to that part of the garden.

There are many other beautiful walks which I have not the space to describe; all of them lead to some definite object. The walks in that part of the kitchen garden open to the public are either flagged or made of paving in crazy fashion. There are also pergolas covered with Roses or Pears, and a large one furnished with Laburnum which must have been an entrancing feature when clothed with the drooping chains of gold.

The water garden contains a large pond planted with Water Lilies. The mansion is approached from this part through a sunk garden girded so closely by a creeper-clad wall that one might almost mistake it for a hedge. The lower level of the sunk garden is parquettied with bricks forming paths to border the beds and panels of grass. Immediately inside the enclosing wall is a raised border with a brick retaining wall, and furnished with *Heliotrope*, Ivy-leaved *Pelargoniums* and white *Alyssum*. There are vases of white *Marguerites*, but the prevailing colours are blue, pink and white, provided by *Marguerites*, *Heliotrope*, *Ageratum*, *Alyssum*, pink Ivy-leaved *Pelargoniums* and dwarf Dorothy Roses. On the inner wall I noted much fruit on *Pyrus japonica* (*Cydonia japonica*). On this front is a long and handsome loggia. There is a wide view of the sea from the front of the mansion, beyond a broad expanse of lawn which extends to handsome shrubberies that are skirted with many beautiful flowers. *William F. Rowles.*

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C. 2.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Urgent Communications.—If sent by telegraph, these should be addressed "Gard. Chron.," Rand; or by telephone, to Gerrard, 1543.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Letters for Publication as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

Editors and Publisher.—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers.

MR. F. KINGDON WARD'S NINTH EXPEDITION IN ASIA*

XVI.—OVER THE IRRAWADDY-BRAHMAPUTRA DIVIDE.

AT last, on July 11, after five days in the highest camp (Fig. 122), a band of coolies—Nungs, Tibetans and Lisus—arrived from below, and we set out in high spirits for the Lohit. In spite of the rain, the clouds were higher, and we could see the pass distinctly, which anyhow was not more than two or three miles away and 2,400 feet above us; I had frequently, since our arrival in this camp, climbed higher, but had never been to the pass itself. The top of the valley was approached by two abrupt climbs, linked by longer approaches on a more gentle slant; and the turf slope at the head was violet with the great Cabbage-like growths of *Primula chamaethauma* (Fig. 123); the 'Violet Primrose.'

We had started gaily, with two bullocks to carry some of the loads; but as they soon went on strike, their packs were transferred to two yak, picked up half way to the pass. These yak were, after great exertions, got to the top of the range, and then they, too, went on strike, or else it was deemed unwise to take them down the Tibetan side (which was almost sheer for the first 1,000 feet). Anyhow, they were returned to stock, and the men brought the loads on, the last two not reaching camp till dusk. From the pass we could see nothing, except a bigish glacier lake below, and very bare hills, for the valley took a twist just below the lake, and we could not see over the mountains ahead of us.

On the way down the steep slope I found a few plants of *Primula sino-purpurea*, and noticed much the same alpine flora as on the Burma side, except for the almost complete absence of the yellow *Primula blandula* (§ *Candelabra*), and of *Meconopsis violacea*; amongst alpine *Rhododendrons* were *R. repens* and *R. campylogynum*, with the 'Lapponicums,' 'Saluenense,'

and 'Anthopogon'; but it was easy to see that we should not need to descend very far on this side before reaching a different flora—and so it proved.

Below the first lake we reached a second, and descending at a fair pace, we soon came to the

The next day we marched a few miles in drizzling rain, over very boggy ground, crossing many small streams, and finally camping in a thicket of *Rhododendron*, where we had some cover. Some of the pastures were so boggy that only *Irises* grew there, many of last year's capsules

FIG. 122.—DAWN AT HIGH CAMP, 12,000 FT. ALT., SEINGHKU VALLEY.
The Diphuk La, 14,300 ft., is seen on the left.

first patches of forest (*Abies*, with an undergrowth of 'Souliei' *Rhododendron*), and camped in a meadow near the junction of the two streams. The yellow, single-flowered *Nomocharis* was fairly common here, also a green-spotted *Fritillaria*, *Anemone rupicola* (not seen on the Burma side), and the violet *Iris*. More inter-

still containing good seeds. Patches of 'Lapponicum' *Rhododendron* covered much of the ground, especially on the flanks; and where stone heaps occurred there were thickets of *Rosa sericea*, *Potentilla fruticosa*, *Salix*, *Spiraea*, *Pyrus*, several species of *Lonicera*, etc. A few straggling *Abies* occupied dead ground,

FIG. 123.—GROUPS OF PRIMULA CHAMAETHAUMA.
On alpine-turf slope, 14,000 ft. alt., Seinghku Valley.

esting was a giant *Rheum* (Fig. 121), with pointed, palmate leaves, from amidst which rose a pillar clothed in red beads; this plant had not the white bracts of the Tibetan *R. nobile* or the Chinese *R. Alexandrae*, but was more like *R. palmatum*. It grew eight feet high in the wet mud by the side of the stream.

with 'Lacteam' *Rhododendron*, *Acer*, *Berberis*, *Clematis montana*, and so forth. The absence of any path made the going difficult; when we were not wading through the bogs, we were clambering over boulders, and it was hard to say which was the more unpleasant. There were myriads of mosquitos and sand flies, so that

* The previous articles on Mr. Kingdon Ward's Ninth Expedition in Asia were published in our issues of August 14, 28, October 9 and November 20, 1925, and January 1, February 19, March 5, 19, April 9, 30, June 4, 18, July 30, August 20, and September 10, 1927.

taking one thing with another, it was hardly surprising that the valley was deserted by man and beast.

On the third day, July 13, after a minimum temperature of 47° , we descended a long way and entered the Conifer forest, where I noticed some big, red-barked Birch trees, Poplars and Maples. There was an undergrowth of small trees and shrubs, including a low-growing Ilex, a *Lonicera* very like *L. Webbiana*, one or two other species of *Lonicera*, *Deutzia*, *Euonymus*, a pink-flowered Rose, and numerous *Rhododendrons*, by far the most abundant being a small '*Heliolepis*.' This latter grew either in the forest or formed dense thickets in the open, and being at this season in full bloom, was a very fine sight (Fig. 124). The flowers vary considerably, from pink to white, with a purple flash at the base; and though individually small, the trusses are large and borne very freely. The leaves are aromatic. The plant seems to grow anywhere and to be as hard as nails, so that I regarded it as quite one of the best all-round species met with. It grew only in this valley at this one spot, between 10,000 feet and 11,000 feet altitude, and we lost it next day, nor did I ever see it anywhere else; it was abundant, but strictly local. Height four feet to six feet, forming a neat bush. It is interesting to note that this species was still in full bloom when we returned this way on July 25, and doubtless it continued in flower until the end of the month. I collected a lot of last year's capsules and extracted a pinch of seeds in case of accidents; but as it turned out, we passed this way again in November, when I collected ample seeds.

In the forest I noticed *Pyrola*, several ground Orchids, *Roscoea*, species of *Thalictrum*, *Souliea vaginata*, *Primula chungensis*, etc. Other *Rhododendrons* were *R. rivulare*, *R. trichocladium*, and the usual '*Lapponicum*' in the open. It was quite remarkable how different the flora was on this side of the valley, and how alike it was to the flora of the Tsangpo valley, as revealed in 1924.

On the other bank of the river there was a hot spring, visited at night by great numbers of Takin, who take the waters; and a little higher up the valley one could still cross the river on a snow bed, which, indeed, was still intact a fortnight later. The mountains on either side of us were pretty high, and even steeper than the walls of the Seinghku valley; moreover, this valley, far from widening out as we descended, only grew narrower, and was nothing more than a slit in the rocks, some 3,000 feet deep here. This accounted for the immense accumulations of snow at the bottom, the same having been emptied out of the valleys higher up. The north face—the valley lay north-west to south-east—was fairly well covered with Conifer forest, but the south face could only support dense thickets of *Rhododendron*; but both faces showed a considerable proportion of bare cliff and stripped scree.

On July 14, after a slightly warmer night, we had a fine day, though we were not blessed with sunshine. We covered five or six miles in as many hours, for though there was a track from this point on, the going was rough, and we were continually held up by torrents difficult to cross. We were in forest all day and noticed a big change in the vegetation, particularly amongst the *Rhododendrons*, of which I found seven species not seen on the Burma side. These were a '*Triflorum*,' a '*Virgatum*,' a '*Maddenii*,' a '*Taliense*,' an '*Arboreum*,' a '*Grande*' and *R. ixenticum*. None of them was in flower, but the '*Virgatum*' was probably *R. oleifolium*, and the '*Triflorum*' looked very like the '*Mahogany Triflorum*' of Tibet. The '*Grande*' was abundant, forming a conspicuous part of the forest which was largely composed of huge *Picea* and *Tsuga* trees, with scattered *Larix* and *Abies*. The other *Rhododendrons* were more commonly found on the enclosing cliffs, or on high, tree-clad boulders in the river bed, or amongst a loose undergrowth which also included species of *Lonicera*, *Philadelphus* (in flower), *Euonymus*, yellow Jasmine, *Pyrus*, *Ribes*, *Viburnum*, *Hydrangea*, *Deutzia*, *Enkianthus*, *Rosa*, *Cotoneaster* and considerable thickets of Bamboo. But for the most part the forest was fairly open and penetrable,

and we waded waist deep through an undergrowth of nothing more formidable than large herbs, including Ferns, *Rodgersia*, *Polygonum*, *Impatiens*, *Cynoglossum*, *Podophyllum* and *Primula chungensis*, with very big leaves and elongated spikes of whorled, orange flowers, by this time nearly, though not quite, over.

Where the forest was not penetrable, or where the cliffs closely invested the river, we climbed over boulders in the open, and here I found two *Primulas* in fruit, *P. capitata* just coming into flower, *Lilium taliense* (thus affording another link with the drier end of the Tsangpo gorge), and a small-leaved, bushy *Lonicera*, rather like *L. nitida* in general complexion, except that it was hung all over with little

boulder-chutes were bushy *Hypericums*, *Buddleia*, *Vaccinium* (a pretty species crowned with creamy-white flowers), *Lonicera*, and a number of climbing plants, such as *Clematis*, *Vitis* and *Aristolochia*. The valley was now narrower than ever, shut in by towering cliffs scored by deep slots, and the river, swollen to formidable proportions, came bounding down a steep, broken stairway. It was entirely overhung on both sides by large *Rhododendron* trees and bushes, mainly of the '*Grande*' type, and in early spring when these are in flower, the scene must indeed be splendid. Yet there is but a fringe of forest here really, for immediately above the river the cliffs are scantily clothed.

We camped on a sand-spit by the roaring

FIG. 124.—RHODODENDRON SP., K.W. 7108, § HELIOLEPIS.

cream-coloured, tubular flowers which, in winter, were followed by large, plum-blue fruits. Finally, to clinch the contrast between the Di Chu valley and the Seinghku, the forest trees here were all clad with waving streamers of Lichen, sure sign of a drier climate; and an even more significant fact, which to my warped mind accounted for the entire difference of floras, was that we had just had a whole day without rain, the first for several months.

We camped in the forest and on the 15th, after a minimum temperature of 51.5° (which seemed to us almost uncomfortably warm), proceeded down the valley, more than ever trapped between the cliffs and surrounded by forest. More changes intruded themselves as we descended another thousand feet. A fine '*Maddenii*' *Rhododendron* was in bloom, sprawling over bulky boulders—flowers white, fragrant; perhaps *R. Maddenii* itself. *R. megacalyx* was also seen—flowers over, and one of the Edgworthii series, something like *R. bullatum*. *R. sino-grande* bulked large in the forest, together with *Pinus* sp., several Oaks and big-leaved *Araliaceae*. On the open

cataract, and so warm was it (minimum 53.5° , altitude about 7,000 feet) that I slept uneasily. The men doubted if we should reach Kahao next day, and it certainly looked as though the valley might continue for many miles yet, slowly descending; but I intended to make an effort.

Meanwhile there was plenty to do, since the flora was so different from that of the Seinghku. I have referred to six new species of *Rhododendron*, and on the way back I found two more. Of the *Primulas*, *P. chungensis* was new to the collection, and of two species found in fruit only, one might have been a '*Denticulata*' (*P. atropurpurea* perhaps), the other an '*Auriculata*' and neither of them had been found on the other side. At least three species of *Lonicera* were fresh acquisitions, so was *Lilium taliense*; and though *Pinus longifolia* occurred on the Burma side, *P. excelsa* was the common species here. In short, after a march through the jungle of 450 miles from Myitkyna, we had at last reached the dry zone of the Tibetan marches. F. Kingdon Ward.

NURSERY NOTES.

MESSRS. J. CHEAL AND SONS.

LIKE many another successful business, the nursery of Messrs. J. Cheal and Sons, Crawley, had a humble beginning. Mr. John Cheal was a local farmer, and his sons Alexander and Joseph, the heads of the firm, decided to start a nursery business in 1871 on some of their father's farm land fronting the main road from London to Brighton. The site of the nursery originally was open, common land used for grazing cattle and geese. Mr. Cheal senior broke it up, drained and farmed it so that when his sons took it over it was exceptionally good land for their purpose. The young firm specialised in fruit trees, for which they soon gained a reputation, and in a very few years they were asked to advise and assist in the laying-out of orchards and fruit plantations in various parts of the country. Thus many of our older readers will associate the name of Messrs. J. Cheal and Sons chiefly with fruit and fruit-growing, but the firm has a big business nowadays in all branches of the nursery trade, and their establishment is one of the most complete in the whole country. They grow huge stocks of fruits, Roses, shrubs and trees, including Conifers of all kinds, hardy herbaceous flowers, alpines, Dahlias, and indoor plants, besides being seedsmen, bulb merchants, horticultural builders, makers of garden furniture and stone merchants, for they own their own quarry which furnishes the large amount of stone required by their landscape department.

For over thirty years Messrs. Cheal and Sons have figured prominently in the Dahlia world, both as raisers and growers of this beautiful autumn flower, and we doubt if any other firm grows so many of these plants. Visitors are always welcome to the nursery, and anyone who has the opportunity just now would be advised to inspect the several acres of Dahlias which, when we saw them a day or two ago, were at the height of their beauty. Mr. Joseph Cheal is one of the pioneers who worked hard in the past to popularise the Dahlia as a garden plant, and we congratulate him and his fellow workers in attaining their object, for the Dahlia is now grown more extensively than it ever was. Of all florists' flowers there is none which includes a greater variety of types or a wider range of colouring, and there is no reason why even more distinct sections of the Dahlia should not be evolved. The beautiful scarlet Coltness Gem, which has "caught on" in favour for bedding in the past year or two, represents a type which Mr. Cheal raised a very long while ago; we remember many years ago seeing Tom Thumb Dahlias a foot or so high, grouped in panel beds in a little formal garden at Crawley. The late Mr. Girdleston also raised these Tom Thumb Dahlias about the same time as Mr. Cheal, but they were neglected until the advent of Coltness Gem, and now raisers are turning their attention to this type in their endeavour to get others as good as the popular scarlet variety. The illustration in Fig. 125 shows two long borders of these Mignon Dahlias, as they are now called, on either side of a broad grass pathway, with a row of Crimson Flag and another of White Star forming the boundary. There are some thirty or forty varieties in these borders, but several are very nearly alike; the choicest half-dozen are: Emerald, a new pink variety not yet in commerce; Peter Pan, of the same colour as Coltness Gem, but claimed to be hardier and free of the disease which is attacking the older variety in many districts; Canary Bird, a rich yellow variety but rather taller than some; Grace, orange-red; Rose Bud, of the Major van Sweiten type, but dwarfier, a very pretty bloom having a rosy suffusion on a gold base and with a salmon tint; and Roy, dark crimson. Duncelt Yellow is rather too tall, but is a rich yellow, and if others are required we would recommend: Lustre, a dark-stemmed variety with brilliant crimson flowers and Lady Aileen, self-pink, with a darker centre.

On either side of the borders illustrated are big stocks of Dahlias planted in their various sections, Single, Paeony-flowered, Miniature

Paeony-flowered, Colletterette, Star, Cactus, Decorative and the other types into which the flower is divided. To make a selection in the respective divisions is no easy task, but we may describe some of those which appealed to us most. For instance, of the Singles, we were most impressed with Leon, a true scarlet variety of perfect form, a plant of good stiff habit which throws its flowers well above the foliage; Columbine, an old sort, but still one of the best of its colour—a rosy suffusion; Ariel, a coppery-orange variety; Pink Beauty, bright rose-pink; and Lemur, which should be included as much for its beautiful dark foliage and stems as for its rich velvety-crimson blooms with black centres.

The Paeony and Miniature Paeony Dahlias are excellent for garden decoration and valuable for supplying cut blooms. Of the large Paeony-flowered type one of the most conspicuous in the collection was Glory of Nyjkerk, a flower of deep, royal purple, set off by a beautiful golden centre. Others of merit in this section are Dream, a beautiful salmon-coloured flower on long, wiry stems; Tangerine, a very suitable variety for bedding; Emile, rich yellow; Aphrodite, one of the best whites in this section; and Mrs. E. Blount, which produces an abundance of rosy-scarlet flowers on long, stiff stems. The small Paeony, or Charm Dahlias, as they are sometimes termed, are represented at Crawley by numerous fine varieties, those of outstanding merit being Pink Perfection, a new sort not yet in commerce, but very free, with a good, compact habit; Saturn, a dwarf, strong-habited variety, producing plenty of its rose-coloured flowers that have a faint suffusion of crimson; Mermaid, a very beautiful clear yellow variety; Mrs. George Monro, with florets of a delightful pink tone in the upper part and the lower half golden; and Radium, a fine, crimson-scarlet variety growing about three feet tall.

The Cactus varieties, taken in the mass, were disappointing, for they either hung their heads so that the flowers could not be seen or the blooms were enveloped in a mass of foliage. Some, however, are fine for garden decoration, such as Joyce Goddard, a very free-flowering sort that sends up its orange flowers with a golden base well above the foliage; Guardian, a very vigorous scarlet variety; Mrs. C. Forster, pink; Mary Purrier, rich crimson; Edgar Jackson, coral-pink, a variety of good habit; White Ensign; Cygnet, yellow, marked with red lines; and A. E. Amos, crimson. Cygnet has sported and produced a self coral form.

Crawley is the home of the Star Dahlia, and of the very numerous varieties of the Star type we would still give the palm to the original White Star. Since this was raised many other beautiful varieties have been obtained by Messrs. Cheal and Sons, the best, in our opinion, being Rye Star, with an orange centre and florets tipped with rosy-pink; Burford Star, a reddish-orange variety which is almost scarlet in the young bloom; Purley Star, carmine with an orange-buff centre; Rowley Star, glowing crimson; Hyde Star, rosy-cerise, flushed with crimson at the base; Gatton Star, salmon, suffused with coppery-rose; Rusper Star, rich crimson, tipped with scarlet; and Horsham Star, a coppery-rose variety with a beautiful maroon centre.

The Decorative Dahlia is divided into the small Decorative and large Decorative, and of these the Lowfield Nurseries contain a fine collection. Of the large Decoratives, which are so valuable for making an imposing display in vases, and especially for church decorations, the variety Mrs. Wheeler Bennett is one of the best of the yellow-flowered sorts, and in the collection the blooms showed conspicuously on tall stalks well above the foliage. President Wilson, vermilion-scarlet; Mrs. David Hepburn, crimson; Mrs. A. R. Mountain, pink, flushed with silver; Anthony, lilac, suffused with purple after the Ben Lomond type; and Cheal's Yellow, a dwarf variety growing only three-and-a-half feet tall, are other good sorts in this section.

Not much advance has been made in recent years with the Colletterette Dahlias, and the best in Messrs. Cheal's collection were Dulcie, orange, edged with gold and a canary-yellow collar, Lowfield Beauty, bright crimson with a yellow collar; Madame Poirier, purplish-mauve, with

a white collar; and Mabel Mary, claret-coloured with a lighter collar tipped with white.

We have notes of other sections of Dahlias, such as the large Singles, Pompons and Show types, but a description of these would require more space than is at our disposal, and we may close our notice of this interesting nursery with a few remarks on the fruit trees. Quite close to the office is a magnificent tree of the old Sussex Nannie Apple, and near by are several trees of Forge, not very far from where the old forge, from which this Apple takes its name, existed, but this is now demolished. Other interesting old Sussex Apples are Emily Charles, something like Quarrenden; Mark Marshal; Betty Geeson and Crawley Beauty; the last was found in a cottage garden in Crawley and it is a valuable variety, for it flowers so late in the season that in most years it escapes damage by frost. The trees bear abundantly and the fruits keep until February.

Messrs. Cheal and Sons raise some fifty to one hundred thousand fruit trees every year, and they are worked on different stocks, according to the purpose for which the trees are required. We had an interesting chat with the fruit foreman, who informed us that, in his opinion, the present trouble with Strawberries would be largely obviated if sulphur was lightly dusted over the plants in the spring. Once when they start growing, again when the plants are throwing up their flower trusses, and finally, when the fruits begin to set. With regard to black spot in Strawberries he recommended spraying with polysulphide as a sure specific. In his opinion, The Duke is one of the best of the newer sorts, but he informed us that they had a new variety named Dumbarton Rock, which produces large, round berries of the shape of Noble, which is of great promise, for the plant is hardy and very fruitful.

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, Ante pp. 131-137).

(Continued from p. 252).

MIDLAND COUNTIES.

NORTHAMPTONSHIRE.—The fruit crops are very poor, the only exception being Black and Red Currants, which bore full crops. Apple and Pear trees flowered freely, but several severe frosts at the end of April and early May destroyed the prospect of good crops of these fruits. All the early Strawberries were destroyed by frost, and later varieties were spoilt by the continuous wet, dull weather, during the latter part of June and early July. *F. W. Gallop, Lilford Gardens, near Peterborough.*

—Nine degrees of frost on April 30 did a deal of damage to the fruit blossom and practically ruined the whole of the Pear crop which at one time promised well. A few of the early-flowering Apples suffered, and the crop of Bramley's Seedling was spoiled, after promising well. The early flowers of Strawberries were frozen, but the plants made a good recovery and we had some splendid fruits, but the Strawberry season was quite three weeks late. The only small fruit to suffer was the Gooseberry, on the upper parts of the bushes. The fruits that escaped injury were large and of fine quality. Black Currants and Raspberries fruited splendidly, but Nuts were entirely spoilt by the frosts. *A. R. Searle, Castle-Ashby Gardens, Northampton.*

NOTTINGHAMSHIRE.—The outdoor fruit crops are comparatively a failure and the lightest on record for the past thirty years. We experienced unusually severe frosts during April and May; on April 2 we had 8°, on the 17th, 3°, on the 26th, 4°, on the 29th, 4°, and on the morning of April 30, 14°. Pears were well set, and their ruined appearance in the early morning of May 1 was a pathetic sight; in a few days they dropped almost to the last fruit. Plums fared a similar fate. Apples are a failure with the exception of a few varieties, such as Lord Gros-

venor, Lane's Prince Albert, Worcester Pearmain, Rival, Court Pêdu Plat and Cox's Orange Pippin, but the last is half a crop only. Gooseberries were, perhaps, rather over the average and of good quality. *S. Barker, Clumber Gardens, Worksop.*

OXFORDSHIRE.—The fruit crops are much better than was expected after the severe frosts experienced during the blooming period. The yield of Apples is under the average, but on the whole we have a fair crop and the fruits are swelling well. Pears, with a few exceptions, promise a good crop of clean fruits. Plums were a fair yield on walls, where they were protected, but in the open a failure, owing to frost while the trees were in bloom. Peaches are satisfactory; of Cherries and Apricots we had about half a crop. Small bush fruits, with the exception of Gooseberries, yielded heavily. Strawberries were a good average crop, although a lot of the berries were spoilt through wet weather. Royal Sovereign, Leader, Sir Joseph Paxton and Givon's Late Prolific I find do best in these gardens. *Ben Campbell, Cornbury Park Gardens, Charlbury.*

—The fruit crops are, on a whole, very good. Apples are plentiful on most trees; Plums were very poor although we had a good amount of Plum blossom. Small fruits were very satisfactory, but excessive wet caused many Strawberries to rot. Peaches and Nectarines are as fine as I have seen of late years. The soil is of a very heavy texture on a sub-soil of clay. *B. Elkington, Berry Cottage, near Banbury.*

—The fruit crops promised to be amongst the best for many years, but the long, cold spring and severe frosts in April lightened the crops considerably. After the 12° of frost on April 29, it looked as if the whole fruit crops were ruined, but the weather being exceptionally dry, a good deal of the later blooms escaped injury, and especially in the case of Apples. Strawberries suffered severely, but the quality of the berries was good; other small fruits escaped practically untouched, and all were of first-class quality. Insect pests have been very troublesome, also a good deal of Apple mildew appeared after the cold winds. The soil is a heavy loam over stiff clay. *Victor Gammon, Eynsham Hall Gardens, Witney.*

(To be continued).

HOME CORRESPONDENCE.

[The Editors do not hold themselves responsible for the opinions expressed by correspondents].

Iris dichotoma.—Three plants of *Iris dichotoma* which I owe to the kindness of my friend, Mr. T. Hay, grown in a cold greenhouse, have given me much pleasure. The first blossom appeared on July 25, the last on September 16. The three plants produced six blossom stems. The blossoms appeared after 3 p.m. from four to seven at a time and lasted something over three hours. They have a pleasant though not a strong scent. The height of the tallest stem was thirty-one inches. One of the three plants had flowers a little darker than the other two; they varied from a pale pinkish mauve to a pale violet. They have produced about a dozen good pods of seed. *G. Yeld, Orleton, Gerrard's Cross.*

The Lily Season in Southern Scotland.—Though we have frequently had floods of rain, followed by almost tropical sunshine, in the south-western regions of Scotland, atmospheric influences have been by no means adverse to the successful cultivation of Lilies. The finest example of *Lilium giganteum* I have seen for years was at Mr. Kenneth McDouall's garden at Logan House, about a month ago. Grown on the green fringes of a sheltering wood, which intervenes picturesquely between the famous gardens and the stately mansion-house, "amid its green, ancestral trees," it was a veritable giant in stature, approximating to a height of thirteen feet; and bearing twenty-three enormous flowers. Only at Lochinch or Castle

Kennedy, close to the remains of the ancient castle, have I seen this Imperial Lily rising so majestically. Other Lilies that have been almost equally impressive at Logan for the last two years are *L. Willmottiae*, *L. Grayi*, *L. philippinense formosanum*, *L. regale* (one of the loveliest flowers in cultivation), *L. Burbankii*, *L. Brownii* and *L. auratum platyphyllum*, which, according to my experience, requires a sheltered situation, otherwise its petals suffer greatly from high winds. Most of these Lilies are cultivated at beautiful, wood-environed Monreith, by Sir Herbert Maxwell, with striking success; and particularly the beautiful *L. regale*, which is illustrated and attractively described in his *Flowers, a Garden Notebook*. The predominating Lily at Castle Kennedy, as I have already suggested, is *Lilium giganteum*, but still more fascinating are the varieties of *Nymphaea Marliaceae*, in the miniature lake; almost midway between the Old Castle and the New. I should have mentioned somewhat earlier in this short contribution that at Logan,

thus one cleared away some fables such as the "pencil thickness," for out of some hundreds of shoots the old gentleman cut off not a single one had attained to such a size! *H. E. Durham, Dunelm, Hereford.*

A Summerless Summer.—In your issue of September 10, a note appears on the unseasonable summer. My memory takes me back to a season when there was no summer, and when I remember a woman, who had waited hopefully, saying in mid-October, "I really do not think we shall get any summer at all." This was in 1860, which I have cause to remember, for I was entrusted with the task of rearing the bedding plants for furnishing the R.H.S. gardens at South Kensington, which were opened the following year. Purple King Verbena was largely in request, and it was very difficult to procure healthy cuttings, for the stunted stock was almost devoured by thrips, and there was no XL All insecticide then. At last, by the aid of an ordinary hot-bed, we succeeded in getting

FIG. 125.—BORDERS OF MIGNON DAHLIAS AT LOWFIELD NURSERIES, CRAWLEY.
(see p. 270).

the lovely blue Lily of Zanzibar, which is new to this southern region of Scotland, has proved a great and gratifying success. On my own borders the Lilies that have been most successful are *L. candidum*, finely effective and without disease; *L. longiflorum giganteum*, which is grandly ornamental; and the refined *L. speciosum magnificum*. As my flower borders are now adequately protected by a garage (which I have covered with the finest climbing Roses) from northerly winds, I hope to cultivate the great Lilies of the Himalayas, of western China and California, with almost equal success. *David R. Williamson.*

Lorette Pruning.—Should your correspondents, Messrs. Impey and Cheer, happen to be in this neighbourhood, I shall be happy to show them trees which have been treated on the above plan since 1913, with some interference during the war period. Also Plum and Morello Cherry trees which have been treated on the allied scheme, which I detailed some while ago in these pages. Luckily, I visited M. Lorette in 1914 to get certain obscurities cleared up, just before war broke out (resulting in the lecture I gave to the R.H.S. a year or two later);

a healthy stock and then all was easy. There was a collection of Verbenas on trial, but they were a complete failure. On Christmas eve there were 34° of frost, i.e., 2° below zero, and as the thermometer was under the charge of Mr. Robert Thompson and overlooked by Dr. Lindley, the reading was probably correct. In corroboration of this, trees of *Cedrus Deodora*, in Glendenning's nursery, twenty feet to thirty feet high, were killed outright. On that eventful night the boiler heating the house in which the Geraniums were stored broke down. Fortunately, our old friend Mr. Barron, knew how to act. The house was covered with thick canvas early in the morning. The sun afterwards came out brightly, and when the temperature in the house rose to freezing point, the plants were syringed with cold water, and the ice thawed gradually, when the plants were removed to another house and not one of them was lost. In proof of my success under difficulties, I may be allowed to state that the Council of the R.H.S., on the recommendation of Mr. Eyles, the Superintendent, awarded me a donation of five pounds, which, I need not say, I was very proud to receive. *Wm. Taylor, Bath.*

ROYAL HORTICULTURAL SOCIETY.

EXHIBITION AT HOLLAND PARK HALL.

September, 28, 29, and 30.

Floral Committee.

Present: Section A—Mr. F. J. McLeod (in the Chair), Mr. J. T. West, Mr. E. R. Janes, Mr. D. B. Crane, Mr. H. J. Jones, Mr. A. E. Vasey, Mr. J. M. Bridgeford, Mr. Chas. E. Pearson, Mr. Geo. Churcher, Lady Beatrix Stanley, Mrs. Ethel M. Wightman, Mrs. Helen Lindsay Smith, Mr. R. Findlay, Mr. Donald Allan, Mr. Hugh Dickson, Mr. Wm. Howe, Mr. Arthur Turner, Mr. G. W. Leak, Mr. W. B. Gingell, Mr. Jas. B. Riding, Mr. Courtney Page and Mr. M. C. Allwood.

Section B—Mr. Gerald Loder (in the Chair), Mr. W. J. Bean, Mr. R. C. Notcutt, Mr. A. Bedford, Mr. E. H. Wilding, Mr. T. Hay, Mr. James Hudson, Mr. W. G. Baker, Mr. Amos Perry, Mr. L. R. Russell, Mr. F. G. Preston, Mr. W. B. Cranfield, Mr. Hiatt C. Baker, Mr. J. Yeld and Mr. E. Marsden Jones.

AWARDS OF MERIT

Fremontia mexicana.—This has pale yellow flowers and fine-lobed leaves that are grey on the under sides. The stems are also downy. We believe this species flowers in a much younger state than the well known *F. californica*. Shown by Mr. J. HAY, Hyde Park, and Mr. R. C. NOTCUTT.

Bertolonia sericea cristata.—A very handsome stove foliage plant with broad, deep green leaves that are veined, cross-veined and spotted with silver in a very beautiful fashion. The margins of the leaves are crisped and waved. Shown by Messrs. L. R. RUSSELL, LTD.

Gaultheria Forrestii.—A lowly shrub with ovate lanceolate, stiff, green leaves, that have serrated margins. The small, bluish fruits are borne in little clusters from the axils of the leaves and show to best advantage when viewed from below. Shown by Messrs. ROBT. VEITCH & SON.

Gentiana Pneumonanthe.—Our native Gentiana and one of the bluest of blue flowers. The flowers are almost sessile, opposite and borne in the axils of the upper leaves. As shown it was about 1 ft. high, but the height varies greatly from four inches upwards. Shown by Colonel STEPHENSON CLARK, Border Hill, Cuckfield.

Canna Sweetheart.—A bold large flowered variety, bearing so many as ten expanded blooms on one spike. Colour, rich rose-tinted salmon, almost scarlet in the newly opened buds. Shown by the Hon. VICARY GIBBS (gr. Mr. E. Beckett), Aldenham House, Elstree.

Aphelandra squarrosa var. *Leopoldii*.—In this stove plant the broad green leaves are heavily veined with creamy-white. The spike is conspicuous by reason of the imbricating, pale yellow bracts. Shown by Messrs. L. R. RUSSELL, LTD.

Chrysanthemum Gloria.—A deep golden-yellow decorative variety, with reflexing, pointed florets. Shown by Messrs. CRAGG, HARRISON AND CRAGG.

Chrysanthemum Daffodil.—A bright yellow, early-flowering variety, with dark stems and foliage. Shown by Mr. H. SHOESMITH, Junr.

Chrysanthemum Glow.—A rich chestnut-coloured decorative variety with golden tips to the florets. Shown by Mr. H. SHOESMITH, Junr.

Chrysanthemum Jack Robbins.—A showy early-flowering variety with reflexing florets. The colour is deep apricot with a bronze suffusion. Shown by Mr. H. WOOLMAN.

FOR TRIAL AT WISLEY.

Aster Empress of Colwall.—This is a double-flowered variety bearing plenty of rounded rosy-mauve flowers. Shown by Mr. ERNEST BALLARD.

Aster Amellus Sonia.—The bright rose-coloured flowers are of rather more than average size and are well disposed. Shown by Mr. T. BONES.

Kniphofia Cardinal.—A dwarf variety bearing spikes of dark cardinal coloured flowers. The spikes bend over gracefully at the tips.

Kniphofia Yellow King.—The heads of flower of this variety are larger than those of the foregoing and are a pleasant yellow shading.

Kniphofia Fireflame.—This is a large spike of uncommon colouring. The yellow ground colour is heavily flushed with fiery orange. All three varieties were shown by Messrs. G. LUBBE AND SON.

NEW DAHLIAS.

The Joint Committee selected the following new seedling Dahlias for trial at Wisley:—

Dorothy Brousson.—A free-flowering Cactus variety of considerable garden value. The medium-sized flowers, which are borne on long stems, are yellow. Shown by Mr. H. S. BROUSSON.

Jean.—A good white Miniature Paeony-flowered variety.

Ethelwulf.—Is a well formed white Star Dahlia. This and the above were shown by Mr. CHARLES TURNER.

Polly.—A yellow, Miniature Paeony-flowered variety. Shown by Mr. J. MATTOCK.

Rye Star.—A very pretty flower which has a stippled golden centre and is broadly tipped with pink.

Little Marvel.—A well-formed, rosy mauve Pompon variety. Both were shown by Messrs. J. CHEAL AND SONS.

The Bishop of Llandaff.—An attractive Miniature Paeony-flowered variety of glowing, deep crimson colour. The divided foliage is dark purple.

Mrs. Kenneth Webb.—A glowing orange Miniature Paeony-flowered variety. This and the above were shown by Messrs. WM. TRESEDER LTD.

Zulu.—A large Single of rich orange colour. The large, divided leaves are stained with purple.

Mrs. A. S. Galt.—A rich red miniature Paeony-flowered variety.

Mrs. H. R. Beeton.—A bright crimson Miniature Paeony-flowered variety. These three Dahlias were shown by Mr. A. J. COBB.

Columbia.—A medium-sized Decorative variety of deep rosy-mauve colour.

Miss J. Kenkel.—A large light ruby-coloured Decorative variety. These two varieties were shown by Mr. F. P. MAJOOR.

ROSES.

Roses were an unusually fine feature of the show and the numerous exhibits arranged all along one side of the hall provided a fine demonstration of the value of these flowers for the autumn.

Messrs. ALEX. DICKSON AND SONS staged large baskets and stands of blooms that had withstood the weather and the journey from the North of Ireland. A few of their best sorts were Dame Edith Helen, Lady Helen Maglona, Ophelia, in fine form, the yellow Christine, the exquisite Shot Silk, Lady Mary Elizabeth, of rich rose-red colouring; the golden Mrs. Wemyss Quin, Madame Butterfly and the deep crimson Col. Oswald Fitzgerald.

Mr. ELISHA J. HICKS exhibited rather stiffly arranged, upright stands of Joanna Bridge, F. K. Druschki, Golden Ophelia, the deep red Covent Garden, Independence Day, Lady Inchiquin, Emma Wright, the white Mrs. H. Stevens, Clovelly, and many other good sorts.

About eighty low bowls and bunches of Roses made up the bulk of the exhibit from Mr. J. MATTOCKS, while a few tall stands of Moonlight, Irish Elegance and Coral Cluster were used as a background. The flowers in the bowls were very clean and bright, the chief varieties represented being Golden Emblem, Golden Ophelia, Mrs. H. Winnett, Red Letter Day, Etoile d'Holland, Los Angeles, Chas. E. Shea, Marcia Stanhope and Emma Wright.

Messrs. S. MCGREDY AND SON exhibited a very pretty group of Roses, their centrepiece

THE Autumn Show of the Royal Horticultural Society, in Holland Park Hall, London, on the above dates, was favoured with beautiful weather and bright sunshine. The hall did not present such a sombre appearance as usual, for the top light on a dull day is very poor. Viewed from the gallery, the building presented a galaxy of beautiful colours, to which Dahlias, Roses, Michaelmas Daisies, Carnations, Orchids, Begonias, Chrysanthemums and other flowers contributed. Hardy border flowers largely predominated, but there was sufficient of other subjects to provide plenty of variety, and on the whole, the show was a great success. Fruits and vegetables were relegated to the gallery, and only narrow tabling was provided for them, so that it was impossible to show them to advantage.

This is to be regretted, as autumn is the time when hardy fruits are at their best, and they are as interesting as, say, Michaelmas Daisies, which were shown on every hand downstairs.

The outstanding exhibit was Messrs. BLACKMORE AND LANGDON'S Begonias.

Orchid Committee.

Present: Sir Jeremiah Colman (in the Chair), Mr. Gurney Wilson (Hon. Secretary), Mr. J. E. Shill, Mr. J. Wilson Potter, Mr. J. C. Cowan, Mr. Richard G. Thwaites, Mr. A. A. McBean, Mr. T. Armstrong, Mr. R. Paterson, Mr. S. W. Flory, Mr. E. R. Ashton, Mr. Stuart H. Low, Mr. Fred K. Sander, Mr. Frederick J. Hanbury, Mr. H. G. Alexander and Mr. Chas. H. Curtis.

AWARDS OF MERIT.

Odontoglossum Toreador (*Laurentia* × *crispum-Solon*).—This has large round flowers with pure white ground, and one or two red brown spots on most of the segments. The petals and sepals have "shadowy," shaded markings of rose on each side of the central white area. The lip has a pair of rich red-brown markings below the golden disc. Shown by Messrs. CHARLESWORTH AND CO.

Laelio-Cattleya Momus, *Low's* var. (*C. Octave Doin* × *L.-C. Rubens*).—A handsome, rounded flower of excellent size, form and substance. The colour is soft purplish mauve, slightly paler at the margin. Lip broad, rich velvety purple, with the throat veined with old gold. Shown by Messrs. STUART LOW AND CO.

OTHER NOVELTIES.

Messrs. ARMSTRONG AND BROWN showed *Cattleya amabilis* Our Queen and *Odontioda Juno* carrying a branched spike of nearly sixty purplish-rose and white flowers. Baron BRUNO SCHRODER sent a flower of a grand form of the yellow Brasso-Laelio-Cattleya Margery.

Messrs. CHARLESWORTH AND CO. showed Brasso-Laelio-Cattleya Asmodia and one or two other interesting plants and Messrs. J. AND A. McBEAN exhibited *Cattleya Eneas* var. *splendens*, with old gold sepals and petals; and *Laelio-Cattleya Profusion* var. *Pacific*.

GROUPS.

Messrs. STUART LOW AND CO., who were the only exhibitors of a group of Orchids, had a display wherein *Vanda coerulea* figured in the background, with fine plants of *Cattleya Hardyana*, while just below these were capital examples of *Odontoglossum grande*. Conspicuous on one side was a specimen of *Cattleya Gaskelliana* with thirteen flowers. The yellow *C. Junia* was also very much in evidence, while *C. amabilis* and *C. Momus* were also good and effective. Other interesting things in this group were *Sophro-Cattleya Doris*, Cobb's variety, with one brilliant bloom; *Burlingtonia fragrans*, with two spikes of its white, delicately-scented flowers; *Sophrontitis grandiflora*; *Cypripedium Fair-Maud* (*Fairrieanum* × *Maudiae*), *C. Godefroyae* and several useful *Odontiodas* and *Odontoglossums*.

being a large basket filled with the rich pink Mrs. A. R. Barraclough. Around this were other baskets and stands of Los Angeles, Arthur Cook, Admiration, Margaret McGredy, Golden Emblem, Edel and Betty Uprichard—a very fine exhibit.

The bright display made by Mr. J. H. PEMBERTON included many varieties of his own raising, such as Pax, Penelope, Prosperity, Vanity and Moonlight. With these were associated bowls and stands of Mermaid, Helen Taylor, W. F. Dreer, I. Zingari, Los Angeles, Bernice, Naomi, Betty Uprichard and The Adjutant.

Mr. GEORGE PRINCE had a beautiful exhibit of baskets of Roses with a few stands as background. Mabel Morse, Mrs. C. Page, Covent Garden, Golden Emblem, Madame Butterfly, Lady Inchiquin, K. of K., Roselandia and Lady Pirrie were all charmingly shown in big baskets.

In the contribution from Messrs. D. PRIOR AND SONS we noticed good stands of Golden Emblem, Ophelia, Hugh Dickson, Gooland Beauty, of fine colour, General McArthur, Elsie Poulsen, Lady Inchiquin, Los Angeles and Frank Reader, the last represented by fine flowers of pleasing pale lemon yellow colour. The Polyantha variety Orange King was also well shown.

Mr. T. ROBINSON, Nottingham, set up a bold exhibit of stands and baskets of capital flowers of Lady Pirrie, Shot Silk, Col. O. Fitzgerald, Mrs. H. Stevens, K. of K. (very fine), Emma Wright, Mrs. Henry Bowles, Christine and Madame Butterfly. The front of this exhibit was finely furnished with flowers and Rose foliage.

Messrs. A. WARNER AND SONS adopted a different method of display from most other exhibitors and arranged bunches of blooms against a background of black velvet. Prominent varieties were Shot Silk, W. F. Dreer, Elsie Poulsen, Betty Uprichard, Madame Herriot, Lady Roundway, Lady Inchiquin, Emma Wright and Golden Emblem.

Conspicuous in the centre of Messrs. WATERER, SONS AND CRISP's bold display was an arch of the soft yellow Phyllis Bide. Other sorts shown in bold masses were Covent Garden, K. of K., Mrs. H. Stevens, Salmon Spray, Lady Inchiquin, Elsie Poulsen, Lady Pirrie, of excellent colour, and Shot Silk.

Messrs. WHEATCROFT BROTHERS showed good blooms of The Queen, Alexandra Rose, Souv. de Claudius Pernet, Angele Pernet, Los Angeles (very fine), Madame Butterfly, Betty Uprichard, Gwenneth Jones, Ophelia—a richly coloured sport from Emma Wright, and a dark sport from Lady Pirrie, both unnamed.

Messrs. FRANK CANT AND Co.'s display was a bold one, and a fine basket of Golden Emblem figured in the centre, while behind it were stands of Mrs. Henry Bowles, Phyllis Bide and Betty Uprichard. In addition, there were good examples of La Reine Elizabeth, a deep red polyantha variety; Ophelia, Shot Silk, Los Angeles and Orange King.

Messrs. CHAPLIN BROS. had a handsome display of tall stands arising among low borders of very clean and bright flowers. A few outstanding sorts were Waltham Cross, a more brilliant K. of K., the white Innocent, Shot Silk, Ophelia, Lady Inchiquin, Los Angeles, Madame Abel Chatenay, Golden Emblem, Emma Wright, Covent Garden, Princess Elizabeth of Greece and William Chaplin, a new, fragrant, crimson sort.

Messrs. WALTER EASLEA AND SONS' arrangement needed a few more flowers along the front. The leading varieties shown by this firm were Rev. F. Page Roberts, Mrs. Henry Bowles, Betty Uprichard, the dainty Mermaid, Los Angeles, William F. Dreer (very fine), Angele Pernet and Madame Abel Chatenay.

The golden yellow variety Cecil was conspicuous in the centre of Messrs. BENJAMIN CANT AND Co.'s exhibit, while there were also fine examples of Shot Silk, Mrs. Beatty, Red Star, Madame Butterfly, Emma Wright, Lady Pirrie, Scarlet Climber and Henrietta.

Messrs. WOOD AND INGRAM made a bold display of Angele Pernet, and their numerous flowers were very fresh and of fine colour; this firm also exhibited Shot Silk, Christine, Etoile d'Holland and Florence Izzard.

CHRYSANTHEMUMS.

The early-flowering Chrysanthemums were shown in rather greater quantity than last year, and there were some exceedingly good collections of this valuable autumn flower. Messrs. PUTTRIDGE, LTD., staged generously filled stands with well-grown flowers of the best varieties, including Bedford Beauty, Charlotte Harley, September White, Phoenix, Shirley Bronze, Wembley and Cranford Cream. Mr. H. WOOLMAN associated his Chrysanthemums with Dahlias and his chief varieties were Red Ensign, Radio and Mrs. Jack Pearson.

There was a wealth of blossom in the large exhibit of Messrs. KEITH LUXFORD AND Co. which was composed almost solely of sprays. They used, with effect, Cranford Cream, Mrs. Jack Pearson, Perle Chatillonnaise, Pink Profusion, September Yellow and J. Bannister. Mr. W. M. YANDELL also staged a good collection of early-flowering varieties, and he set up vases of Crimson Circle, September Glory, Harvester, Sanctity, Red Almirante and Bronze Buttercup.

STOVE AND GREENHOUSE PLANTS.

One of the most graceful exhibits in the hall was the group so delightfully arranged by Messrs. JOHN PEED AND SON. This was on the best exhibition lines; grace and elegance were provided by the well-grown plants of Humea elegans and Palms. Many Caladiums, with large leaves of great delicacy and beauty, Codiaeums (Crotons) in variety and of good colour, and Hydrangeas, both of the Hortensia and H. paniculata types were freely used, and there were also little batches of Streptocarpus and Achimenes coccinea. Ficus repens and Ferns made a fitting groundwork, and there were occasional specimens of Liliums and well-coloured Nandina domestica.

Seldom, if ever, have Messrs. BLACKMORE AND LANGDON shown the double-flowered, tuberous-rooted Begonias, for which they are so justly famed, better than on the present occasion. The flowers were truly "prodigious" and, although enormous, were of the highest possible quality. Of the many sorts on view, we especially admired Mabel Langdon, rich orange-pink; Hilda Langdon, soft pink; Mrs. E. Ramsden, deep rose; Lady Ann, medium pink; Corientia, rose; Peace, cream; and Sir J. Reid, orange.

In a large circular group, Messrs. SUTTON AND SONS displayed a large number of double-flowered Begonias from seed sown in January of this year. The flowers were, naturally, smaller than those of the above collection, but they were of good form and illustrated a very desirable strain. They were set out in radiating batches of distinct colours, such as orange-scarlet, orange-yellow, crimson, pink, and there was a collection of equally good plants of Duplex seedlings.

A circular space of similar size to the above was filled by Messrs. CARTER AND Co., where they made an attractive display with a centre of Liliums and Clerodendron fallax bearing huge compact heads of brilliant flowers, surrounded by a great many distinct varieties of Begonia of the B. semperflorens type. The most showy varieties were Prima Donna, Broadcast and Bedding Queen. This most pleasant group was surrounded by a broad edging of rich green seedling grass.

On the staging, Messrs. R. AND G. CUTHBERT displayed a good strain of Streptocarpus, interspersed with vivid scarlet heads of Rochla falcata. A particularly interesting collection of succulent plants was shown by Mr. SYDNEY SMITH. This was mostly in small plants, and a large variety was set out. The specimens included Echinocactus Grusonii, Opuntia robusta, Mamillaria perbella, Cereus flagelliformis, Echinocactus cristata and various Gasterias. He also staged a splendid variety of Echeverias and Mesembryanthemums. Messrs. GEORGE BUNYARD AND Co. contributed an interesting collection of uncommon Fuchsias growing in relatively small pots. The many sorts included Fuchsias Thompsonii, F. gracilis and varieties, F. Riccartonii, F. conica, F. longipedulata and mimosa.

Greenhouse Carnations were shown in considerable quantity by Messrs. C. ENGELMANN, LTD., Messrs. ALLWOOD BROTHERS and Messrs. STUART LOW AND Co., and these made a very

bright display. The first-named had large vases of Master Michael Stoop, Spectrum, Laddie, Red Laddie, Coral Glow, White Pearl, Topsy and Nero, while the last-named gave prominence to Happidais, an orange-coloured variety; Queen Mary, very dark maroon; Daphne, a mauve and heliotrope Fancy; and Ruby Glow. The chief sorts staged by Messrs. ALLWOOD BROTHERS were Maud Allwood, White Pearl, Laddie, Red Laddie, Maine Sunshine and Eldorado. They also had pans of the free-flowering Dianthus Allwoodii.

DAHLIAS.

The many collections of Dahlias filled a considerable amount of space, and provided brilliant masses of colouring. A large, circular group, arranged by Messrs. DOBBIE AND Co., was especially successful and was one of the best features of the show. Their many varieties included Joan Fife, Rosie Supreme, Moorkoop and Dazzle of the small, Paeony-flowered type; Sheila, Gloriosa, Glen Devon and Tuscar of the Colletettes; Pink Coltness, Dinkie, Peter Pan and Paisley Gem of the dwarf, single-flowered varieties. They also had equally good examples of other types.

An imposing display of excellent Dahlias was made by Messrs. W. M. TRESEDER, LTD., who arranged tall stands of J. Emberson and Andreas Hofer, of the Cactus type; Aristocrat, Trentonian and Jersey Beauty of the large Decorative section; while along the front they had smaller vases of Portia, Dazzle and Bishop of Llandaff.

Mr. H. J. JONES made a very graceful display with his Dahlias, which were arranged with sprays of Gypsophila paniculata and grasses. He included vases of George Duncan, Andreas Hofer and Forest Maiden, Cactus varieties; Jersey Beauty, Jack Hobbs and Robert Treat, of the large Decorative varieties; and also had tiny Pompon varieties. Mr. J. B. RIDING staged particularly good blooms. His chief sorts were Jersey Beauty, Jack Hobbs, Gold Rush, Madame E. Ludwig, Berengaria and Purple King, large Decorative; Glory, Fairy, Cathe and Mac of the small Paeony-flowered types. The Cactus varieties were displayed by Messrs. JARMAN AND Co., who included Edgar, S. Jackson, Madame C. Good and Andreas Hofer while they also staged flowers of the other sections.

The miniature Paeony-flowered varieties were prominent in the collection of Mr. J. T. WEST, whose varieties included Lady Godfrey Faussett, Winter Sun, Dazzle, Modiste and Beacon. Of the large Decoratives he had Border Perfection, Jersey Beauty and Mabel Lawrence.

A select little collection, arranged by Messrs. JAMES STREDWICK AND SON, included specimen blooms of recent novelties, such as Canberra, W. D. Cartwright and Leviathan, large Decoratives; F. W. Fellows, Doreen Woolman, Nanette and Mrs. Fred Warner, Cactus varieties. Messrs. CARTER PAGE AND Co. gave prominence to Harry Strutt, Pink Favourite, Clothilde, Fireman and Jersey Beauty. In a large and well-arranged collection, Messrs. DICKSON AND ROBINSON had many beautiful flowers of the small Paeony-flowered section, such as Espoir, Lady Mary Hope, Hilda M. Wheeler, Topsy and Peggy. They also had equally good varieties of the large Decorative and Cactus sections.

In addition to the vases of Dahlias associated with his early-flowering Chrysanthemums, Mr. H. WOOLMAN filled a considerable space with Dahlias alone. He staged Mabel Lawrence, E. Vandermeer and Noble, of the large Decoratives, and a representative selection of Cactus and Pompon varieties. Messrs. REG. WINDER, LTD., showed Siskiyu, Mephistopheles, Nagel's Ideal and Roi de Jaune. Messrs. D. PRIOR AND SON and Mr. H. CLARKE set up good Dahlias.

Messrs. H. LANGRIDGE AND Co., Westerham, Kent, showed Dahlias as a very dainty exhibit with a few big epergnes of Michaelmas Daisies.

A very big exhibit of Dahlias and border Chrysanthemums was shown by the KING'S ACRE NURSERIES. The Dahlias represented the best sorts in all sections. A big stand of the white Miss Krelage mixed with the scarlet Coronation made a pleasing contrast of colours. E. F. Hawes, a pink Cactus variety, Pink Favourite, large Decorative, Yellow King, Aldenham, Moercap, Dempsey and Yellow Colosse were

very prominent. The Chrysanthemums included a seedling from Dick Barnes, a small, circular bloom of dark chestnut-crimson colour named Crimson Circle. September White, Goldfinder and Mrs. Phil Page are other notable Chrysanthemums shown well by this firm.

Messrs. J. G. BALLEGO AND SONS, Bloemhove Leiden, Holland, showed Dahlias, including Apoldro, a Zinnia-flowered variety of bright red colour and Miniature, a pretty small Cactus variety of pink colour.

HARDY FLOWERS.

The exhibits of hardy flowers constituted the most numerous of the exhibits, and most of them contained varieties of Michaelmas Daisies. A few rock gardens were shown, but none was of outstanding importance.

Messrs. BUNYARD AND CO., LTD., showed great sheaves of Michaelmas Daisies, Helenium autumnale, early-flowering Chrysanthemums, Coreopsis, Anemone japonica, Rudbeckias, and other late border flowers. They showed a new variety of Aster Amellus named Hermann Lons, a big flower of soft mauve colour. They also had, as a separate exhibit, a collection of hardy Fuchsias.

Mr. G. LUBBE, Oegstgeest, Holland, showed seedling Tritomas raised from *T. hybrida alba*. The best were Fireflame (*Vuurvlam*), rich yellow, heavily marked with deep orange, a fine, glowing colour; *Coleur Cardinal*, dark red; *rosea*, delicate rose blush; and *Lucifer*, deep orange.

Mr. ERNEST BALLARD, Colwall, showed a good group of Michaelmas Daisies, of which he has raised so many notable varieties. Ruby Tips, a pretty pink, semi-double variety; Mrs. Geo. Monro, double white; Snowdrift, Empress of Colwall, rosy-mauve; Maid of Athens, double, blue; Margaret Ballard, rosy-mauve; and Grey Lady, were notable varieties in his collection.

Mr. R. J. CASE, Taunton, showed border flowers, including *Coreopsis auriculata superba*, *Lysimachia longifolia*, Aster King George and *Gaillardia grandiflora*. Numerous varieties of Zonal Pelargoniums were interspersed amongst the border flowers.

Messrs. W. H. ROGERS AND SON, Southampton, displayed a big group of hardy flowers in which we noticed fine specimens of *Campanula fenestrellata*, *Gentiana Farreri*, *Chrysogonum virginicum*, *Dianthus Emile Pari*, *Geum Borisii*, *Campanula muralis major* and a host of other fine plants, with many dwarf shrubs and Conifers.

Messrs. H. J. JONES, LTD., had a most imposing group of Michaelmas Daisies and *Helianthus Monarch*, adjoining their fine group of Dahlias. Effective in arrangement, first-class in quality, and representative of the choicest sorts, this beautiful exhibit was greatly admired.

Messrs. HEWITT, Solihull, showed border flowers in variety in association with choice Dahlias. Their Delphiniums, such as Rose Marie, George Cochrane, Mrs. Townley Parker and Norah Ferguson, were especially good.

Mr. WILLIAM YANDELL, Maidenhead, had a large and representative collection of border Chrysanthemums.

Michaelmas Daisies, Phloxes, Pentstemons and Dahlias were shown by Mr. JOHN FORBES, Hawick. The Pentstemons, in which this grower specialises, were outstandingly good, and included such sorts as Lambert Middleton, James Gibson, Mrs. Grenander, Col. Joicey and Mrs. Shakespeare.

Mr. AMOS PERRY, Enfield, had one of the most noteworthy exhibits of hardy flowers, arranged as a floor group. It was an ensemble of beautiful border flowers, including choice sorts of Michaelmas Daisies, Tritomas, *Liatris pycnostachys*, *Lilium Henryi*, *Artemisia lactiflora*, Pentstemon White Bedder, *Pyrethrum Aegeon* and *Cimicifuga Simplex*. The inclusion of choice hardy Ferns added much interest, and the edging of dwarf Conifers and Ericas was in good taste.

Messrs. BAKERS, Wolverhampton, arranged, against a background of Michaelmas Daisies, a choice assortment of border flowers, such as *Kniphofias* H. G. Mills, *Verbascum Cotswold Beauty*, Phlox Light of Codsall, *Sidalceas*, *Delphinium King George* and *Liatris pycnostachys*.

Messrs. GEO. JACKMAN AND SON, Woking,

arranged border flowers as an edging to their fine exhibit of Clematis. Michaelmas Daisy Kate Bloomfield is a gorgeous variety of rosy-pink colouring.

An exhibit wholly of Michaelmas Daisies was shown by Mr. T. BONES, Cheshunt, who has raised many noted varieties of these autumn flowers. Ultramarine is a fine blue variety, and Queen Mary of the Amellus type, exceptionally large and of rich lavender blue. Barr's Pink, Maid of Athens, Freedom, Kate Bloomfield, Anita Ballard and Royal Blue are others of high merit.

Mr. WILLIAM SYDENHAM, Derby, showed many beautiful varieties of Michaelmas Daisies.

Mr. GAVIN JONES, Letchworth, showed a floor group of hardy border flowers, and adjoining this group was a collection from Messrs. WATERER, SONS AND CRISP, Twyford, Berkshire.

Messrs. M. PRICHARD AND SONS, Christchurch, had a varied and beautiful assortment of border flowers, in which the rich golden *Helianthus Monarch* showed conspicuously. The beautiful *Pyrethrum James Kelway*, Aster Amellus Rudolph Goethe, *Poterium obtusum*, *Kniphofia Mount Etna*, Rudbeckia, The Pilot and Solidago Golden Wings are other flowers of special merit.

Messrs. J. CHEAL AND SONS, Crawley, arranged a bank of hardy flowers next to their group of shrubs and trees. *Actinomeris virginica* is a pretty Composite, like a miniature golden Rudbeckia. Aster Royal Blue and the very large flowered King George were conspicuous in this group.

Messrs. CARLILES NURSERIES, Loddon, filled a large table with hardy border flowers. Aster hybridus luteus, *Kniphofia aloides erecta*, Aster Royal Blue, *Salvia nemorosa* and *Coreopsis auriculata* are a few of the choicer plants shown by this firm.

Mr. G. G. WHITELEGG had vases of Asters, Gladioli, Aster linostris and pans of alpines.

Mr. AMOS PERRY displayed a collection of aquatics similar to the one for which he was awarded a Gold Medal at the fortnightly meeting on August 30.

The bowls of aquatics with fish were greatly interesting. *Valisneria spiralis*, *Cabomba* sp. *Ludwigia palustris*, *Elodea densa*, *E. crispata*, *Callitriche autumnale*, *Cerastophyllum demersum*, *Cabomba caroliniana*, *Myriophyllum spicatum* and *Potamogeton densus* are a few of the more interesting water "weeds" in the bowls.

Mr. G. REUTHE, Keston, had a variety of hardy border flowers and alpines, the most conspicuous of which was a box of *Colchicums* in variety, *C. speciosum atro-rubens*, *C. s. album*, *C. autumnale album*, *C. Bornmulleri* and *Crocus speciosus*. He had two pans of *Gentiana sino-ornata* in flower.

Messrs. BARR AND SONS exhibited a group of their beautiful Michaelmas Daisy Barr's Pink, with a few plants of *Schizanthus* Mrs. Hegarty and *Coreopsis auriculata superba*.

Messrs. E. F. FAIRBAIRN AND SONS, Carlisle, showed choice border Phloxes, of which the more notable sorts were The King, Vivid, Mrs. J. C. Maude, Border Gem, Europe, Lord French and Fairbairn's Triumph.

Mr. BALDWIN PINNEY, Shipbourne, near Tonbridge, Kent, exhibited varieties of Violets. Mr. J. J. KETTLE, also showed varieties of Violets.

Mr. JAMES MACDONALD's grass garden was quite a dainty garden with small beds of Ericas and Berberismixed with beautiful grasses; raised bank at either end were planted with *Eulalia saccharifera*, *Panicum plicatum*, *Eragrostis elegans*, *Eulalia japonica*, Zebrina and the Golden Pampas Grass.

Messrs. ISAAC HOUSE AND SON, Westbury-on-Trym, showed Aster luteus, *Kniphofias* and other border flowers in association with *Scabiosa caucasica*.

Messrs. SKELTON AND KIRBY, Pirbright, showed a good selection of Michaelmas Daisies, as well as *Gentiana acaulis*, *G. sino-ornata* and *Cyclamen neapolitanum*.

Messrs. W. WELLS AND CO., Merstham, showed some of the choicer sorts of Michaelmas Daisies, such as Margaret Ballard, Royal Blue, Mrs. George Monro, Barr's Pink, Little Boy Blue and King of the Belgians.

Mr. F. GULLICK, Salisbury, showed Michael-

mas Daisies, Tritomas, Chrysanthemums, *Pyrethrums*, *Helenium Riverton Beauty*, *Artemisia lactiflora* and other border flowers.

Mr. F. W. RICH, Worcester, showed Michaelmas Daisies and Solidago Ballardii. The last is larger-flowered than the old Golden Rod, and a fine bright yellow. The new Margaret Ballard Aster is a fine double, rosy-mauve variety.

Messrs. DANIEL BROS., Norwich, showed Montbretia His Majesty next to their exhibit of Roses.

Messrs. BOWELL AND SKARRATT, Cheltenham, had, in the forefront of their exhibit of herbaceous plants, a pool planted with Water-Lilies.

Messrs. G. GIBSON AND CO., Bedale, had a floor group of hardy border flowers, surmounted by grand spikes of Tritoma Mount Etna.

Messrs. BLACKMORE AND LANGDON had late spikes of Delphiniums of such varieties as Monarch of All, Lady Gwendolyn, Robert Cox, Pannonia, Phyllis and Mrs. H. Kaye. Messrs. WILSON AND AGAR, Reading, showed Michaelmas Daisies, Chrysanthemums, Dahlias and other hardy flowers.

Hardy border flowers were also shown by the CHALK HILL NURSERIES, Reading; Messrs. HARKNESS AND SONS, Bedale; Messrs. LOW AND GIBSON; Mr. G. W. MILLER, Wisbech; Messrs. W. CUTBUSH AND SON, Highgate; Mr. F. G. WOOD, Ashted; Messrs. W. H. SIMPSON, AND SONS, Birmingham; CENTRAL GARDEN SUPPLIES, LTD.; Messrs. RICH AND COOLING, Bath; THE ORPINGTON NURSERIES, LTD., Messrs. R. NEAL AND SONS, Sevenoaks, Messrs. SMAL AND CO., 28, Lime Street, London. Messrs. RICH AND COOLING, Bath, and Mr. W. KEMP, Enfield.

ROCK GARDENS AND ALPINES.

A very pleasing rock-garden was arranged by Mr. W. E. T. Ingwersen, Sharpthorne, Sussex, in which we noticed fine specimens of *Crocus speciosus album*, *Campanula Miranda*, *Crassula sarocaulis*, *Gentiana sino-ornata*, and many dwarf Conifers including *Juniperus communis compressa*, *Abies Remontii* and *Pinus montanus Mughus*.

Adjoining this exhibit was a similar one by the BACKHOUSE NURSERIES, LTD., York. This was a well arranged and effectively planted rockery, in which *Cyclamen hederacifolium album*, *Campanula gargantica* Payne's variety, *Rosa pumila*, *Colchicum speciosum album*, *Sternbergia lutea*, and a large number of dwarf Conifers were used to good effect.

Messrs. MAXWELL AND BEALE, Broadstone, showed alpines on a rockery arranged on tabling. Such rock-garden plants as *Gentiana acaulis*, *Erigeron Asa Gray*, *Erica vagans* Lyonesse, Aster acris nanus and Papaver alpinum were disposed amongst stone work and in one corner was a big colony of *Colchicum autumnale* in variety.

Mr. CLARENCE ELLIOTT, Stevenage, used old Westmoreland stone in a rock-garden exhibit on a table and planted it effectively with *Colchicums*, *Fuchsia pumila*, *Nerembergia rivularis*, *Gentiana Farreri*, *Polygonum affine* and other late alpines with dwarf Pines and Junipers.

Mr. H. HEMSLEY, Crawley, had a rockery planted with a variety of Alpines and, at the back, varieties of his choice strain of *Sidalcea*. *Geum Borisii*, *Campanula rotundiflora hybrida*, *Saussurea alpina*, *Tunica Saxifraga alba plena* and many other pretty late-flowering Alpines were planted at appropriate spots amongst the stones.

The Misses K. and E. HOPKINS, Coulsdon, put up a small rockery furnished with late-flowering Alpines.

A rock garden was also exhibited by Mr. ERNEST DIXON, Putney.

HARDY TREES AND SHRUBS.

There were many collections of miscellaneous hardy trees and shrubs and, while autumn colouring was not so prominent a feature as last year, there were many shrubs with brilliant fruits and an appreciable number of species and varieties in flower. Messrs. HILLIER AND SONS had a large exhibit in which they placed large examples of *Quercus coccinea splendens* in autumn colour, *Pistacia chinensis*, with its graceful, Fern-like foliage beautifully tinted,

Acer palmatum atropurpureum, *Viburnum Sieboldi*, *Vitis Coignetiae* and *Vitis sinensis* with coloured foliage.

An admirable group was also arranged by Messrs. WALLACE AND CO., who placed three tall specimens of Golden Cypress along the centre and included Japanese Maples, *Rosa Moyesii* bearing bright hips, various Clematis, *Lilium auratum* and Autumn Crocuses. Conifers were freely shown by Messrs. FLETCHER BROTHERS, who also grouped *Cotoneaster Simonsii*, *C. horizontalis*, *Berberis Wilsonae* and *Pyracantha Lelandii* in full fruit. Messrs. HOLLAMBY'S NURSERIES had tall examples of various Vitis, especially *V. Coignetiae*, shrubby *Spiraeas*, *Cornuses* and *Ericas*.

Many well-flowered Clematis were grouped by Messrs. G. JACKMAN AND SONS, whose varieties included *Nellie Moser*, *Belle Nantaise*, *Gipsy Queen*, *Lady Northcliffe*, *The President*, *Otto Froebel* and *Mrs. Hope*. They also had a collection of *Michaelmas Daisies*. A pretty little group was displayed by Messrs. MAXWELL AND BEALE, who arranged various *Ericas* and *Menziesia polifolia*. Mr. H. HEMSLEY had a well-coloured specimen of *Enkianthus campanulatus* and *Ampelopsis Veitchii*, with *Symphoricarpos racemosus*, dwarf Conifers and *Veronicas*. Messrs. L. R. RUSSELL, LTD., grouped Clematis with Vitis, Cotoneasters and other shrubs.

Japanese Maples, ornamental Vines, *Cotoneaster rugosa Henryi*, *Pyrus Eleyi*, *Desmodium penduliferum*, *Salvia coerulea* and various Conifers were shown by Messrs. A. CHARLTON AND SONS. On the staging, the ORPINGTON NURSERIES set out a good variety of shapely little Conifers of the type valued for the rock garden, and near by Messrs. STEWART AND SON showed Cotoneasters and Veronicas. Messrs. R. NEAL AND SONS had small Conifers, *Ericas* and other shrubs, while Miss GLADYS HOUSE exhibited miniature gardens.

In a flower group, Messrs. J. CHEAL AND SONS arranged *Ceanothus Gloire de Versailles*, *C. Marie Simon*, *C. Americanus*, *Menziesia polifolia*, *Escallonia floribunda*, *Hydrangeas*, Japanese Maples and Conifers. Mr. G. G. WHITELEGG had a goodly group of shapely Conifers, chiefly of species and varieties of *Pinus Cupressus*, *Picea* and *Taxus*, and a few berried shrubs. Mr. R. C. NOTCUTT displayed *Pyrus Eleyi*, *Stranvesia Davidiana*, *Berberis subcauliculata*, *Ceanothus Gloire de Versailles*, *C. Albert Pettet*, *Abelia rupestris* and *Pernettya* hybrids.

Several excellent specimens of *Euonymus yedoensis* bearing its beautiful fruits were included in their group by Messrs. WATERER, SONS AND CRISP. They also showed *Berberis Unique*, *B. Thunbergii*, *B. lucida*, *Actinidia chinensis*, Conifers and Vitis. Mr. G. REUTHE had many *Rhododendrons* which, though not in flower, illustrated great value for their luxuriant foliage. Those with the largest leaves were *R. praestans*, *R. pentamerum*, *R. grande* and *R. Elizabethae magnificum*. He also showed flowering sprays of *Hoheria popunea*, *Cyrilla racemiflora*, *Magnolia grandiflora*, *Lapageria rosea*, *Ericas* and shrubby *Veronicas*. Messrs. ROBERT GREEN, LTD., had a good collection of Bay trees in various forms.

Messrs. R. NEAL AND SONS, LTD., Sevenoaks, exhibited *Ericas*, Conifers, *Hypericum patulum*, *Pernettyas*, and other shrubs in the gallery.

Fruit and Vegetable Committee.

Present: Mr. A. H. Pearson (chairman), Mr. P. C. M. Veitch, Mr. W. Lobjoit, Mr. E. A. Bunyard, Mr. W. F. Giles, Mr. E. Neal, Mr. H. Prince, Mr. J. Wilson, Mr. E. A. Laxton, Mr. W. H. Divers, Mr. A. W. Metcalfe, Mr. Geo. F. Tinley, and Mr. A. N. Rawes (Secretary).

A seedling Plum of the *Monarch* type was shown by Mr. G. W. LAYLEY, Halffoot Farm, Beenham, Reading. It was recommended that the variety be included in the trial of commercial fruits at Wisley.

FRUITS.

Mr. J. C. ALLGROVE, Langley, Slough, showed a magnificent collection of hardy fruits, including Apples, Pears and Plums. The quality of the fruits was exceptionally high, but the tabling was too narrow to admit of displaying them to the best advantage. Of Apples there were grand specimens of *Cox's Orange Pippin*, *Allington Pippin*, *Rival*, *Charles Ross*, *Blue Pearmain*,

Mabbot's Pearmain, *S. T. Wright*, *Worcester Pearmain*, *Ellison's Orange*, *King Harry King* of the *Pippins* and *Ben's Red*.

Messrs. EDWARD J. PARSONS AND CO., Worcester, also displayed choice fruits of Apples, Pears and Plums, with several pretty baskets of berried sprays of *Berberis* for relief. They had fine Apples of such sorts as *Newton Wonder*, *Lord Suffield*, *Royal Russet*, *Warner's King*, *James Grieve*, *Annie Elizabeth* and *Charles Ross*. Messrs. STUART LOW AND CO. showed pot Fig trees of the *White Ischia* variety.

The BARHAM NURSERIES, LTD., had exceptionally big and choice Apples. The outstanding variety was *Charles Eyre*, a big golden Apple of the *Royal Jubilee* type. Others of merit were *Ribston Pippin*, *Rival*, *Bramley's Seedling*, *Egremont Russet*, and *Charles Ross*.

Messrs. G. BUNYARD AND CO., LTD., displayed a variety of choice hardy fruits, also small berried Grapes grown in a cold house. This well-arranged exhibit contained a good selection of both culinary and dessert Apples, also choice Pears, Plums, Crabs and Nuts. A central stand of hanging baskets contained *Ben's Red* Apples of intense colouring. The Plums were exceptionally good.

A. P. BRANDT, Esq., Bletchingley, Surrey (gr. Mr. J. W. Barks), exhibited eighteen fine bunches of *Grape Golden Queen* which obtained the R.H.S. First Class Certificate in 1873. It was raised from *Alicante* crossed with *Ferdinand de Lesseps*. At the back was a row of pretty foliage plants. Messrs. W. SEABROOK AND SONS, Chelmsford, showed splendid Apples of varieties specially suited to commercial growers.

Mr. J. J. KETTLE, showed fruiting sprays of Raspberries, Peaches *Salway* and *Lady Palmerston* were shown well by Mr. A. T. GOODWIN, *Roseholme*, *Maidstone*.

VEGETABLES.

Messrs. THYNNE AND SON, Dundee, exhibited some forty varieties of Potatoes, including the new early non-immune variety, *The Baron*, which gained a Gold Medal at Ormskirk in 1927.

Awards by The Council.

CUPS.

The Coronation Cup, offered for the most meritorious group in the show, was awarded to Messrs. BLACKMORE AND LANGDON, for a group of *Begonias*.

The Wigan Cup, offered for the best exhibit of Roses, was awarded to Messrs. S. MCGREDY AND SON.

Silver Cup.—To Messrs. ALLWOOD BROS., for Carnations; to Messrs. J. PEED AND SON, for greenhouse plants; to Messrs. DICKSON AND ROBINSON, for Dahlias; to Mr. J. B. RIDING, for Dahlias; to Messrs. W. TRESEDER, LTD., for Dahlias; to Mr. J. C. ALLGROVE, for fruit; to the BARNHAM NURSERIES, LTD., for fruit; to Messrs. J. CHEAL AND SONS, LTD., for shrubs; to Messrs. HILLIER AND SONS, for trees and shrubs; to Mr. G. PRINCE, for Roses; and to Mr. T. ROBINSON, for Roses.

MEDALS.

Gold Medal.—To Messrs. C. ENGELMANN, LTD., for Carnations; to Messrs. BLACKMORE AND LANGDON, for *Begonias*; to Messrs. DOBBIE AND CO., for Dahlias; to Messrs. G. BUNYARD AND CO., LTD., for fruit; and to Messrs. S. MCGREDY AND SON, for Roses.

Silver-Gilt Flora Medal.—To Messrs. AUSTIN AND MCASLAN, for Gladioli; to Messrs. STUART LOW AND CO., for Orchids; to Messrs. STUART LOW AND CO., for Carnations; to Messrs. JAMES CARTER AND CO., for greenhouse flowering plants; to Messrs. SUTTON AND SONS, for *Begonias*; to Messrs. JARMAN AND CO., for Dahlias; to Mr. H. J. JONES, for Dahlias; to Mr. G. REUTHE, for trees and shrubs; to Messrs. CHAPLIN BROS., LTD., for Roses; to Messrs. ALEX. DICKSON AND SONS, for Roses; to Messrs. G. JACKMAN AND SON, for Clematis and herbaceous plants; to Messrs. L. R. RUSSELL, LTD., for Clematis, hardy climbers and miscellaneous plants; and to Messrs. R. WALLACE AND CO., LTD., for shrubs, bulbous plants and hardy flowers.

Silver-Gilt Banksian Medal.—To Mr. S. SMITH,

for Cacti, succulents and miniature gardens to Messrs. CARTER PAGE AND CO., for Dahlias; to Messrs. J. STREDWICK AND SON, for Dahlias; to Mr. J. T. WEST, for Dahlias; to Mr. H. WOOLMAN, for Dahlias; to Messrs. A. CHARLTON AND SONS, for trees and shrubs; to Messrs. MAXWELL AND BEALE, for a Heath garden; to Mr. R. C. NOTCUTT, for shrubs; to Messrs. J. WATERER, SONS AND CRISP, LTD., for shrubs and Conifers; to Messrs. B. R. CANT AND SONS, LTD., for Roses; to Mr. E. J. HICKS, for Roses; to Mr. J. H. PEMBERTON, for Roses; to Messrs. D. PRIOR AND SONS, LTD., for Roses; to Messrs. WATERER, SONS AND CRISP, for Roses; to Mr. W. WELLS, Junr., for *Michaelmas Daisies* and other herbaceous plants; to KING'S ACRE NURSERIES, for Dahlias and Chrysanthemums; to Mr. AMOS PERRY, for herbaceous plants; to Messrs. BAKERS, LTD., for herbaceous plants; and to Messrs. M. PRICHARD AND SONS, for herbaceous plants.

Silver Flora Medal.—To Mr. ERNEST BALLARD, for *Michaelmas Daisies*; to Mr. J. W. FORSYTH, for Chrysanthemums; to Messrs. K. LUXFORD AND CO., for Chrysanthemums; to Mr. W. YANDELL, for Chrysanthemums and Violas; to Messrs. R. WINDER, LTD., for Dahlias; to Messrs. J. CHEAL AND SONS, LTD., for Dahlias; to Messrs. R. GREEN, LTD., for Bay trees; to Mr. J. KLINKERT, for topiary; to Messrs. W. EASLEA AND SONS, for Roses; to Mr. J. MATTOCK, for Roses; to Messrs. A. WARNER AND SON, for Roses; to Messrs. W. CUTBUSH AND SON, for a mixed group of Dahlias and Pentstemons; to Messrs. ISAAC HOUSE AND SON, for Scabious, Kniphofias and herbaceous plants; to Messrs. HARKNESS AND SONS, for herbaceous plants; to Messrs. B. LADHAMS, LTD., for Lobelias and other herbaceous plants; to Messrs. J. WATERER, SONS AND CRISP, for herbaceous plants; to Mr. W. E. T. INGWERSON, for rock garden plants and dwarf Conifers; and to Mr. JAMES MACDONALD for a lawn garden.

Silver Hogg Medal.—To Mr. A. P. BRANDT, for Grapes; and to Mr. E. J. PARSONS, for fruit.

Silver Knightian Medal.—To Messrs. THYNNE AND SON, for Potatoes.

Silver Banksian Medal.—To Messrs. R. H. BATH, LTD., for Gladioli; to Messrs. R. AND G. CUTHBERT, for *Streptocarpus* and *Crassulas*; to Messrs. STUART LOW AND CO., for greenhouse plants; to Mr. C. TURNER, for Dahlias; to Messrs. FLETCHER BROS., for shrubs and Conifers; to the HOLLAMBY'S NURSERIES, for trees and shrubs; to Messrs. D. STEWART AND SON, for shrubs; to Messrs. FRANK CANT AND CO., for roses; to Mr. AMOS PERRY, for aquatic plants; to the ORPINGTON NURSERIES CO., for a mixed group of Gladioli and *Michaelmas Daisies*; to Mr. H. J. JONES, for *Michaelmas Daisies* and *Helianthus*; and to Messrs. CLARENCE ELLIOTT, LTD., for a rock garden.

Flora Medal.—To Mr. T. BONES, for *Michaelmas Daisies*; to Mr. W. SYDENHAM, for *Michaelmas Daisies*; to Mr. H. CLARKE, for Dahlias; to Mr. H. HEMSLEY, for trees and shrubs; to DOWTY'S ROSERY, for Roses; to Messrs. WOOD AND INGRAM, for Roses; to the CHALK HILL NURSERIES, for herbaceous plants; to Messrs. W. H. ROGERS AND SON, LTD., for a group of alpine plants, dwarf shrubs and herbaceous plants; and to Messrs. E. F. FAIRBAIRN AND SONS, for Phloxes.

Banksian Medal.—To the ORPINGTON NURSERIES CO., for dwarf Conifers and shrubs; to the BACKHOUSE NURSERIES, for a mixed group of dwarf shrubs and alpine plants; to Mr. F. G. WOOD, for a rock garden; to Mr. W. F. GULLICK, for herbaceous and bulbous plants; to Messrs. HEWITT AND CO., LTD., for a group of Delphiniums, Dahlias and herbaceous plants; to Messrs. WILSON AND AGAR, for Dahlias, Gladioli and Chrysanthemums; to Messrs. W. WOOD AND SON, LTD., for herbaceous plants; to Mr. F. RICH, for herbaceous plants; to Mr. H. WOOLMAN, for Chrysanthemums and Dahlias; to Messrs. BOWELL AND SKARRATT, for herbaceous plants; to Messrs. G. GIBSON AND CO., for herbaceous plants; and to Mr. GAVIN JONES, for herbaceous plants.

Hogg Medal.—To Messrs. S. LOW AND CO., for Figs; to Messrs. W. M. SEABROOK AND SONS LTD., for fruit.

ROYAL CALEDONIAN HORTICULTURAL.

SEPTEMBER 14 AND 15.—Notwithstanding the very unfavourable season, the autumn show of this Society, which was held in the Waverley Market, Edinburgh, on the above dates, was an exceptionally fine one, and was a pleasant surprise to most people who visited it. The fruit classes were not, as was to be expected, so well filled as usual, but the exhibits forthcoming were quite up to the average, and in the case of the twelve dishes of Apples set up by Mr. CHARLES WEBSTER, Gordon Castle Gardens—in the class for orchard house fruit—no finer fruits of the kind have ever been seen at these shows. The cut flowers were particularly good, most of the classes being well filled, while the vegetables were of a high standard. The trade exhibits were also numerous and of high merit. The total entries in the competitive classes were considerably in excess of those of last year, which were then the highest since pre-war years. The National Association of Allotment Holders again held its annual show in conjunction with the Society's show, and there also the exhibits were of a high standard. The show was formally declared open by Mrs. Wauchope, of Niddrie.

POT PLANTS.

For a table of tuberous Begonias, six feet by five feet, Mrs. DENNISTOUN MITCHELL, Carwood, Biggar (gr. Mr. J. Lyall), was awarded the first prize, and GEORGE DUN, Esq., Eastmount, Galashiels (gr. Mr. A. Aitken), was placed second.

The following were the first prize winners in the other classes for pot plants open to gardeners and amateurs: Three stove or greenhouse plants, GEORGE DUN, Esq.; two Coleus, Mrs. BEVERIDGE, Beechwood, Kirkcaldy (gr. Mr. P. Reid); three foliage plants, Mr. W. H. SHEPHERD, Edinburgh; four plants for table decoration, Mrs. MACKINNON, Auchmore, Killin (gr. Mr. J. Easson); four Streptocarpuses, Mrs. SELLARS, Drylaw House, Edinburgh (gr. Mr. W. Galloway); two tuberous Begonias (single and double), D. J. W. DUNDA, Esq., Woodhouselee, Midlothian (gr. Mr. A. Lauder); two Nephrolepis, Mr. W. H. SHEPHERD, Edinburgh; six dwarf hardy Ferns, Mr. A. OLIVER, Hawick; three exotic Ferns, Mrs. LUMGAIR, Rosalie, Hawick (gr. Mr. W. Black); two Zonal Pelargoniums, Mrs. M. MITCHELL, Gilmerton; three scented-leaved Pelargoniums, Mrs. M. MITCHELL; two Fuchsias, ROYAL VICTORIA TRUST, Liberton (gr. Mr. J. Douglas); two pots of Lilium, Mrs. DENNISTOUN MITCHELL; one pot of Vallota purpurea, Major C. R. GORDON, Threave House, Castle Douglas (gr. Mr. J. Duff); three pots of Chrysanthemums, Mr. CLAUDE JENKINS, Cambuslang; two Heliotropes, Mrs. SELLARS.

In the classes confined to amateurs, Mrs. M. MITCHELL excelled for two greenhouse plants, one tuberous-rooted Begonia (single), one Zonal Pelargonium, and one flowering plant; Mr. W. H. SHEPHERD, Edinburgh, for one foliage plant; Mr. J. ARNOT, Corstorphine, for one tuberous-rooted Begonia (double); Mr. D. LONIE, Gilmerton, for four hardy Ferns and one Fuchsia; Mr. R. KERR, Edinburgh, for one pot of Lilium, and Mr. CLAUDE JENKINS, Cambuslang, for one pot of Chrysanthemums.

ROSES.

In the open classes, Messrs. WHEATCROFT BROTHERS, Gedling, were placed first for six baskets of decorative Roses, and Messrs. J. FAIRLEY AND SON, Cairneyhill, Fife, second. Messrs. FAIRLEY also excelled for six vases of "Cluster" Roses. For thirty-six Rose blooms in not fewer than twenty-four varieties, and not more than two of any variety, Messrs. ADAM AND CARMYLE, Aberdeen, took first place, Messrs. D. AND W. CROLL, Dundee, being second. Messrs. T. SMITH AND SONS, Stranraer, excelled for twelve blooms of new Roses, distinct varieties, introduced in 1925 and after. In the classes for twelve Roses in the various colours, Messrs. D. AND W. CROLL excelled for twelve red or crimson blooms; Messrs. ADAM AND CARMYLE for twelve pink, and Mr. W. FERGUSON, Dunfermline, for twelve white and twelve yellow varieties respectively.

In the gardeners' and amateurs' classes, Major R. E. DAVIES, Glenlaggan, Kirkcudbright

(gr. Mr. F. Penfold), excelled for a collection of garden and decorative Roses, not fewer than twelve varieties, arranged for decorative effect on a table five feet square. He also excelled for twelve vases of Roses in twelve distinct varieties, and for twenty-four blooms in not fewer than eighteen varieties, and not more than two blooms of one variety. The EARL OF HADDINGTON, Mellerstain, Berwickshire (gr. Mr. W. A. Baldwin), was placed first for four vases of Roses, for three vases of Cluster Roses, and for one vase respectively of yellow and red or crimson Roses. Mr. J. PATERSON, Lamington, Lanark, excelled for a vase of pink Roses, and Major A. D. THOMSON, Nenthorn, Kelso (gr. Mr. W. Wilson), for a vase of a white variety.

In the classes confined to amateurs, Mr. J. PATERSON, Lamington, excelled for twelve blooms, not fewer than six varieties, and not more than two blooms of any variety, one vase of a rambler variety, one vase of six blooms, and one vase of any pink Rose.

DAHLIAS AND SWEET PEAS.

In the open classes Messrs. M. CAMPBELL AND SONS, High Blantyre, excelled for six vases of Cactus Dahlias. Mr. J. NISBET, Busby, excelled for three vases of the same flower, and Mr. W. HEATLY, Galashiels, excelled for one vase in the section confined to amateurs. In the classes for Collerettes, Mr. C. JENKINS, Cambuslang, excelled in the gardeners' and amateurs' classes for six vases, and Mr. R. GRANT, Bowness, for three vases in the class confined to amateurs. In the remaining classes for gardeners and amateurs, Mr. JENKINS excelled for four vases of Pompons, Mr. J. PATERSON, Chirnside, for three vases of Show blooms, and Mr. W. LOWRIE, Bowness, for three vases of single varieties. The *Gardening Illustrated* Medal for the best exhibit in the Dahlia section was awarded to Mr. CLAUDE JENKINS for his six vases of Collerettes.

For twelve vases of Sweet Peas, open to gardeners and amateurs, Mr. J. A. GRIGOR, The Woodlands, Banff, was placed first; and for six vases of these flowers Mr. E. E. DIXON, Dumfries, excelled. Mr. DIXON also excelled for three vases in the class confined to amateurs. In the open, single-vase classes, Mr. GRIGOR excelled for crimson, cream and orange-scarlet varieties; F. R. B. ELLIOT, Esq., Clifton Park, Kelso (gr. Mr. J. Darling), for a pink variety; and Sir W. H. MAY, Bughrigg, Coldstream (gr. Mr. J. Loan), for lavender and any other coloured varieties.

CARNATIONS AND CHRYSANTHEMUMS.

Mr. W. AITCHISON, Thurston Gardens, East Lothian, obtained the first prize for six vases of perpetual-flowering Carnations, and Mr. A. WALKER, Jedburgh, excelled for four vases of Border Carnations and Picotees.

In the open classes for Chrysanthemums, Mr. T. NEILSON, Rutherglen, was awarded the first prize and the Scottish Challenge Cup for a display of single and double flowers on a table ten feet by five feet, decorated with Ferns, etc., and Mr. R. GRANT, Bowness, was placed second. In the other open class, Mr. JENKINS excelled for six vases of early-flowering varieties. In the classes for gardeners and amateurs, Mr. J. NISBET, Busby, obtained the first prize for eight vases of early-flowering varieties, and also for one vase of white, one vase of yellow, one vase of crimson or bronze, and one vase of any other variety. Mr. J. STEVENSON, Melrose, excelled for one vase of single early-flowering varieties, whilst in the only class confined to amateurs, for three vases of early-flowering varieties, Mr. W. BISHOP, Inverkeithing, was successful.

GLADIOLI, PANSIES AND VIOLAS.

In the open class for twenty-four spikes of Gladioli, Messrs. G. MAIR AND SONS, Prestwick, were placed first, and Mr. D. WHITELAW, Laurencekirk, second. In the classes for gardeners and amateurs, Mr. WHITELAW excelled for twelve spikes, and Mr. J. M. CARRUTHERS, Corstorphine, for six vases of varieties of Primulinus. Mr. WHITELAW also excelled for six spikes in the class confined to amateurs.

In the Pansy and Viola classes, for gardeners and amateurs, Mr. A. FRATER, Kirkliston, excelled for twenty-four blooms of Fancy

Pansies, in not fewer than eighteen varieties, for twelve Show Pansies, and for twenty-four blooms of Violas in not fewer than eighteen varieties. Mr. H. ROBERTSON, Kelty, Fife, excelled for twelve sprays of Violas, and also for twelve blooms of Violas. Mr. A. FRATER also excelled for twelve Fancy Pansies in the class confined to amateurs.

HERBACEOUS AND OTHER FLOWERS.

In the gardeners' and amateurs' classes, the EARL OF HADDINGTON, Mellerstain, Gordon (gr. Mr. W. A. Baldwin), led for twelve vases of hardy herbaceous flowers, and also for six vases of Phloxes and three vases of Montbretia. Mrs. REID, Thomanean, Milnathort (gr. J. Mr. Pearson), was placed first for six vases of flowers from the open border; Major C. R. GORDON, for Michaelmas Daisies; Mr. J. RICHARDSON, Ford, Midlothian, for eighteen vases of cut flowers from the open, on a space of six feet by five feet, and for six vases of Pentstemons; LADY DUNDAS, of Arniston, Gorebridge (gr. Mr. R. Mackenzie), for six vases of Antirrhinums; Mr. H. MASON, Davidsons Mains, Edinburgh, for three vases of Scabiosa caucasica; Mr. W. BISHOP, Inverkeithing, for three vases of French Marigolds; Mr. W. T. LANDRETH, Coldstream, for two vases African Marigolds; A. CURRIE, Esq., Holylee, Walkerburn (gr. Mr. W. Redpath), for two vases of Single Asters; Mr. C. JENKINS, for two vases double Asters; Mrs. ASKEW ROBERTSON, Ladykirk, Norham (gr. Mr. G. Little), for three vases of Stocks; Mr. J. STEVENSON, Melrose, for eight vases of annuals; Mr. A. CURRIE, Newmills, for six blooms of double Begonias, and Mr. F. COWIE, Helensburgh, for a basket of autumn foliage and leaves. In the classes confined to amateurs, Mr. W. F. LANDRETH excelled for six vases of hardy herbaceous flowers, and four vases of hardy and half-hardy annuals, while Mr. W. R. BROWNLEE, Duns, excelled for two vases of Phloxes.

DECORATIVE CLASSES.

These classes were open to all competitors, and the first prize for a decorated dinner table ten feet by five feet, was awarded to MACPHERSON SMITH, Esq., Prestonfield, Edinburgh (gr. Mr. W. Lamb). Mr. J. MACKENZIE, Lochend Dunbar, was placed second, and Mr. E. E. DIXON, Dumfries, third. Miss SOPHIA JOHNSTON, Edinburgh, excelled for a shower bouquet of Roses, and Miss G. BREMNER, Edinburgh, for a shower bouquet of Carnations. Messrs. J. FAIRLEY AND SON were placed first for a bowl of Sweet Peas, and Mr. T. M. WHITEHEAD, Selkirk, for a bowl of Carnations.

FRUIT.

The EARL OF HADDINGTON, Yester, Gifford (gr. Mr. A. M'Bean), was the only entrant for a table of nine dishes of fruit, decorated, and was awarded the first prize of £5. The fruits shown were: Muscat of Alexandria and Gros Maroc (two bunches of each) Grapes, two dishes of Marguerite Marillat Pear, Princess of Wales and Bellegarde Peaches, Pineapple Nectarine and James Grieve Apple.

GRAPES.

As was the case last year, the EARL OF STRATHMORE, Glamis Castle, and the EARL OF BALFOUR, K.T., Whittingehame, were the only entrants for eight bunches of Grapes, not fewer than four varieties, and not more than two bunches of a variety, and the first prize of £4 and a gold badge, with the Thomson Challenge Trophy, was awarded to the EARL OF STRATHMORE (gr. Mr. D. M'Innes), who, having won it for the third time, now becomes the owner of the trophy. The points awarded to the EARL OF STRATHMORE's bunches were:—

| | | Max. Points. | Points Awarded |
|----|----------------------|--------------|----------------|
| 1. | Muscat of Alexandria | 10 | 9 |
| 2. | " | 10 | 9 |
| 3. | Mrs. Pince | 9 | 8 |
| 4. | " | 9 | 8 |
| 5. | Alicante | 8 | 6½ |
| 6. | " | 8 | 6½ |
| 7. | Black Hamburgh | 9 | 6½ |
| 8. | Gros Maroc | 8 | 5½ |
| | | 71 | 59 |

The bunches shown by the EARL OF BALFOUR (gr. Mr. G. F. Anderson), were two of Muscat of Alexandria, two of Directeur Tisserand, two of Appley Towers and two of Alicante, and the points awarded were fifty-five out of a possible sixty-eight.

In the class for four bunches, at least two varieties, and not more than two bunches of a variety, the EARL OF HADDINGTON was placed first, with 30½ points out of a possible 36; the EARL OF MAR AND KELLIE, Alloa House, Alloa (gr. Mr. W. J. Buchanan), was second, with 27½ points out of 36; and Sir E. WILLS, Meggernie, Glenlyon (gr. Mr. P. M'Onie), third, with 26½ out of 38. The EARL OF STRATHMORE also excelled for two bunches of Muscat of Alexandria, and for two bunches of Alicante. The EARL OF MAR AND KELLIE excelled for one bunch of Muscat of Alexandria, the EARL OF MORAY, Donibristle, Fife (gr. Mr. J. M'Kinna), for three bunches of Black Hamburgh; the EARL OF BALFOUR for one bunch of Appley Towers, two bunches of any other black Grape, with Directeur Tisserand; and one bunch for bloom, with Appley Towers. The EARL OF HADDINGTON excelled for one bunch of Gros Colmar and one bunch of Madresfield Court; R. B. BALLANTYNE, Esq., Ascogbank House, Bute (gr. Mr. H. Begg), for one bunch of Alicante, and Major C. R. GORDON, for two bunches of any other white Grape.

OTHER FRUITS.

For a collection of nine dishes of hardy fruit grown in the open, Sir R. D. MONCRIEFFE, Moncrieff House, Bridge of Earn (gr. Mr. A. W. M'Lean), was placed first. The DUKE OF RICHMOND AND GORDON, Gordon Castle, Morayshire (gr. Mr. C. Webster), excelled with a very finely finished lot of orchard-house-grown Apples in a class consisting of twelve dishes, in at least nine varieties, five fruits of each. The other entrant in the class, the EARL OF BALFOUR, was placed second. For a collection of Apples grown in Scotland, twelve varieties, five of each, the Hon. Mrs. ASKEW ROBERTSON, Ladykirk, Norham (gr. Mr. G. Little), led, and for a similar collection of six varieties, Sir R. D. MONCRIEFFE was placed first.

In the single dish classes for Apples grown in Scotland, Viscount CHURCHILL, Langlee, Galashiels (gr. Mr. J. Cochrane), excelled for Charles Ross; Major C. R. GORDON, for Newton Wonder, Worcester Pearmain and Grenadier; J. K. SPITAL, Esq., Roundelwood, Crieff (gr. Mr. J. M'Kinnie), for Irish Peach; J. J. BELL IRVING, Esq., Mackerston, Kelso (gr. Mr. R. Auldjo), for James Grieve, Golden Spuire and Stirling Castle, and six dessert Apples fit for table. Mr. G. ORMISTON, Musselburgh, led for Ecklinville Seedling; Admiral Sir W. H. MAY, Bughrig, Coldstream (gr. Mr. J. Loan), for Lane's Prince Albert and Rev. W. Wilks; Mr. T. NICOL, Earlston, for Peasgood's Nonesuch; Mr. J. P. REID, Averlady, for Lord Derby; Mr. R. KERR, Edinburgh, for Lord Suffield; Hon. Mrs. ASKEW ROBERTSON, for Warner's King; Mrs. M'KINNON, Auchmore, Killin (gr. Mr. J. Easson), for Bramley's Seedling; Sir R. USHER, Norton, Ratha (gr. Mr. A. Willsher), for any other dessert Apple grown in Scotland, and the EARL OF HADDINGTON, Mellerstain, Gordon (gr. Mr. W. A. Baldwin), for any other culinary Apple.

In the class for amateurs, Mr. R. KERR, Edinburgh, excelled for six cooking Apples, and Mr. W. GRAHAM, Kirkfieldbank, Lanark, for six dessert Apples.

For Pears grown in Scotland, Mrs. ASKEW ROBERTSON led for the collection of six varieties, and also for six fruits of Doyenné du Comice. Mr. J. MACKENZIE, Lochend, Dunbar, was first for Louise Bonne of Jersey, Souvenir de Congrès and Williams's Bon Chrétien. Admiral Sir W. H. MAY excelled for Conference; Mr. J. P. REID, Aberlady, for Durondeau; Captain PELHAM BURN, Inverail, Dirleton (gr. Mr. J. Law), for Jargonelle; and Sir R. D. MONCRIEFFE, for Pitmaston Duchess. Admiral MAY obtained the first prize for a collection of dessert Plums, and the EARL OF BALFOUR for a collection of culinary Plums. The EARL OF BALFOUR also excelled for twelve purple Plums, twelve Gage Plums, six Peaches and six Nectarines. The DUKE OF RICHMOND AND GORDON,

Fochabers (gr. Mr. C. Webster), excelled for twelve red Plums, and the EARL OF MAR AND KELLIE for two Melons (green or white and scarlet) and also for one Melon. R. W. E. COWPER, Esq., Gogar House, Edinburgh, was first for Gooseberries; the EARL OF HADDINGTON Mellerstain, for Black and Red Currants, Mr. P. LANDRETH for White Currants; Mr. J. RUSSELL, Newton Mearns, for Loganberries; Mr. J. W. MACDONALD, Wooden, Kelso, for Morello Cherries; and Admiral MAY, for Raspberries.

VEGETABLES.

Mr. JOHN GRAY, Uddingston, secured first honour for a collection of vegetables, consisting of twelve dishes, with very fine samples, for which he obtained 61½ points out of a possible 74; Mr. J. H. BELL, Bothwell, took second place with 55½ points out of a possible 74. For a display consisting of nine dishes, for which competitors in the previous class were not eligible to enter, Mr. C. F. D. GRAY, Uddingston, excelled with 47 points out of 61. Mr. D. A. HILL, St. Boswells, was second with 45 points out of a possible 60. Mr. J. GRAY also excelled for five tubers of Arran Comrade Potato, White Celery and Leeks. Mr. C. F. D. GRAY also excelled for six long Beet, and Mr. HILL for six Parsnips. A. CURRIE, Esq., Holylee, Walkerburn (gr. Mr. W. Redpath), excelled for eight varieties of Potatoes, also for four varieties, and for five tubers of The Bishop and Great Scot respectively. R. W. E. COWPER, Esq., Gogar House, Edinburgh, excelled for five tubers of Golden Wonder; J. J. BELL IRVING, Esq., Mackerston, Kelso (gr. R. Auldjo), for five tubers of Midlothian Early, twelve Onions and six Golden Ball Turnips; Mr. W. FORREST, Biggar, for five tubers of Kerr's Pink Potato, two pots of Parsley, four Cabbages and four Cabbage Lettuce.

The *Gardeners' Chronicle* Medal was awarded to Mr. J. GRAY, Uddingston, for his display of vegetables. (Class No. 187).

NON-COMPETITIVE EXHIBITS.

The following awards were made to Trade exhibits.—

Gold Medal.—To Messrs. DICKSONS AND CO., Edinburgh, for Roses; Messrs. AUSTIN AND M'ASLAN, Glasgow, for vegetables, etc.; Messrs. DOBBIE AND CO., Edinburgh, for Dahlias and Sweet Peas; Messrs. STORRIE AND STORRIE, Glencarse, for pot fruits, etc.; Messrs. THYNE AND SON, Dundee, for fruits, flowers, etc.; Messrs. JOHN FORBES (HAWICK), LTD., for Phloxes and other herbaceous plants; Messrs. C. ENGELMANN, LTD., Saffron Waldon, for Carnations; Messrs. ALLWOOD BROS., Haywards Heath, for hybrid Pinks and Carnations; Messrs. E. F. FAIRBAIRN AND SONS, Carlisle, for Phloxes; Messrs. I. HOUSE AND SON, Bristol, for Scabious and Kniphofia; and to Mr. R. LAWRIE, Carnwath, for Begonias.

Silver-gilt Medal.—To Messrs. BANNATYNE AND JACKSON, Hamilton, for Dahlias and herbaceous plants; Messrs. CUNNINGHAM, FRASER AND CO., Edinburgh, for shrubs; Mr. JOHN DOWNIE, Edinburgh, for herbaceous plants and fruit; Mr. W. FERGUSON, Dunfermline, for Roses; Messrs. LAIRD AND DICKSON, Edinburgh, for a miniature rockery; Mr. T. SMITH, Newry, for shrubs and herbaceous plants; Messrs. TILLIE, WHYTE AND BENVIE, Edinburgh, for a miniature garden, etc.; and to THE SCOTTISH CO-OPERATIVE WHOLESALE SOCIETY, West Kilbride, for Roses, etc.

Silver Medal.—To Mr. PETER AITKEN, Bathgate, for alpine and herbaceous plants; Messrs. DICKSONS AND CO., Edinburgh, for shrubs; Mr. A. FORREST, Kirknewton, for Pansies and Violas; Messrs. T. METHVEN AND SONS, Edinburgh, for a miniature garden, etc.; Mr. M. RAE, Biggar, for Begonias; Messrs. WHEATCROFT BROS., Nottingham, for Roses; and to Mrs. WATT, Edinburgh, for decorated tables.

Bronze Medal.—Dr. BADGER, Penicuik, for Schizanthus; Messrs. A. LISTER AND SON, Rothesay, for Dahlias, etc.; Messrs. JOHN WILSON, LTD., Hereford, for Onions; Mr. G. M'GLASHAN, Gosford, for Dahlias; Rt.

Reverend the Hon. B. J. PLUNKET, Clontarf, Dublin, for Lobelia cardinalis.

An Award of Merit was granted to Rose Princess Elizabeth, exhibited by Messrs. WHEATCROFT BROS., Gedling, Notts.

Cultural Certificates were awarded to The Rt. Rev. the Hon. B. J. PLUNKET for Lobelia cardinalis, and to Messrs. JOHN WILSON, LTD., Hereford, for Onions.

GUILDFORD AND DISTRICT ROSE.

FORMED only a few months ago, this Society has already a membership of 220 spread over a wide area. Under the guidance of its President, Mr. William Harvey, a well-known Rosarian, supported by an enthusiastic committee, the first show was held in the grounds of Weir House, Guildford, on Wednesday, September 14. Mr. Courtney Page, Hon. Secretary to the N.R.S., paid the new Society a signal compliment by breaking into his holiday in order to perform the opening ceremony. In declaring the show open, he spoke of his admiration for the magnificent collection of Roses that had been brought together. For a Society started only three months ago it was, he said, simply marvellous.

Altogether the entries numbered 191, and in all classes competition was keen. The prize for the best bloom was awarded to Mrs. ALEX. LEE for a specimen of Ruth, but this, curiously was but the second best for the best Rose was disqualified by late entry.

In the division open only to nurserymen, Messrs. D. PRIOR AND SON, Colchester, won the Society's Gold Medal for a superb collection. Mr. H. STREET, West Chobham, was awarded a Silver-gilt Medal, and Messrs. BIDE AND SON, Farnham, and Mr. J. H. PEMBERTON, Romford, Silver Medals.

The William Harvey Silver Challenge Cup, offered for the best display (not open to trade growers) was won by Mr. H. C. TURNER, Woking; Mr. F. C. STOOP, Byfleet, was second, and Col. YOUNGER, Guildford, third. The opening ceremony was preceded by a luncheon provided by the President at which Mr. Courtney Page was presented by Mrs. Harvey with a Certificate of Membership as the first Honorary Member.

GERMAN HORTICULTURAL.

THE exhibition held by the German Horticultural Society, from August 21 to 28, in the Clou Concert Hall, in Berlin, was a gratifying success. The show was opened by Oberbürgermeister Böss with an interesting speech.

The exhibits chiefly consisted of Roses and hardy flowers (August 20 to 24), and Dahlias (August 25 to 28). In the first part of the programme the firms of MATHIAS TANTAU and C. VOIGT, both of Uetersen, excelled, but the most notable exhibitor of all was Mr. VIKTOR TESCHENDORFF, of Dresden-Cossebaude, who showed beautiful groups of cut Roses, which included all the best and newest varieties. Among those showing hardy plants, the firms of CARL FÖRSTER, Bornim; ADOLF SCHMIDT, Berlin; and the GRÄFLICH SCHWERINSCHEN STAUDENKULTUREN were the most prominent.

Gladioli were well shown by the firm of PFITZER; a more prominent position might well have been given to this lovely exhibit, which kept fresh during the whole period of the show. The Dahlia Show brought some very fine groups, and the interest these aroused testified to the growing affection of the public for this flower. The three most outstanding firms in this section were REICHARDT, of Mariendorf; SEVERIN, of Kremen, and SCHWIGLEWSKI, of Karow; the GRÄFLICH SCHWERINSCHEN STAUDENKULTUREN also had a superb group, including not only the best of existing Dahlias, but also a number of new seedlings. Among the new plants shown was a variety of the Primula obconica section, from the firm of FASBENDER, with blooms of unusual size and remarkably strong growth; Mr. VIKTOR TESCHENDORFF showed his two new Polyantha Roses, Goldlachs and Locarno; and the firm of BREUER, Lichtenrade, showed a Chrysanthemum novelty named Frau Amalie Brandt.

ANSWERS TO CORRESPONDENTS.

ANTIRRHINUMS DISEASED.—K. M. R. The flower stems of the Antirrhinums are attacked in places by the fungus *Botrytis*, which, by girdling the stems, causes the tops to wither. If you intend to retain the plants the trouble would be reduced by the removal of affected stems.

BLACK AND YELLOW FLY.—W. P. The fly you send is a small female of the Giant Sawfly (*Sirex gigas*) commonly, and therefore, of course, erroneously, called the Giant Tailed Wasp or Wood Wasp. It is in no sense a wasp, and the long spike projecting from its hinder extremity is not a sting, but a sheath covering the saws with which it pierces holes in the wood of Pines and Firs in which to deposit its eggs. The whitish, maggot-like larvae devour the wood, in which they live for months. The male is coloured similarly to the female, but is without a spike. There are two other species whose life history is similar, viz., *S. juvenis* and *S. noetilis*, but the females of both these are steel-blue, though the males are similarly coloured to that of *S. gigas*. *S. juvenis* is very rare in Britain.

GRAPES FAILING TO COLOUR PROPERLY.—J. R. Your Black Hamburg Grapes appear to be suffering more from overcropping and a lack of potash in the soil than from any other cause. Apply two ounces of sulphate of potash to the square yard when top-dressing the border, and again when the bunches are swelling. Alicante is a more vigorous variety and will finish better under identical treatment than Black Hamburg. Give the latter more generous treatment, avoid overcropping, and the berries will be larger and the Grapes a better colour.

HORSE CHESTNUT TREE SHEDDING ITS LEAVES.—M. K. No fungus likely to be the cause of the leaf fall was found on the leaves sent. The trouble may be in the branches from which the leaves came, or it may even be due to some unsatisfactory conditions at the roots.

NAMES OF FRUIT.—J. R. G. 1, Warner's King; 2, Wyken Pippin; 3, Bramley's Seedling; 4, Roi d'Angleterre; 5, Mere de Menage; 6, Dumelow's Seedling (syn. Wellington); 7, Scarlet Nonpareil; 8, Lane's Prince Albert; 9, Tower of Glamis; 10, English Codlin; 11 and 12, Castle Major; 13, not fully grown, probably Northern Greening; 14, Blenheim Pippin; 15, Radford Beauty.

NAMES OF PLANTS.—F. P. 1, Spiraea Anthony Waterer; 3, Berberis vulgaris var.; 7, Potentilla fruticosa; 8, Ligustrum ovalifolium var. foliis aureis; 9, Genista aetnensis; 20, Spiraea canescens; 21, Berberis subcaulialata; 22, Calycanthus floridus; 25, Kerria japonica var. variegata.—J. 1 and 2, varieties of Cupressus Lawsoniana; 3, Abies Nordmanniana; 4, Picea orientalis; 5, missing; 6, Cupressus pisifera var. plumosa; 7, C. Lawsoniana var. filifera.—L. S. The Cupressus is Juniperus communis var. fastigiata; Escallonia Philippiana; Cotoneaster microphylla.

ROSE AND RASPBERRY.—Anxious. The small pieces of Rose and Raspberry sent afford no clue as to why the leaves are yellow. A dressing of farmyard manure might effect a change. We do not undertake to analyse soil for our readers; if you wish to ascertain its nature you should send a sample to the Advisory Chemist, University College of North Wales, Bangor, who would, no doubt, analyse it for you at a small fee.

REMARKS.—Business has again become more brisk in the pot plant department. Pot-grown Chrysanthemums have been in good demand, but at present the supplies are much below the requirements. Ericas are now in great demand and consignments of *E. nivalis* and *E. gracilis* in forty-eight-size pots are expected this week; these varieties are now obtainable in sixties and thumb pots. A few Solanums were on sale last week, these being the first arrivals this season. Foliage plants in various sizes are also in good demand. Chrysanthemums have now become the most prominent feature in the cut flower market; more varieties are offered amongst the disbudded blooms. White, bronze and yellow sorts are the best in bunch stuff and prices still remain firm for best quality blooms. Carnations are gradually becoming firmer in price, and so are Roses, the varieties Madame Butterfly, Golden Ophelia, Molly Crawford, Roselandia and Richmond, being very fine in quality. Carnations vary in price from 2/6 to 6/- per dozen blooms, and special kinds 7/- per dozen. Consignments of *Lilium longiflorum* are ample for present

requirements, but both white and pink varieties of *L. speciosum* are very limited in quantity. Amongst outdoor blooms Michaelmas Daisies, including Aster Amellus King George and a few Gladioli are the soundest in this class. White and coloured Asters and also single varieties are arriving in fairly large quantities, but the majority of these blooms have been damaged by the unfavourable weather conditions. Arums (Richardias) show a little improvement in quality, and more blooms have been offered during the past week. Single Violets have been arriving in better condition during the past few days, the cooler weather being more suitable for the transit of these blooms.

REMARKS.—Although business in the market is still somewhat restricted, and in some departments even worse than that, but there has been, in others, a slight improvement. In the English Apple market supplies continue heavy, but there is a little more activity in the demand for first grade dessert varieties, and culinary sorts also are sharing in the movement. Apples from North America are plentiful and cheap. A moderate sprinkling of English Pears is available, and best sorts are selling moderately well. Pears from California are comparatively cheap. Hothouse fruits, such as Grapes, Peaches, Nectarines and Melons are in ample supply for the available demand. Grapes from Guernsey being on the cheap side. English Plums are practically finished for the year; a few late ones are selling freely, and, on the whole, Plums have done very well throughout their season. English Tomatoes are a variable trade; the old crop is selling badly, but the few new crop Tomatoes arriving are selling at better prices. Jersey growers are sending fairly heavy supplies, and this trade would feel the benefit of warmer weather. Cucumbers are rather more plentiful, but the demand is slow. Forced Mushrooms are selling steadily at high prices for best produce. Very few field Mushrooms are yet on the market and those that are marketed sell well. The vegetable section is quiet except for a few good Peas and some forced Beans from Guernsey, which are in good demand. Onions from Holland, Egypt and Spain are a fair trade. The Potato trade shows little change and promises to remain steady.

GLASGOW.

THE tone of the cut flower market was firmer last week and a good business was transacted in Chrysanthemums at slightly dearer prices in most cases. Debutante realised from 1s. 6d. to 2s. for 6's; Pink Delight and No. 1 White, 1s. 4d. to 1s. 9d.; Phoebe, Harvester and Holicot Yellow, 1s. 3d. to 1s. 6d.; Amber Queen, 1s. to 1s. 3d.; Holicot Bronze, 1s. to 1s. 4d.; Alcalde, 2s. 6d. to 3s. for 12's; Phoenix, 2s. to 2s. 3d.; Cranford Yellow, 1s. 6d. to 2s. 6d.; Betty Spark, sprays, 10d. to 1s. per bunch; Phoenix, 9d. to 1s. and smaller stuff, 5d. to 8d. The value of other flowers showed little change either way. Carnations were worth from 2s. 6d. to 3s. per dozen; pink Roses, 3s. 6d. to 4s. per dozen; yellow Roses, 2s. to 3s.; red and white Roses, 1s. to 2s.; Liliums and Richardias made 2s. to 2s. 6d. per bunch; Calendula and Asters sold for 2d. to 4d. per bunch; Lily-of-the-Valley, 3s. to 3s. 6d.; Sweet Peas, 1d. to 3d.; Smilax, 1s. 6d. to 2s. and Asparagus foliage, 9d. to 1s.

In the fruit market Plums and Damsons, though plentiful, were slower to move. Scotch-grown Victoria Plums sold at 9d. to 1s. per lb.; Monarch and Prune Damsons, at 10s. to 12s. per sieve. Apples were dearer; Gravensteins realised 11s. to 14s. 6d. per case; York Imperial, 28s. to 39s. per barrel, and English cooking Apples (Lord Derby), 8s. per bushel; Block's Beurre Hardy Pears made 14s. 6d. per half-case. The prices of Sunkist Oranges were 28s. to 31s. per case; South African Oranges, 18s. Grape Fruits, 43s. to 45s.; and Pomegranates, 12s. 6d. Muscat Grapes fetched, 3s. 6d. to 4s. per lb.; Almeria Grapes, 15s. to 26s. per barrel; Bronze Melons, 8s. and Blackberries, 2s. 8d. per chip.

The business done in vegetables was quite featureless. Prices of Mushrooms advanced to 4s. 6d. per lb., but those of Tomatoes were easier at 6d. to 8d. per lb. Chilies were worth 11s. 6d. per crate of 18lbs.; Cauliflowers realised 4s. to 5s. per dozen; Cucumbers, 2s. to 5s. per dozen; Lettuces, 1s. 9d. to 2s. 3d. per dozen; while French Beans made 4d. to 5d. per lb.

GARDENING APPOINTMENTS.

Mr. A. Wardle, for the past nine years gardener to SIR RICHARD LEIGHTON, Bart., at Loton Park, Alberbury, near Shrewsbury, as gardener to RAOUH H. FOA, Esq., Holywell Park, Wrotham, Kent.

Mr. F. W. Thurgood, for many years gardener and Orchid grower to the late H. T. PITT, Esq., at Rosslyn, Stamford Hill, as Orchid grower to S. G. BROWN, Esq., Brownlands, Shepperton.

COLOURED SUPPLEMENT PLATE.

Laelio-Cattleya Oriflamme.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 50° 4°.

ACTUAL TEMPERATURE—
The Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, October 5, 10 a.m. Bar. 30.5°. Temp. 47°. Weather, Foggy.

A Summerless Summer. THE summer which has just departed—unwept, unhonoured and unsung—has taught the gardener many things. Chief of the lessons he has learned is that weather which depresses man brings vigour and floriferousness to all manner of plants. For surely, take it all in all, this sunless, sopping summer has never—at all events of recent years—been rivalled with respect to the brave show of garden flowers which, as though in defiance of rain and lowering skies, has graced gardens during the past six months. Weeds, no doubt, have thriven even more vigorously and, with the soil too wet for hoeing, have, in many gardens, piled up a heavy load of future troubles which will mature when the seeds begin to germinate. Fruits, too, have suffered, not perhaps, in profuseness, but certainly in flavour. Plums in some gardens are only just ripening, and those that the wasps have

spared have, or seem to us to have, a savourless, woolly taste. Wasps have abounded and nests have been hard to find. The best trap which we have seen consists of a rectangular garden light raised slightly above a metal tray, with a sugared shelf half way up. A trace of formalin added to the sugary bait gives a quick quietus, and in such a trap thousands of these marauders may be taken within a week. Of garden crops, Celery, which suffered so much last year, has flourished exceedingly, and September Peas have been plentiful. Potatoes, in spite of much leafy promise, are in many cases a poor crop and, need it be said, much infected with disease. More serious, perhaps, is the fact that where drainage is imperfect and soil on the heavy side, autumn digging may have to be delayed with serious effects on next year's crops. Good gardeners will not need to be told that with the persistent rains soils will already have lost a good share of their stores of nitrates, and that steps will have to be taken next spring to restore to the soil a sufficiency of that all important element, nitrogen. Yet, despite the deplorable weather with its attendant garden woes, borders at the present time are brilliant with the blue and rose and yellow of Asters, Heleniums and other autumnal plants. Berries, too, are beginning to light up the garden with their high tints—Sea Buckthorn, yellow-orange, varying in intensity of colour from plant to plant; Viburnum Henryi, rosy at present, turning to red hereafter; Viburnum rhytidophyllum—despised by some, but to our eye massive and magnificent—with great heads of ripening berries; and all the lovely tribe of Berberis with coral racemes. Strange, that in such a sunless year when Corn is still lying sodden in shock, that garden fruits should have been produced in such profusion. It would seem as though we are all inclined to infer from our own craving for sunshine that plants likewise need it, and in like intensity. This year would seem to prove the error of the inference. Diffuse and dull light with adequate temperature would seem to supply a fare of radiant energy sufficient for luxuriant and floriferous vegetation, albeit far short of the requirements of most of us. That it should be so, or even seem so, is a great solace and gives a pleasant recompense to the true gardener. He must, perforce, make many, albeit willing, sacrifices of his time. His seeing eye observes incessantly the mute but imperious claims which the garden makes on his energy. Though he gives willingly it is an added satisfaction to realise that when—as in this summer, he needed most brightness of colour to relieve gloom of sky and spirit—the garden has with unusual generosity requited him for his devotion. So in gratefulness and hope, the gardener will continue his avocation, confident that with the control of untoward circumstance which intensive cultivation means and gives, as he sows so he will reap, and be consoled to know that even this worst of summers cannot rob him altogether of the fruits of his labours.

Laelio-Cattleya Oriflamme.—The handsome Orchid that forms the subject of our Coloured Supplement Plate, was raised by Messrs. Armstrong and Brown by crossing Laelio-Cattleya Thyone with Cattleya Rex. The parents of L.-C. Thyone were Cattleya Dowiana aurea and L.-C. Ophir, while L.-C. Ophir was the result of crossing Cattleya Dowiana with Laelia xanthina. This history of descent indicates how L.-C. Oriflamme obtained the rich chrome-yellow colouring of its sepals and petals and the ruby colouring of its handsome labellum. The late Mr. Gurney Fowler used to grow L.-C. Oriflamme very finely.

Advertising Kew.—Notice boards have been affixed to the walls outside all the entrances to the Royal Botanic Gardens, Kew. These boards, painted a dark green and lettered in white, state the hours and charges of admission to the gardens, and there is a reversible panel which, on Tuesdays and Fridays, indicates that, on those days, the glasshouses and museums are also open from 10 a.m. to 11.45 a.m.

A Seed-drying Invention.—At the annual show of the High Wycombe and District Agricultural Association, which was held recently at Little Marlow, Bucks, the Marquis of Lincolnshire referred to an invention of considerable value to farmers in such a wet season as now experienced. When it was not possible to dry seed and corn crops out-of-doors they were brought into a barn and heaped around hot-water pipes, which, with the aid of an electric fan driving hot air through the seeds soon dried them. It was stated that, in this way, ten tons of Oats could be dried thoroughly in about eight hours. Lord Lincolnshire said that he believed the patent had been bought by the Government. It seems to us that, if further experiments support the initial experience, this idea should also be of great value to growers of garden seeds.

"Flowering Plants of South Africa."—No. 26 of Vol. VII of *The Flowering Plants of South Africa* contains illustrations and descriptions of ten plants, all of which belong to the great Mesembryanthemum family. These are Mesembryanthemum hamatum, which has a stout basal stem and descending branches, the latter bearing numerous bluish flowers; Haworthia tessellata, a low-growing, thick-leaved succulent plant, with long racemes of brown flowers; Mesembryanthemum stipulaceum, which was cultivated in England previous to 1732 and bears large, handsome, rose-purple flowers; Erepisia restiophilum, with elegant, purplish-pink flowers that remain open day and night (see *Gard. Chron.*, Vol. 78, p. 433); Crocanthus Thunbergii, a freely-branching plant, with clear yellow petals; Leipoldtia constricta, a small-leaved species, with rose-pink flowers; Cephalophyllum acutum (see *Gard. Chron.*, Vol. 78, p. 433), with thick, semi-terete leaves and large, solitary, deep rose-purple (almost crimson) flowers; Aridaria dela (see *Gard. Chron.*, Vol. 78, p. 433), one of the smaller species, with short leaves and rose-purple petals; Schonlandia Lehmannii, in which the large flowers have numerous pale lemon-yellow petals; and Leipoldtia plana, a pretty plant with decumbent branches, short fleshy leaves and bright rose flowers that open at mid-day.

Southend Gardeners' Outing.—Nearly one hundred members of the Southend Parks' Staff visited Cobham and Canterbury on the occasion of the annual outing. The Parks' Superintendent, Mr. Arthur Keeling, made all the necessary arrangements for the trip, including lunch at Canterbury, tea at Sittingbourne, and a smoking concert at Pitsea in the evening. At the conclusion of the lunch, the employees presented Mr. Keeling with a suit case, and Mrs. Keeling with a hand bag, as tokens of regard. Mr. Keeling is as popular with his staff as he is successful in the management of the parks and open spaces of Southend.

Lead in Garden Decoration.—The fact that lead is now coming into use again as a metal for garden ornaments, lamps, terrace boxes, etc., after a period of comparative disuse, is commented upon in an article in *The Builder* for September 30. Lead was extensively used for decorative purposes in the past; it has artistic possibilities as great as those of any other metal, with the added advantage that it is almost indestructible and does not require painting; in fact, its appearance improves with age. Again, in case of accidental breakage, not only can necessary repairs be easily and quickly carried out, but the repaired portions can be made as good and as sound as before the injury. No other metal lends itself so easily to artistic treatment; it may be cast to any desired pattern, it may also be worked by tools to the various shapes required, and ornamental features and details can be worked upon it in much the

same manner as repoussé work is carried out in the case of harder metals, with greater effect. Architects of former times were fully aware that lead lent itself to decorative treatment, and a number of ornamental leaden rain-water heads and pipes are still to be seen, in an excellent state of preservation, on many famous buildings, such as those at Hampton Court (dated 1528) and St. John's College, Cambridge (dated 1599). The modern lead-worker avoids the use of solder, which sometimes shows at the joints, by the method known as lead-burning, which, by fusing the metal itself for joining, renders the joint almost invisible. Leaden garden statuary possesses many advantages over stone, and even over bronze, and we are likely in the near future to see a considerable advance in the use of this metal for the purpose.

London Gardens Guild Lectures.—The following series of horticultural lectures, arranged by the London Gardens Guild, will be given in Prince Henry's Room, Fleet Street, E.C.4, commencing at 8 p.m., on each date:—October 13: Mrs. Ada Slater, L.C.C., Ex-Mayor of Bermondsey, on "The Beautification of London"; October 27: Mr. Alfred Dawkins, on "Bulb Cultivation"; November 10: Mr. W. Williams, Superintendent of Avery Hill (L.C.C.) Botanic Gardens, on "School Gardens"; November 24: Miss Kate Barratt, Principal of the Swanley Horticultural College, on "Gardening as a Career for Women"; December 8: Mr. Hugh Main, B.Sc., on "Insect Friends and Foes of the Gardener"; January 5, 1928: Mr. Archibald P. Balfour on "The Raising of New Varieties of Flowers"; January 19: Mr. Arthur Osborn, Assistant Curator, Royal Botanic Gardens, Kew, on "Shrubs for Town Gardens"; February 2: Mr. W. L. Lavender, on "Annuals for Cutting"; February 16: Mr. H. J. Jones, on "Chrysanthemums"; March 1: Mr. G. C. Taylor, B.Sc., Editor *The Garden*, on "New Plants"; March 15: Mr. J. D. Stewart, Librarian, Bermondsey Public Libraries, on "Gardens in Literature"; and March 29: Mr. W. L. Lavender on "Annuals for Garden Decoration." Non-members of the Guild may obtain admission tickets, 1s. per lecture, from the Secretary, Mr. R. Sudell, 124, Walworth Road, S.E.17.

Jubilee Exhibition at Leyden.—As mentioned in our issue of August 20 (p. 141) the Leyden branch of the Dutch Royal Horticultural Society is this year celebrating its fiftieth year of existence, and an important exhibition and other festivities were arranged to celebrate the anniversary. On September 13 the festival was officially opened in the reception room of the Town Hall, with a speech by Heer E. Th. Witte, the President of the Branch; there were also present the Burgomaster of Leyden, the General President of the Society, and many other distinguished persons. The exhibition occupied the large downstairs hall and also the gallery, and represented the finest products of the principal local growers and florists. Besides the exhibition, there was an official dinner at 6 o'clock on the evening of the opening day, followed by a musical entertainment and a display of classical dancing. The next morning a large meeting of members and friends took place, and the Burgomaster officially welcomed them to the Town Hall. The floral opera, "Bloemensproke" was a great success.

Horticultural Education Association.—The annual meeting and conference of this Association took place recently at the Swanley Horticultural College, at the kind invitation of the Principal, Dr. Kate Barratt, and there was a large attendance of members present. The latter were thoroughly interested in what they saw at Swanley, and visits were also paid to the Research Station at East Malling, where the various trials and experiments were explained by Mr. Grubb, in the unavoidable absence of Mr. Hatton. The opportunity of seeing Apple trees in a state of bearing that were worked on the selected stocks which have made East Malling famous was much appreciated. Another visit of an equally educational character was paid to the Fruit Packing and Canning Station at East Farleigh, at the kind invitation of Mr. Gregson, who explained the methods adopted at the station for the collecting, grading, packing

and selling of growers' Apples. The social feature of the Conference was the Annual Dinner which was attended by Sir William Lobjoit, J.P., and Mr. Garrad, Agricultural Organiser under the Kent County Council. Not the least interesting and useful item in the proceedings was the conference at which Sir William Lobjoit presided, and papers on educational topics associated with horticulture were contributed by Dr. Kate Barratt and Mr. J. G. Murray. Amongst the members who took part in the discussion was Mr. F. J. Chittenden. Sir William Lobjoit was thanked for all he has done to further the interests of horticultural education and congratulated on the honour recently conferred upon him. It was generally agreed that the Conference was one of the most interesting and valuable held under the auspices of the Association.

Mr. J. May.—One of the old school of gardeners, Mr. J. May has now retired from active service, and is living with his son, who is gardener at Childwick Bury, St. Albans. So far back as 1861, Mr. J. May served under Mr. George Austen at Porthgwen, Cornwall, and left those gardens to serve at Mereworth

MR. J. MAY.

Castle, where he remained for seven years, before going to Messrs. James Veitch and Sons' nurseries. From Chelsea, where he worked in several different departments, he took up the position of foreman at Givon's Grove, Leatherhead. His next appointment was as foreman and decorator at Normanhurst Court, and one of his pleasantest recollections is that of decorating Lord Brassey's yacht, the *Sunbeam*, which was then becoming famous. Mr. May also used Marguerites for decorating the town house in London, and was probably the first to use these plants for this purpose. He left Normanhurst Court to become gardener at Northaw House, Potters Bar, where he served three employers, and his total period of service there amounted to thirty-six years. In the early part of his career at Northaw House, Mr. May became a very successful exhibitor, especially of vegetables, which he showed at the old South Kensington exhibitions and also at the Royal Aquarium, Westminster. Syon House Potato was a great favourite with him, and on one occasion when he exhibited this variety before the Royal Horticultural Society he was awarded a Silver Medal and First-Class Certificate. Northaw Prize Brussels Sprout and Chrysanthemum William Robinson were both introduced by Mr. May, whose name will be quite familiar to many of our older readers. Although eighty years of age, Mr. May still takes an active interest in all gardening matters and never misses reading *The Gardeners' Chronicle*. In

August last—as notified in these pages—this grand old gardener and his wife celebrated their Golden Wedding.

Reversion in Black Currants.—Careful readers of *The Gardeners' Chronicle* have learned long since how to distinguish evidences of reversion in Black Currants—the general principle being the reduction of veins and teeth in the terminal lobe of a leaf, as compared with those of a normal leaf. Probably the first use of the term "reversion" was used in these pages during 1912, when "Southern Grower" and Mr. E. A. Bunyard drew attention to this trouble. In the current issue of the *Journal of Pomology and Horticultural Science*, Mr. J. Amos and Mr. R. G. Hatton, of East Malling, give a very comprehensive review of this disorder under the title of "Reversion in Black Currants," where they deal at considerable length with the symptoms and diagnosis of the disease, and illustrate the text with numerous reproductions from photographs. In the same issue Mr. T. Wallace discusses "Field Experiments on the Manuring of Gooseberry Bushes," and Mr. E. Ball contributes an interesting and helpful article on "The Time of Differentiation and the Subsequent Development of the Blossom Bud of the Plum"; he points out that "If it be known when the primordia of the flowers are laid down he (the practical horticulturist) may be able to intervene at the right time in order to influence the blossom bud production by pruning or manuring." The concluding article is a lengthy one by Mr. Richard le Pelley entitled "Studies on the Resistance of Apple to the Woolly Aphis."

Distribution of Surplus Bedding Plants in the London Parks.—The surplus bedding plants at the London County Council parks and gardens will be distributed to the public between the hours of 9 a.m. and 11 a.m., on Saturday, October 15. Persons desiring to participate in the distribution should make personal application to the officers-in-charge at the various parks or gardens. Plants will not be handed to children under the age of fourteen unless they present a note from their parents or teachers.

Medal for Royal Park Foreman.—His Majesty the King has been graciously pleased to confer upon Mr. John Linford, foreman at Greenwich Park, the Royal Victorian Medal (Silver) in recognition of his long service and good record in the Royal Parks. Mr. Linford joined the staff of Hyde Park in 1880 and was promoted to his present post in 1903. During his service of close on half-a-century, Mr. Linford has seen many changes in the Royal Parks, and has had varied and interesting experiences, and he is held in high esteem by all who know him. Sir Lionel Earle, Permanent Secretary of H.M. Office of Works, in presenting the Medal to Mr. Linford, congratulated him on his forty-seven years of good service and on the honour conferred upon him.

Mr. George F. Tinley.—After a long connection with *The Gardeners' Chronicle*, whereon, latterly, he held the position of Associate Editor, Mr. George F. Tinley has taken up the duties of Technical Editor of the *Fruit, Flower and Vegetable Trades Journal*. Mr. Tinley carries with him the good wishes of the Directors and Staff of *The Gardeners' Chronicle*.

Early Autumn Shows in Holland.—A successful horticultural exhibition was held recently at Doorn, in Holland. Three large tents were erected and one of these was warmed for the accommodation of tender plants, of which a good selection was sent. A "procession of flowers" was an added attraction on the third day of the show, on which day also the ex-Kaiser of Germany paid the exhibition a visit; he presented some handsome prizes for competition. On September 20 the Dutch Rose Society held its forty-seventh members' meeting in Amsterdam, Jhr. J. L. Mock in the chair. The Secretary, Heer E. J. Ludding, gave some encouraging figures in regard to membership, etc., of the Society, and of the success which had attended the exhibitions held during the year. The possibility was discussed of arranging a large Rose Show to take place in the Zoological Gardens at the Hague in July 1928, on the

occasion of the Olympiad. An interesting exhibition of garden craft was held at the Hague recently, opened by Burgomaster W. W. van der Meulen, and arranged under the joint auspices of the local Art Circle and the Union of Dutch Landscape gardeners. As an instance of the fame Dutch gardeners enjoy outside their own country, one of the exhibits was a plan of a villa and garden, designed by Heer Brandes, in the Italian vine-growing district.

New Irish Free State Patents and Trade Marks Act.—Our contributors, Messrs. Rayner and Co., draw attention to the new situation which is created by the coming into force of the new Patents and Trade Marks Act in the Irish Free State on October 1, 1927. Previously, British Patents and Trade Marks have covered the whole of Ireland, but with the new Act in force they will automatically cease to function in the Irish Free State. It is, therefore, necessary, for all holders of British Patents and Trade Marks desiring to retain their protection in Southern Ireland, to "validate" their Patents and Trade Marks there. British Patents and Trade Marks will therefore be continued upon

football grounds, £10,000; cricket ground, £3,000; twelve tennis courts, £1,800; two bowling greens, £2,000; and two pavilions, £2,000. Planting, water supply, and other requirements were estimated at £500, the complete estimate being £20,205. The Council has agreed to the immediate construction of the drive, four football pitches, a cricket ground and one pavilion.

Linnean Society's Meetings.—The general meetings of the Linnean Society of London for the 1927-1928 session will be held at Burlington House, Piccadilly, on November 3 and 17; December 1 and 15, 1927; January 5 and 19; February 2 and 16; March 1, 15 and 29; April 19 and May 3 and 24, 1928. The anniversary meeting is fixed for May 24. All the meetings commence at 5 p.m.

Covent Garden.—At the annual meeting of the Beecham Estates and Pills, Ltd., Sir Arthur Du Cros stated that in view of the great opposition raised the Directors had no alternative but to withdraw the Bill for the removal of Covent Garden Market to the Foundling Hospital

ical way of heating a greenhouse twelve feet by nine? An idea struck me, that if a small gas pipe could be brought underground from the house to the greenhouse, and then carried through the latter by piping, it would answer. This has been effected in the following cheap and easy manner. A wrought-iron box was made two feet square, with a door in it for opening to light the gas, as well as to give it air to burn with. This box was fixed in the brickwork, near the back of the east end of the house; from this a three-inch pipe fixed near the top of the iron box, was led to the other end of the house, from which, after rising six inches higher, it was conducted back again and passed through the end of the house into the open air, where, forming a bend, it ran up the outside in the shape of a chimney, with a little cap on the top to keep out the rain. The gentleman has had this contrivance lighted several times to show it to his friends, who are all so satisfied with it that they mean to have one put up for themselves; the burner is a fish-tail, which can be regulated so as to furnish much heat, or little. No lighting till required is needed; no burning and over-heating over night; and as to economy,

FIG. 126.—ODONTOGLOSSUM TOREADOR VAR. NUANCE.

R.H.S. Award of Merit, September 28. Flowers white, rose and brown. Shown by Messrs. Charlesworth and Co. (see p. 272, where the varietal name was omitted).

the Irish Register if a certificate of the Patent or Trade Mark is lodged in the Free State and renewal fees paid as in England, together with other conditions which are required. Should any of our readers desire more detailed information on this important subject, Messrs. Rayner and Co., 5, Chancery Lane, W.C.2, will be glad to supply it free of charge.

Paeonies for Canadian Towns.—The daily papers announce that H.R.H. the Prince of Wales has instructed the Bank of Montreal to distribute Paeonies to the "cities, towns and villages of Canada as a memento of his visit." We imagine there is a mistake somewhere because of the enormous number of plants that would be required to provide even one only for each place within that vast Dominion.

New Sports Ground for Brighton.—The Brighton Town Council has under consideration a big scheme for providing a new sports ground at Coombe Farm, North Moulsecombe. The scheme, as presented by the Parks Superintendent, Mr. B. H. MacLaren, provides for a drive of one-and-a-quarter mile, to cost £905; four

site, they proposed therefore to modernise and extend the existing Market.

Appointments for the Ensuing Week.—**MONDAY, OCTOBER 10:** Harrogate and District Horticultural Association's Meeting; National Chrysanthemum Society's Floral Committee meets; United Horticultural Benefit and Provident Society's meeting; Guildford and District Gardeners' Association's meeting. **TUESDAY, OCTOBER 11:** Royal Horticultural Society's Fruit Show; Jersey Gardeners' Society's meeting. **WEDNESDAY, OCTOBER 12:** Sheffield Chrysanthemum Society's meeting; Wimbledon Gardeners' Society's meeting. **FRIDAY, OCTOBER 14:** Royal Horticultural Society of Ireland meeting. **SATURDAY, OCTOBER 15:** British Mycological Society's Foray with Essex Field Club at Epping Forest; Carnwath Chrysanthemum Society's show.

"Gardeners' Chronicle" Seventy-five Years Ago.—*Heating Greenhouses with Gas.*—About two months ago, a gentleman in my neighbourhood asked me what was the most econom-

when full on, it burns six feet of gas per hour. Instead of wrought-iron pipes, however, they should have been cast-iron, with saddles on them to hold water, but even in the present case a zinc saddle might be made to answer. I had the gas lighted when I went to inspect it, and in five minutes the pipe was hot at the other end of the house. This simple apparatus will not rest here; if gas can be applied upon a small scale it can upon a large one, and no doubt in time forcing houses will be warmed by it as well as Melon and Cucumber pits, large greenhouses, conservatories, and houses of all sorts. But I hear some one say, country places cannot have it; cannot gentlemen put up gas apparatuses? Only one fire would then be wanted to do the duty of the whole establishment. *James Cuthill, Camberwell.* [The difficulty with gas has always been that it burns the air, and also contaminates it by escape. It is indispensable that both these sources of evil should be most effectually guarded against—not a very easy thing to do, as is shown by the number of similar attempts which have ended in failure].

Gard. Chron., October 9, 1852.

The Week's Work.

THE ORCHID HOUSES.

By J. T. BARKER, Dunstable, Bedfordshire.

Calanthes.—The new pseudo-bulbs of the deciduous *Calanthes* are well advanced, and in order to obtain strong spikes and to secure clear, bright-coloured flowers, the plants should be afforded plenty of room, so that each individual may receive its due share of light. To this end it is advisable to grow them close to the roof-glass and to shade them no more than is absolutely necessary to prevent the sun's rays damaging the foliage or pseudo-bulbs. After the sunless summer, the grower should endeavour to get the growth of the plants consolidated so much as possible to prepare them for the coming winter. During the middle hours of the day, when the sun is bright, only a very thin shade is needed, but if exposed to the sunshine early in the morning and again in the afternoon, when there is no danger from scorching, the pseudo-bulbs will finish and ripen thoroughly. In the extra light and heat the plants will dry more quickly and will require plenty of water at the roots; liquid manure given alternately with clear water will be beneficial. Plants of the *C. Regnierii* section that produce their flowers in the spring are only about half way through their growing season and their development should be hastened so much as possible. Plants of the evergreen section, which include *C. veratrifolia*, *C. Masuca*, the hybrid *C. Dominii* and others, are also making their growths, and should be plentifully supplied with water. These plants may occasionally be seen growing vigorously in the ordinary plant stove-house, with other exotics. Plenty of light is good for them, but strong, direct sunshine will injure the foliage and check growth.

Seasonable Remarks.—The majority of Orchids are completing their season's development, and with so little sun the growth is of a soft, sappy nature, therefore every endeavour should be made to mature the growth before the winter sets in. Should the weather continue damp and unsettled, the management of Orchids should be modified as regards atmospheric moisture, it being a mistake to keep the air in any of the houses over-charged with moisture during such weather as we have recently experienced. More especially does this apply to inmates of the *Cattleya*, intermediate and cool houses. As regards the warmer houses, a certain amount of atmospheric moisture must be maintained to counteract the drying effects of artificial warmth and to prevent the spread of insect pests. Differences of locality and in the positions and structure of the houses must be taken into consideration, as these affect their capacity for holding atmospheric moisture. Everything depends on maintaining a proper balance of heat, light and air in the different departments. Even in the warmest division, atmospheric moisture can be overdone, especially during damp, cold weather, as an excess of moisture in any house has a tendency to lower the temperature considerably and make most unsuitable quarters for Orchids to thrive in.

Syringing and Spraying.—It is not good practice to continue syringing or spraying each time the air in the houses gets in the least dry, especially at this season, when numbers of the plants are finishing their growths and preparing for rest. To enable the new growths of those plants still active to finish and the new pseudo-bulbs to mature, each division should be allowed to become comparatively dry for a few hours during the middle of each day. At this season it is essential that plenty of light should reach such plants as *Thunias*, *Cattleyas*, *Laelias*, *Vandas*, *Catasetums*, *Cycnoches*, *Mormodes*, *Dendrobium* and other sun-loving plants, so that they may become well ripened and produce a full crop of flowers.

THE KITCHEN GARDEN.

By R. H. CROCKFORD, Gardener to THE RT. HON. LORD WAVERTREE, Horsley Hall, Gresford, N. Wales.

Mushrooms.—Continue to collect fresh manure from the stables daily and spread it thinly in a dry, open shed until sufficient has been obtained, after which the whole should be thrown together in a heap, and turned about every third day until it is in a suitable condition for use, when the beds should be formed. The manure should be made very firm in the beds. The Mushroom house should be made scrupulously clean and the walls and ceilings white-washed to destroy any insects that may be present. The beds need be only about fifteen inches in depth or even less will suffice if they are well made. Place a thermometer in the manure, and so soon as the heat declines to about 80° the bed should be spawned. The spawn should be obtained from a reliable source, broken into pieces about the size of a small pullet's egg and inserted about one-and-a-half inch under the manure and about six inches apart. Afterwards the whole of the bed should be covered with about two inches of good, loamy soil and beaten very firmly. A layer of clean straw should then be spread over the bed. Mushrooms should appear in about six weeks from spawning. Do not use fire-heat for the present, as Mushrooms grow best without artificial heat, so long as the temperature remains at about 55°.

Brussels Sprouts.—This winter vegetable has grown very strongly this season owing to the abnormal amount of wet weather. Where the soil was enriched with much manure, growth is far too sappy and coarse. I advise that all yellow leaves be removed and a few others where growth is crowded, in order to allow as much air and light as possible to reach the young sprouts. I previously advised that the soil be made very firm before planting this vegetable. Where this was done and plenty of space allowed between each plant the results are satisfactory. Coarse, loose sprouts should be gathered for present use; this will prevent the firm buttons which are left from being overgrown by the others. If not already done, very strong plants should be loosely tied to stakes before the autumn gales break them down.

Cauliflowers and Autumn Broccoli.—A careful watch should be kept on these crops and the curds protected by drawing or tying the leaves carefully over them to protect the heads from frost. At the same time remove all caterpillars, which do irreparable damage to the plants.

Other Brassicas.—During fine weather, the various winter greens should be examined and all decayed leaves and weeds removed. The Dutch hoe should then be used between the rows wherever it is possible to do so.

FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P., Ford Manor, Lingfield, Surrey.

The Orchard House.—With the exception of a few late Plums and Pears, most of the trees in this house are cleared of their crops, and although the season has not been favourable for ripening the wood, they should be fit for removal to the open. For some months to come they may receive full benefit of rain, frost and plenty of water. All orchard house trees which have ripened their wood under glass will withstand any reasonable amount of frost, provided they remain dormant. Means should be taken to protect them from birds and keep worms out of the pots. When placed in position, the spaces between the pots should be packed with Bracken or litter to prevent frost from cracking the pots. Provided the soil is thoroughly moist, the trees will take little harm through the winter.

Potting.—The old balls of earth about the roots of late trees may be reduced and the trees repotted in fresh compost. Considering that these

trees will not be forced, and roots being plentiful, they will fruit well after severe handling. Young trees that were root-lifted last autumn, pinched and specially prepared for potting, may now be placed in receptacles varying from eight inches to ten inches in diameter. All stone fruits, Pears and Apples, should be grown in fairly heavy calcareous loam mixed with burnt earth, old lime rubble, crushed bones and soot, in preference to animal manure. The soil, provided it is in a fairly dry condition, should be made very firm in the pots by ramming. As the sap has scarcely ceased circulating, the roots should receive one good watering prior to plunging the trees in the open.

The Grape Room.—The annual cleansing of the Grape room should be done at once. Valuable use may be made of this room to ripen choice, early Pears, as the Apple room is generally too cold and possibly too damp to bring out the full flavour of these fruits.

PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NALL-CAIN, Brocket Hall, Hertfordshire.

Bulbs.—Continue to pot bulbs as they come to hand. Early Tulips may be grown in much smaller receptacles than those of the Darwin type, which require to be grown in seven-inch pots. Where quantities of cut flowers are in demand, bulbs are best grown in boxes, but care should be exercised against crowding them. Darwin Tulips will not submit to the same amount of forcing as other Tulips, but they may be grown successfully under glass when they are allowed to develop slowly. In my opinion, the Darwin Tulip is one of the most useful plants for supplying blooms in the early spring, and varieties of many shades of colour are available.

Cyclamens.—Where a large quantity of greenhouse Cyclamens are cultivated, some of the earlier plants may be placed in a lean-to house for preference, near the roof-glass. A minimum temperature of 50° should be maintained. Plants that are sending up their flower stems require very careful watering, and at no time must moisture be allowed to lodge among the leaves, otherwise the flower stalks will damp off. If the receptacles are well-filled with roots, the plants will be benefited by a small amount of concentrated fertiliser, care being taken when applying it that it does not come in contact with the centre of the corms. Freedom from insect pests is essential, and if any are present fumigate the plants on two or three occasions. This should free them from aphids and check the spread of mites.

Primula sinensis.—Where these plants have been grown in cold frames during the latter months they may be transferred to an airy house where a minimum temperature of 50° is maintained. Primulas, when approaching their flowering stage, resent a cold, damp atmosphere, therefore it is advisable to allow a little gentle heat to circulate through the water-pipes and admit air on all possible occasions. Do not crowd the plants, and when the receptacles are well-filled with roots they should be fed with liquid manure obtained from the cowsheds, alternated with weak soot-water. *Primula malacoides* should, for the present, receive as cool treatment as possible.

Gloxinias.—Continue to dry off these plants gradually; so soon as the foliage is ripe, the receptacles may be laid on their sides in a moderately warm place. Perhaps the most suitable temperature in which to winter the tubers is from 50° to 55°; if placed in a higher temperature growth will develop during the winter, while, on the other hand, a lower temperature would cause the tubers to rot. Young Gloxinias are hardly past their flowering; these will need very careful ripening, otherwise a good percentage of the little tubers will be lost during the winter; in fact, it is not wise to dry them off so drastically as the older plants, for this reason.

HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD, Wrotham Park, Barnet, Middlesex.

Propagation of Bush Fruits.—In gardens where bush fruits are in demand, a certain number of bushes should be propagated annually. Cuttings of Gooseberries and Currants may be made and inserted at this season of the year with very satisfactory results. Some gardeners select suitable shoots for propagation, tie them in bundles of about thirty in each, and heel them in until bad weather affords an opportunity for preparing them. Choose sturdy, well-ripened shoots, about fifteen inches long and take out the lower buds, except in the case of Black Currants. Cut the shoots just below a bud, if the cuttings are not furnished with a heel of old wood. Plant them firmly six inches asunder in rows made one foot apart.

Young Bushes.—Where it is decided to grub up old plantations and plant new, remove the old bushes and make preparations for replanting. The soil should be in good heart and tilled deeply. If the bushes are to be grown on the old site, trench the soil thoroughly and incorporate plenty of well-decayed manure, lime and other suitable materials with it. Plant half way between where the old bushes grew. Young, strong, healthy bushes should be planted quite six feet apart; if given good attention they will soon develop fine, fruitful heads, and bear heavy crops for many years. I have, at this season of the year, shifted quite large bushes of both Gooseberries and Currants, and all did remarkably well the following season.

Root-pruning.—A note should be made of all trees that require to be root-pruned. Soil consisting of rich loam with plenty of fibre and in a somewhat rough state should be mixed with a fair quantity of bone-meal, old mortar and charred earth. If the loam is of poor quality, add well-decayed manure to enrich it.

THE FLOWER GARDEN.

By JOHN COUTTS, Assistant Curator, Royal Botanic Gardens, Kew.

Preparations for Spring Bedding.—Towards the middle of the present month, even if frost does not intervene, many summer subjects may be cleared from the beds and borders to make room for bulbs and other subjects for a spring display. It is very important to get this work done so soon as possible so that Wallflowers and other plants of this description may be well-established before winter. Bulbous subjects should be planted so soon as possible, for however well they may be stored, they do not improve by being kept out of the ground longer than necessary. Bulbs may be used either alone or associated with other spring-flowering subjects, such as Wallflowers, Aubrietias, Myosotis, Iberis and Daisies, the dwarf-growing plants being used for carpeting the surface of the beds. Where varieties of Narcissus are used for bedding purposes, they should be the first to receive attention, as they suffer more than the general run of bulbous plants by being kept out of the ground for any considerable length of time. Hyacinths are not so largely used for bedding as they were at one time, because of their stiff, formal habit; they have their value, however, and look best when not too closely planted, filling between them with some dwarf, carpeting plant. The early-flowering "Dutch" Tulips are best used either in beds of one variety or two sorts of contrasting or harmonising colours. This class of Tulip blooms early, which is a great advantage, for they permit the planting of summer bedding plants in good time. The taller-growing Darwin and Cottage Tulips may be mixed with dwarf-growing plants, such as Violas and Myosotis, and the tallest varieties with Wallflowers. Breeder Tulips flower at the same time as these last and they deserve to be more largely grown. When preparing beds for bulbs, the soil should be dusted with lime or basic slag; it is not advisable to add animal manure, but if it is considered necessary to do so, it should be well-decayed, and care should be taken to dig it well in so that it does not come in contact with the bulbs.

FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF AILSA, Culzean Castle, Maybole, Ayrshire.

Old Fruit Trees.—The removal of old fruit trees which have served their day is often a difficult matter, but where these have deteriorated beyond hope of recovery they should be marked for removal at an early date, and even younger trees which have consistently refused to respond to all methods to make them fruit, should also be removed and their places filled by younger trees. In large establishments it is a usual custom to order a number of young fruit trees in advance of actual requirements, and when these

Root-pruning.—This operation is rendered necessary when too much growth is being made and it becomes apparent that the energy of the plant is being wasted on the production of wood instead of fruit. By reducing the root-system the balance is restored, which may have been upset by a variety of causes, such as a wrong style or method of pruning, or too much humus in the soil. The method of root-pruning has been so often described in these pages that I need only emphasise the necessity of allowing the operator plenty of room, so that he may be able to sever any roots which are growing down in the sub-soil. When filling in

FIG. 127.—APHELANDRA SQUARROSA VAR. LEOPOLDII.
R.H.S. Award of Merit, September 28. Leaves green, cream-veined; bracts pale yellow. Shown by Messrs. L. R. Russell, Ltd. (see p. 272).

are given temporary quarters and attention in pruning and training, they form very much better plants for filling vacancies than those just bought in from the nursery; moreover, as they are growing on the premises, they can be shifted to their new quarters with reasonably large balls of soil and roots. In replanting on a site occupied by old trees for fifty years or more, the border should be renewed. Remove most of the old, exhausted soil to the vegetable garden and substitute a good compost of loam, wood-ash and lime-rubble to a width of three or four feet, after ascertaining that the drainage is in good order. The addition of manures, either farmyard or artificial, is not necessary in the case of young trees, as these are inclined to grow vigorously if fed liberally, at the expense of cropping. The aim of the grower should be to secure short-jointed growths of moderate length in preference to long, sappy ones.

the soil, make it quite firm by ramming, and finish off with a top-dressing of fresh compost to encourage the formation of surface-feeding roots. If root-pruning is done in October, the trees have time to recover from the check before winter, and it is best performed before the foliage has dropped.

Brussels Sprouts.—This valuable winter crop is coming into use, and where the plants were intercropped with earlier-maturing vegetables, the remains of these should be removed, also some of the lower leaves of the Brussels Sprouts, thus allowing plenty of air to circulate among the plants, and also to permit of the Sprouts being picked during wet weather in greater comfort. In gathering the Sprouts, select first those at the bottom of the clusters, which are more or less well advanced and of uniform size.

ORCHID NOTES AND CLEANINGS.

CATTLEYA LABIATA.

CATTLEYAS have a horticultural importance that is scarcely equalled by any other member of the Orchid family. This pre-eminence is due to the great beauty of their flowers, which are not only of large size, but also exhibit a wonderful variety of colours, from purest white to that of the richest Orchid mauve, whilst the colouring is often enhanced by the most beautiful pencillings and markings in the lip, which is an especially striking feature of the flower. The interest attaching to Cattleyas has been further enhanced by the results of hybridisation, not only by the crossing of one species with another, but also by the crossing of Cattleyas with species of *Laelia* and other genera. Many new shades of colour have been developed in the progeny, and the various crossings and inter-crossings have also brought into existence new forms which are easily grown and bear flowers of better shape, which adapt themselves to every form of floral decoration and lasting fresh longer than those of the typical species.

When growing on the trunks of trees in their native habitat, the masses of *Cattleya labiata* increase in size in one direction only, which is always the ascending one; even under cultivation the tendency to increase in size in one direction more than another is observable and very defined. The genus *Cattleya* was founded by Dr. Lindley on *C. labiata*, and dedicated to Mr. William Cattley, of Barnet, a liberal patron of horticulture in his time.

Cattleya labiata is the collective name for a group of Cattleyas, remarkable for the large size and extraordinary beauty of their flowers, some one or the other being in bloom through the greater part of the year. The group includes a number of distinct forms, known in cultivation under various names, which pass as specific, but in their vegetative organs, too—rhizome, stems and leaves—they present a uniformity that renders it most difficult to distinguish them one from the other when out of flower.

The typical *C. labiata*, which at one time was called *C. labiata vera* to distinguish it from the varieties, was an extremely rare plant, and was only represented in a few collections, but on its re-discovery it was imported in such quantities that it was to be found in every garden where there was any pretension of growing Orchids.

The normal flowering season of *C. labiata vera*, or, as it is now known, the autumn-flowering *C. labiata*, is October and November, two of the duller months of the year, when its flowers are especially appreciated by those who have to provide Orchid flowers in large quantities for shooting parties and other functions. At the present time there is a great demand for the original species, while the rarer forms of *C. labiata* are much sought after, and have realised remarkable prices.

C. labiata was introduced in 1818 by Mr. William Swainson, from the Organ Mountains, where it was almost exterminated many years ago; it is still imported in limited quantities into this country by different firms, which is proof that there are still some plants in existence in its native habitat. *C. labiata* succeeds under the orthodox treatment for Cattleyas, and may be classed as an easy grower, provided it is not allowed to remain in a decomposed rooting-material.

Upwards of 130 crosses are registered in which *C. labiata* is one parent, and sixteen First Class Certificates and twenty-five Awards of Merit have been awarded to different varieties of this most valuable autumn-flowering Orchid.

The progeny includes some of the finest white and coloured hybrids in existence, and it is hard to state where its influence ends or begins in the race of autumn-flowering Cattleyas of the present day. In the past *C. labiata* was probably the only Cattleya to produce its flowers in the late autumn, to be followed in the early spring by *C. Percivaliana*, *C. Trianae*, *C. Mossiae*, *C. Mendelii*, and *C. Warneri*, all members of the *C. labiata* group. J. T. B.

INDOOR PLANTS.

THE TUBEROSE.

THE Tuberose, *Polianthes tuberosa*, is much esteemed for its delightfully fragrant, white flowers, although it used to be more popular than it is at present.

By according it the necessary treatment, the Tuberose may be had in bloom over a long period. The bulbs are usually imported at the latter end of the year, and should be potted in successional batches; good loam suits them well, and to it may be added a small portion of leaf-soil and some sharp sand; pots of five-inch and six-inch diameter, in accordance with the size of the bulbs, will be large enough. Until the roots have made some progress, water should be applied with the greatest care; when well-rooted, the early batches should be plunged in a bottom heat of 60° to 70°, the temperature of the house in the daytime, with air admitted, being about 70°. The later batches may be stood on a moist base in a pit or house, and introduced into greater warmth as required. When growing freely, the plants should be kept near the roof-glass, thereby counteracting a natural tendency to tall growth.

P. tuberosa was introduced from Mexico so long ago as 1629, and is figured in *Bot. Mag.*, t. 1817; the fragrant, white flowers are disposed in a long, terminal raceme, the perianth being funnel-shaped and incurved. Varieties are offered under the names of The Pearl, American, African and Italian, the first-named being the best for general usage. Aphides display some partiality for the Tuberose and must be checked by fumigation. *Ralph E. Arnold.*

CALADIUMS.

THERE are few more beautiful foliage plants than Caladiums, which are suited to all kinds of decorative purposes during the warmer months of the year. I do not know of any foliage plant in which the colouring is more varied—it ranges from white to deepest crimson, and, as they are tuberous-rooted plants, they may, after the foliage has died down in the late autumn, be stored dry until spring, thus making room for winter subjects. They will keep in perfect condition in dwelling rooms for weeks if carefully watered, and anyone who has seen the splendid collections at the leading shows will endorse all I write regarding their decorative qualities.

Those who wish to start a collection should purchase a few corms of named varieties early in the year. These should be placed in boxes of sandy leaf-soil and placed in a warm house. The end of February or early in March is a suitable time to start them into growth. A mild hot-bed will provide moisture quite sufficient to cause growth to start without watering the plants, which is not advisable until they have developed roots. So soon as growth commences, place the plants carefully in well-drained pots according to the size of the tubers, using a rich compost of two parts rough peat, one part fibrous loam, and one part flaky leaf-soil, some old, well-dried cow manure, a liberal sprinkling of half-inch charcoal and silver sand. In potting, shake a little sand around the base of the tuber, just cover it with the soil, and press the latter moderately firmly. Place the plants on the hot-bed again, and do not water them until the roots are active, but daily syringing between the pots will be very beneficial.

A temperature of about 65° will be suitable; as growth progresses apply water as necessary. At that stage stand the plants on a stage covered with ashes or shingle, and keep the shingle damp on all bright days. Admit air at the top of the house, according to the weather, and shade the plants if the sun is bright. The shading, however, should be dispensed with fairly early in the afternoons, as a moderate amount of sunlight will help to bring out the rich tints in the foliage. Air should be admitted early on bright mornings to dry up moisture on the foliage, otherwise the leaves will be liable to scorch if the sunshine reaches them.

Caladiums should not be syringed overhead at any time, but a damp atmosphere should be maintained by damping the stages and floors of the house freely.

If large specimens are desired, the plants may be shifted into larger pots when the roots have reached the sides of the pots, using much the same compost as before with, perhaps, the addition of a little artificial manure. Water the plants sparingly until they are growing freely, and as growth progresses feed the roots with diluted liquid manure and give an occasional top-dressing of some rich fertiliser. To obtain a good effect, the plants may be placed on inverted pots, the largest at the back of the stage, and the others in front, according to their size, so that the characteristics of each may be seen clearly. Air may now be admitted freely during very warm weather, and the plants will then become better adapted for removal and decorative purposes. They will continue in full beauty for several months, and when the foliage shows signs of ripening during the late autumn, water should be withheld gradually and the plants placed where the sun will ripen the tubers.

When the last of the foliage has died away, lay the pots on their sides under the plant stage, where they will not be subjected to drip. The tubers will keep perfectly well if stored in a temperature not lower than 50°; if wintered in a lower temperature than this they will be liable to decay.

Certain varieties increase more rapidly than others, and, when the tubers are shaken out the following spring for repotting, any young ones should be carefully detached, and the wound rubbed with finely powdered charcoal. These young tubers, if potted, will make splendid specimens in a season or two, and the older ones may then be dispensed with. Some of the smaller-growing varieties, such as *C. argyrites*, make splendid little plants for table decorations, or may be used as edging plants on the greenhouse stages. These small-leaved kinds should be divided every season to obtain the best results. *R. W. Thatcher, Carlton Park Gardens, Market Harborough.*

SOME USEFUL CLIMBING PLANTS.

IN most gardens considerable scope is offered for the use of climbing or trailing plants, and by a careful choice of subjects many an old tree or tree stump may be made an object of great beauty, while walls, rustic buildings, trellises and pillars may be clothed with various climbers which add interest to the collection of plants and enhance the beauty of the garden.

The genus *Clematis* provides a host of valuable climbing plants, both species and garden hybrids. *C. Vitalba*, with its fragrant, greenish-white flowers, followed by ornamental, feathery fruits, is a quick-growing climber suitable for covering tree stumps and unsightly objects in the woodland garden. *C. Flammula* is also useful for similar purposes, its small, fragrant flowers being produced in rich profusion. *C. montana* is a highly ornamental species, capable of covering a large area of wall or trellis-work, and a well-grown plant trained on a building, or rambling over a tree where its long trailing growths can be gracefully displayed, produces a wonderful effect during the flowering season in May.

But beautiful as the species are, and useful as they may be for certain purposes, they cannot be compared with the varieties of garden origin in size of flower, brilliance of colour and general effectiveness. Probably no other hardy climbers provide such a gorgeous display of flowers over such a long period as the garden Clematises, for by the use of the various groups the flowering season may extend from May till October. The *Clematis* thrives in a rich, well-drained loam, and on light soils a dressing of good, heavy loam should be added when preparing for planting. The plant is a gross feeder, and annual dressings of manure should be given to maintain health and vigour.

Amongst the *Loniceras* there are many attractive climbers, some of which readily adapt themselves to almost any soil or position and are eminently suitable for covering the tree-trunks and furnishing arbours, pergolas, etc. L.

gigantea superba is a robust-growing plant excellent for clothing old trees. It bears large, yellow flowers, and its evergreen foliage is of a soft green shade. *L. japonica aureo-reticulata* is a rapid grower with beautifully golden-netted leaves that are very effective in the winter. The yellow flowers, borne in late summer, are delightfully fragrant, and the plant is particularly useful for rambling over rocks and banks overhanging water. *L. Periclymenum*, our native Honeysuckle, is a beautiful plant equal to most of the exotic species, and its variety *serotina*, with deep red flowers, is very showy. *L. Hildebrandiana*, a Chinese species, is a showy plant, with large, orange-coloured flowers, but it is, unfortunately, not perfectly hardy in all positions, and should be grown in sheltered corners in the south.

The Jasmines provide us with a few valuable climbers, not the least attractive of which is *Jasminum nudiflorum*, an old winter-flowering favourite and a beautiful plant for walls or pillars. Its long, flexible, green branches produce their clear, yellow flowers in abundance from November onwards and make it most effective. *J. officinale* is a fast grower of rambling habit and will quickly cover a large space; it is excellent for walls, pillars or tree-stumps. Its slender, deep green branches, beautiful, pinnate leaves and pure white, fragrant flowers make it a most attractive plant.

Many of the species of *Vitis* are extremely useful for furnishing pergolas, arbours and pillars, the following being particularly worthy of note. *V. Coignetiae*, a noble plant of vigorous growth with very large leaves of a rich green on the upper surface and a buff shade underneath. The leaves turn to various shades of orange, scarlet and crimson in autumn, when they are very effective.

Vitis heterophylla humulifolia is a slender-growing species with small, lobed leaves. Its small, turquoise blue, spherical fruits are freely produced and very attractive. *V. purpurea* is a fine vine for colour, the leaves being a deep purple throughout the summer, turning to a rich crimson in autumn. *V. Thunbergii* is a highly ornamental vine of vigorous habit with large, handsome leaves which turn a brilliant colour in autumn.

The Ivies form another group of useful climbers of considerable attractiveness when grown on pillars or tree-stumps. *Hedera Helix angulare aurea* is a particularly good plant, with large, bright golden leaves. *H. H. argentea variegata* is a very fine, silver-leaved plant, its large leaves being margined and veined with ivory-white. *H. H. dentata* is a very effective plant, with large, drooping, glossy leaves, and *H. colchica* (*Raegneriana*) is a rapid grower with large, cordate leaves of bright appearance.

The Wistarias are extremely useful and popular deciduous climbers, suitable for furnishing almost any type of support, and they seldom fail to flower profusely. They thrive in a rich, friable loam and when well-established make extraordinary growth in a season. *W. sinensis* is the one most largely grown, and it is very free-flowering, its short racemes of bluish-lilac flowers making a rich display in May and June. *W. multijuga* is remarkable for the length of its racemes which are very beautiful, particularly when hanging from a pergola or bower, but it is not always so free-flowering as *W. sinensis*.

Two species of *Ampelopsis* (now *Vitis*) claim attention as climbing plants. *A. hederacea* (*V. quinquefolia*), the Virginian Creeper, is a rapid grower and unequalled for covering tree-stumps or rocks very quickly. Its long, slender growths hanging gracefully from the arms of an old tree-stump, make a brilliant show of colour in autumn. *A. Veitchii* (*Vitis inconstans*) is also a beautiful rapidly-growing plant, but of more slender habit. Its short, branched tendrils are provided with suckers which enable it to hold fast to any surface, hence it is ideal for covering walls of great height, where it takes on autumnal tints of intense brilliance.

Actinidia chinensis is a comparatively new plant of rapid growth, with large, deep green leaves which in the young state are covered with conspicuous red hairs. It is an excellent

subject for furnishing pergolas and pillars, where its handsome foliage is displayed to perfection.

Aristolochia Sipho is an interesting and remarkable climber of vigorous growth, its dark green, heart-shaped leaves being very effective. It thrives best on light soils and established plants produce their curiously-formed, yellow and purple flowers freely.

Celastrus scandens is a free-growing climber with serrated, glossy leaves and terminal racemes of yellowish flowers, followed by brilliant scarlet fruits. *Periploca graeca* is a handsome twining shrub with simple, lanceolate leaves and clusters of long-stalked, curious, greenish-brown flowers. It is effective on an arch or pergola but should not be planted near a dwelling owing to its unpleasant smell.

Pueraria japonica is a vigorous climber with large, soft green leaves and rosy-purple, Pear-shaped flowers produced in autumn. It is of amazingly quick growth when established, but succeeds best on a light, warm soil.

Polygonum baldschuanicum is probably the most rampant-growing climber we have, its

TREES AND SHRUBS.

THE GOLDEN ELDER.

THE Golden Elder, *Sambucus nigra aurea*, may be considered one of the most valuable of the golden-leaved, hardy shrubs, because of its free growth and adaptability for dry soils and situations. It is sufficiently rich in appearance to justify its admission to the most select shrubbery border, while its free habit also makes it valuable for planting in the more wild places, where it would be liable to get less attention.

Groups of a few plants in prominent positions in shrubbery borders and in the front of plantations make very bright spots throughout the growing season and are wonderfully effective. For distant effect it is extremely useful, and bold groups planted in front of some dark-foliaged subject show up at a long distance with outstanding brightness.

As is usual with golden-leaved subjects, the colour is intensified on dry soils, hence,

FIG. 128.—GAULTHERIA FORRESTII.

R.H.S. Award of Merit, September 28. Fruits dull blue. Shown by Messrs. Robert Veitch and Son. (see p. 272).

stems twining and clinging to anything for support, and it will clothe an old tree-stump or the side of a building in an incredibly short space of time. The large, feathery racemes of pinkish-white flowers are borne in great profusion and are showy and effective from June to September.

Sollya heterophylla, the so-called Australian Blue Bell Creeper, is a quick-growing, evergreen climber for a south or south-west aspect. It succeeds best in light soil and produces its attractive, blue flowers freely in August and September. *Trachelospermum* (*Rhynchospermum*) *jasminoides* is a useful Japanese climber of rapid growth, bearing fragrant, white flowers in summer, but it needs shelter in most gardens.

Hydrangea scandens is especially good for twining round a pillar or tree-trunk. It resembles Ivy in its mode of growth and attaches itself securely to any surface. Roses cannot be omitted from a list of useful climbing plants for nearly all the *Wichuraiana* varieties and Ramblers are eminently suitable for clothing pergolas and pillars, and there is no form in which the Rose grows more gracefully or appears to better effect than when rambling over pillars or similar supports. *W. Auton*.

in choosing a site for planting, care should be taken that the position is well-drained. The position should also be free from overhanging trees, as the beautiful rich golden tint of the leaves will not develop satisfactorily in partial shade. *A. P. C.*

ACTINIDIA CHINENSIS.

THIS deciduous Chinese climber is very useful for clothing large pillars, pergolas, or walls. It is quite hardy and appears to do well in any cool, moist situation. The heart-shaped leaves are of a deep bronze-green, often eight inches to ten inches across, and conspicuously covered with red hairs. One disappointing feature of this otherwise beautiful plant is that the flowers last but a short time. They appear early in July, are bright yellow, about one-and-a-half inch in diameter, and borne in clusters on short spurs.

It is stated that the flowers are succeeded by edible fruits resembling Gooseberries, but a fine specimen here has never fruited. As it is a very rapid grower it should be kept under control or it will encroach on other plants. Established specimens require to be

pruned hard annually; the current season's growth should be cut back to within two or three buds in late autumn, or, at least, a fortnight before the sap rises in spring. *S. Bowler, Ford Manor Gardens, Lingfield.*

CLEMATIS ARMANDII.

THIS is one of the most beautiful of the numerous species of Clematis, being very attractive in bloom during April and early May, and possessing the additional charm of evergreen foliage. It was introduced from central and western China by Mr. E. H. Wilson in 1900, and has proved to be a vigorously-growing and free-flowering climber. Although not absolutely hardy, it flourishes abundantly if given the protection of a wall. When fully grown it is twenty feet or more in height, the growths being clothed with trifoliate leaves of considerable size; the dark, glossy-green leaflets are ovate-lanceolate and sharply pointed.

The flowers are produced in clusters on slender stalks rising from the leaf-axils. They are about two inches across, and consist of from five to eight creamy-white sepals, which are, later, lightly tinged with pink.

Undoubtedly, this Clematis is a first-class plant, and should be included in every choice collection of climbers. *A. G. F.*

BULB GARDEN.

THE GLADIOLUS.

EVERYONE who is in accord with the beautiful can appreciate the joys of the successful grower of the Gladiolus, and it is surprising with what ease even the small grower can achieve success in the cultivation of this wonderful race of plants. Of all the flowers that grow the Gladiolus is one of the most subtle, the most alluring, and the most charming that I know. Wordsworth wrote:—

"To me the meanest flower that blows can give
Thoughts that do often lie too deep for
tears."

From just a little round corm of insignificant appearance, wrapped up in several brown, silky coats, spring, in a very short time, beautiful flowers which bring rays of sunshine to the grower. The ray may be only a red one, but it may also be of soft pink, lavender and yellow, bright rose, violet and orange, rich scarlet and crimson, and sometimes of the purest white. Certain varieties have but one colour, others will have several, and in some are seen the colours of the rainbow, in many combinations and endless variations of shading and blending, feathering and blotching. These joys may be obtained at little cost and with little effort. A little space, reasonably good soil, attention to details of cultivation, and these little brown corms will provide beauty to the garden over a long period, giving daily joy and pleasure to all who visit it. No flower is easier to grow or surer to flower, none more attractive, none more enduring, and it is singularly free from the annoying attacks of blighting disease or destroying insect.

The Gladiolus has been known to cultivation for nearly four hundred years. There are about 150 known species, some natives of South Africa, some of tropical Africa, while others belong to southern Europe and central Asia. The modern varieties are the result of very many years' work by the hybridist, and in making his selection the points for his guidance may be summed up under two headings: decorative value, and what may be termed field points. Under decorative value must be considered colour, surface texture, effectiveness in mass, size of flower, form of flower, spacing of flower, length of stem, inflorescence, attachment of flower to stem, harmony of colour and keeping quality. Under field points are foliage, vigour, productiveness, precocity, length of flowering season, ability of stem to support flowers, plant resistance to wind and capacity of corm reproduction.

Many of the great advances in the development of the Gladiolus have been brought about by crossing the wild species with the best of the cultivated garden varieties. The spotted-

throated Lemoinei type resulted from a cross between the Gandavensis strain and the species purpureo-auratus. The blue varieties have similarly been derived from *G. Papilio*, and the Childsii and Nanceianus varieties from *G. Saundersii*. The earliest flowering varieties, more recently developed, have been obtained from crossings of *G. aurantiacus* and *G. primulinus*.

About seventy-five years ago the attention of the hybridists was directed to the possibility of the Gladiolus, and a new type resulting from the crossing of the South African and Asiatic species was named the Gandavensis type, after the Belgian city of Gand (Ghent). This type brought the Gladiolus to public notice among favourite decorative garden flowers, and its popularity increased rapidly. It was followed by the introduction of some varieties created by Victor Lemoine, of Nancy, which were named the Lemoinei and Nanceianus types. Later crossings made by Max Leichtlin, of Baden-Baden, which were purchased by Childs, gave rise to the Childsii strains. Still later, the yellow-flowered species, *G. primulinus*, was introduced, and has resulted in another strain known as primulinus hybrids, many of which have produced marvellous flowers. Among modern hybridists who have worked on different strains or different types of flowers may be mentioned Kunderd, Prestgard, Hoeg, Van Fleet, Kelway, Kemp, Diener, Bannings and others, but in spite of the vast wealth of strains and varieties now available, finality has by no means been reached and great possibilities are still open.

A hybrid, the offspring of a cross between two species, has wrapped up within itself all the possibilities of both parents, because species transmit to their offspring their own hereditary tendencies. Thus, such hybrids are as useful for crossing as both of the wild parents, in fact, they may be more desirable because of greater vigour, and they are likely to cross more readily with the garden varieties. Many of the wild species are difficult to grow, but this does not mean that they have no value for breeding purposes. The history of our garden varieties prove the contrary, for *G. cruentus*, which is so difficult to handle that it has died out, except possibly in a few botanic gardens, has given us the large and vigorous Princeps, and a whole race of Amaryllis-flowered varieties.

To be a successful plant-breeder one must be somewhat of a dreamer. The breeder must be able to visualise and see in his mind's eye the flower of his dream. He must have an intimate knowledge of his work and breeding stock to enable him to select parents that will give him the object of his dreams. The goal may not be reached in the first crosses by any means, but with persistence and patient waiting, sooner or later, the dream will materialise, and the satisfaction that one experiences from the reaching of the goal more than compensates for all the years of patient waiting and labour. *A. P. C.*

ALPINE GARDEN.

ASPERULA SUBEROSA.

THE Woodruffs include a number of choice alpine gems, some of which are indispensable for the rock garden. Where only one or two Asperulas are required, one should be *Asperula suberosa*, which is one of the very best members of the family for the rock garden. It is sometimes listed as *A. Athoa*, and it is occasionally known as *A. arcadiensis*, which is an even choicer species. When in bloom, *A. suberosa* presents a little carpet of leaves rising from woody stems, the branches being clad with pointed leaves which, in their general effect, have been likened to a tuft of grey velvet. From the axils of the leaves and in spikes at the ends of the branches are produced the trumpet-shaped little flowers, of a charming glowing shade of pink. The plant is not difficult to cultivate. It should be grown in a light, sandy compost containing leaf-soil or peat; and, while some prescribe full sun, I have found that it does quite well in a shady place. But it must have ample drainage,

and in very wet climates a sheet of glass should be arranged over this tiny Woodruff in winter. With care, it may be raised from seeds or increased by cuttings or division.

AJUGA BROCKBANKII.

DIPPING into a book on hardy flowers the other day, I came across a reference to Brockbank's Bugle, *Ajuga Brockbankii*, which was, *inter alia*, said to be a somewhat aggressive plant, that would grow in any soil and in any position. This is all true, so far, but what is said about its aggressiveness would lead the uninitiated to suppose that it was difficult to keep in bounds, and might possibly be unsuited for the very places for which it is best. It has a habit of rambling from the root, no doubt, but not so badly as some other plants more cultivated. I have found it excellent for planting in the crevices of stone steps. Where plants were required for growing in the chinks of paved pathways it has been very useful.

It has also been found suitable for places in the rock garden, where its rambling propensities may be guarded against. It might be planted in the front of a border, too, if care were taken that it did not wander too far, so as to encroach upon the territory of other flowers. The plant is a decidedly good one in the way of colour. It is about six inches high, or a little more, and has good spikes of deep blue flowers and deep green metallic foliage. It is not easy to obtain a plant of its colour and height which will bloom so long in summer, and will require practically no care, except to see that it does not injure other flowers. It is sometimes regarded as a variety of *A. genevensis*. *A. Brockbankii* is one of the hardiest of dwarf perennials.

SEDUM KAMTSCHATICUM.

STONECROPS present us with many plants which give the gardener a minimum of trouble, and among these are a considerable number with high qualities for many purposes. Still, as a rule, they are not extremely popular, and it is to be admitted that they do not all give the display which most owners of gardens would like. Yet they appeal to many on account of their easy growth and their adaptability in providing carpets of good foliage and flowers for the decoration of hot, dry spots, where little but they or the Houseleeks would flourish. For the rock garden, many of them are admirable, and the subject of this note, *Sedum kamtschaticum*, is invaluable. It is of trailing, prostrate habit, and has fair-sized, succulent leaves, and heads of orange-coloured flowers in autumn. It has been rather aptly designated the "Orange Sedum spurium," and this well represents its resemblance to the more generally grown *S. spurium*. It is quite as easy to cultivate as that well-known species, and this is saying a good deal. It is also very simply raised and increased. Seeds may be sown under glass in spring and good plants will be secured by this means. Cuttings strike very readily, and from the trailing branches it is often possible to select a few which have emitted roots where they touch the soil, and these may be severed and planted separately. *S. Arnott.*

WELDENIA CANDIDA.

THIS beautiful *Weldenia* from Mexico and Guatemala is closely allied to *Zebrina*. It flourishes in a peaty compost in a cool, shady situation.

The plant has a long tap root therefore it needs a deep pocket and efficient drainage. The glorious, solitary, snow-white flowers are from one inch to one-and-a-half inch in diameter, freely produced, and clustered together centrally amid the dark green foliage. As a protection against injury by frosts and damp it is advisable to cover the crowns, after the foliage has died down, with Bracken stolons laid cross over the crowns, finally covering them with peat. During extremely severe weather a hand-light or bell-jar should be placed over the whole mound.

The plant is propagated by division, but it is highly doubtful whether enthusiasts would risk the disturbance of an established clump for the sake of increase. *T. D. Boyd.*

HARDY FLOWER BORDER.**TROLLIUS.**

THESE showy, Buttercup-like plants, with deep, glossy-green foliage and large, globular, yellow or orange-coloured flowers, are very serviceable subjects not only for the border but also for cut flower purposes, for which they are admirably suited. They flower at that period of the year when there is often a partial gap, between the real flowers of spring and the bulk of summer flowers.

They are moisture loving plants, and one of the essentials of successful cultivation is a well-worked soil of good depth, preferably on the heavy side. If the soil is light the plants will not flourish, unless a liberal addition of some moisture-holding material is incorporated with it when preparing for planting. Propagation is best effected by division of the clumps immediately after the flowering period.

The original species, *T. asiaticus*, with bright, orange flowers, and *T. europaeus*, a native plant, with yellow flowers are still worth growing, but the genus has been considerably improved

mind some fine groups of it which make a wonderful show annually and which are growing in sticky, heavy soil. *Anemone vitifolia* var. *tomentosa* forms a compact, bushy plant, with erect, branching flower stems, three feet or more high, the first branches arising from the sheathed axils of two leaves similar to the radical ones, while the smaller branches and peduncles higher up the stems arise from involucres composed of two simple leaves which are small and deeply lobed. The stems and peduncles are covered with silky hairs, as also are the undersurfaces of the leaves, and the outer sides of the sepals and petals, in the latter case the down being exceptionally thick and silky. The radical leaves are on long, slender stems, and consist of three long-petioled, cordate leaflets, deeply lobed and coarsely serrated, rich green on the upper surface, but much paler and downy beneath.

The flowers, which are drooping in bud, but erect when fully open, are borne singly on peduncles up to about nine inches in length. They are clear pink, shaded on the outside with purplish-rose, while the golden-anthered stamens form large clusters in the centre. *A. vitifolia* var. *tomentosa* comes true from seeds, which

means of underground growths, or from cuttings of the young growths in spring. It was figured in *Gard. Chron.*, vol. xxviii, p. 183. *A. G. F.*

DELPHINIUM BRUNONIANUM.

A PLANT that is seldom met with in gardens, but which is more widely cultivated than its reputation would suggest, is *Delphinium Brunonianum*. Last year I came across a bed of it in a nursery and was asked the name. I knew the plant quite well, but for the life of me could not at the time remember its name, but on my return home it occurred to me, and I wrote to my enquirer, only to learn that a gardener from a good deal further north had been to the nursery and, as it was grown in the garden of which he had charge, he was able to give its proper title of *D. Brunonianum*.

It is many years since I first saw it in another nursery, and since then I have grown it myself and have seen it in a fair number of places. The reader must be cautioned against supposing that this Tibetan species of Larkspur has any of the nobility of the modern hybrid *Delphiniums* which are such gallant features of so many

FIG. 129.—PAPAVER ORIENTALE VAR. PETER PAN.

in modern times, and many of the recent introductions are highly decorative plants. Amongst these may be mentioned *Orange Glow*, with large flowers of a deep, glowing orange; *Glory of Leiden*, with very large, deep golden-yellow flowers; *Empire Day*, with large orange-yellow flowers and orange-scarlet stamens; and *Canary Bird*, with canary-yellow flowers. *P.*

ANEMONE VITIFOLIA VAR. TOMENTOSA.

RESEMBLING *Anemone japonica* in many respects, this plant is very attractive in the herbaceous border during August and all through September. The type, which has pure white flowers, and which does not seem to winter well in many parts of this country, is a native of North India.

The much hardier variety *tomentosa*, which received an Award of Merit from the Royal Horticultural Society in July, 1917, is a native of China, and was collected by Purdom in 1909. It was also collected (F. 436) by the late Mr. Reginald Farrer, who found it growing plentifully along the Kansu-Tibet border in stony fields and river shingles. Despite the conditions under which it grows naturally, it flourishes in most parts of this country in the open border in ordinary garden soil; in fact, I have in

it usually produces in abundance, and these have proved the handiest method of increase. If given a sunny position and deep, moderately rich soil, this *Anemone* rarely fails to flourish.

ASCLEPIAS HALLII.

THIS Milkweed is a handsome subject for the mixed border, or for grouping in a sunny position in rather light, loamy soil. It is a strong growing, herbaceous perennial, producing numerous stout, erect growths, up to three feet in height, pale green in colour, and thickly clothed with soft, silvery down. The opposite, ovate leaves are about six inches long and three inches broad; both surfaces, though more especially the under one, are covered with down. They are pale green in colour, have entire margins, and petioles about half-an-inch in length.

The strongly-scented flowers are produced in large umbels on short, downy stems arising from between the bases of the leaves, the dull, whitish-purple sepals being acutely reflexed, while the erect, fluted petals are of waxy whiteness, tinted with dull rose. Though the flowers are not of striking colour, they are not unattractive, combining with the downy stems and leaves to produce a handsome effect. This *Asclepias* may be increased by division, as it spreads by

gardens. On the contrary, it is a lowly plant, attaining at the most about a foot high, and is sometimes less in stature. The flowers are by no means brilliant; they are of a dull-looking, light blue, rendered duller than they would be by the hairs which abound upon them.

Its most striking feature, perhaps, to some, is the fact that it is strongly scented with Musk. This is a quite good border flower, but a dull, black-purple sort is often sold for the true *D. Brunonianum*. It may be raised from seeds or increased by division, and grown in sun or shade in ordinary soil. *S. Arnott.*

PAPAVER ORIENTALE VARIETY PETER PAN.

Most Oriental Poppies have such long flower stems that they are of little value in the garden unless supported; the variety *Peter Pan* (Fig. 129), however, is a noteworthy and very useful exception. Its flower stems are only one foot high, strong and erect, and its bright scarlet flowers, of similar size to those of other Oriental Poppies, will withstand wind and rain. *Peter Pan* commences to flower in the early days of June, when few other flowers of such bright colour are open. *J. W. C.*

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C. 2.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Urgent Communications.—If sent by telegraph, these should be addressed "Gard. Chron., Rand;" or by telephone, to Gerrard, 1543.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Letters for Publication as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

Editors and Publisher.—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers.

IDEAL GARDENS AND PLANT LORE.

IN HOMER'S WIDE DOMAINS.

(Continued from page 30.)

ULYSSES has reached the Palace of Alcinous, and now gazes with delight on the entrancing garden, which we have ideally placed near the terrace with broad steps leading thereto. Four acres are devoted to this plot which is surrounded by a green enclosure and protected from the storms and inclement weather.

"Tall, thriving trees confess the fruitful mould;
The reddening Apple ripens here to gold.
Here the blue Fig with luscious juice
o'erflows,
With deeper red the full Pomegranate
glows."

It would, perhaps, be regarded rather as an orchard than a garden, but as the garden of Ulysses, to be described later, is to take the place of the orchard it is desirable to name some of the plants, familiar to Homer, with which this space may be filled before proceeding to study the architectural details. It is the "beds of all various herbs, for ever green" which here "in beauteous order terminate the scene" that for the present claim our attention.

THE POPPY.

Both because it is a plant of brilliant and arresting colour, and because of its properties and remarkable history and associations, the Poppy will require much space. In one bed the somniferous form (*Papaver somniferum*) will tell us a great deal about Opium and supply us with many historical facts. We shall read De Quincey again, review the story of the Opium war, trace the history of the word "Opium" in the Semitic and Far Eastern tongues, and find that the plant-lore of the Poppy needs a volume. Also, in order to let Homer see that still Man, if not Nature, is "red in tooth and claw," and that this Christian age may emulate heroic deeds, we shall sow a bed of Flanders Poppies, "Lest we forget." Better still, that the old poet may see what Mendelism and selection can do, and that

even a non-militant parson may yet have a place in the sun, we will plant Shirley Poppies in some brave spot.

Homer alludes (*Il. viii, 306*) to the drooping capsule of the Poppy or, perchance, the flower.

"As full-blown Poppies, overcharged with rain,
Decline the head, and drooping, kiss the plain,
So sinks the youth."

In Pope's translation we find in a note by the classical scholar, the Rev. T. A. Buckley, a quotation from Tasso (*Gier. Lib., bk. ix, 85*), to illustrate this passage (see "Chandos Classics" ed. p. 149). The Poppy head had its own special designation in Greek, being named a *kodeia*, a term which has, along with its derivatives, a number of interesting associations. *Kode* is the word for Poppy seed, *kodon* means a bell, and *kothon*, which seems to be a dialect-form of the same, was the name given to a cup, goblet or Laconian drinking vessel. That the sleep-giving properties of the Poppy were known in Homer's day we know from an allusion in the *Iliad* (xiv, 499).

For the folk-lore relating to the Poppy one must refer to such works as Dr. Dierbach's *Flora Mythologica*, where much of the old-world lore is set forth. The plant sprang up where the tears of Venus fell as she wept Adonis dead. The Gods of Sleep, variously known as Hypnos (Greek), Somnus (Latin), Thanotos (Death), and Nyx (Night) were either crowned with the flowers of this plant, or are represented as holding them in their hands. Winkelmann informs us further that Cybele carries a Poppy head, while Here or Juno, as well as Hermes, bear the plant in the left hand.

THE ASPHODEL.

The Asphodel will find a place in our Homeric Garden. It grows in such profusion in Corsica and elsewhere in the Mediterranean, as I saw last Easter, that it becomes a pest to the farmer. Having crossed the Styx, as Homer informs us, the shades of the departed passed over a long prairie of Asphodel. The root was formerly used as food by the very poor, and under the name of "Food for a King" (*Cibo regio*) was once highly esteemed. It is said that the flowers in the Elysian Fields produced grains for the nourishment of the deceased, on which account the Greeks planted Asphodel along with Mallows around their graves and sepulchres. The roots were also placed in the tombs that they might serve for the nourishment of the departed. Let us take a quotation from Lucian:—

"I know why Mercury keeps us waiting so long. Down here with us there is nothing to be had but Asphodel, and libations, and oblations; and that in the midst of mist and darkness. Up in heaven, however, it is all bright and clear, and plenty of Ambrosia is there, and nectar without stint."

And now, if we look for the Daffodil in *Skeat's Dictionary* we shall find it under Asphodel and if we so desire we may make this an excuse for bringing Daffadowndillies into our garden as representing folk-lore. The story is familiar in connection with several words in our own as well as other tongues. A letter is added to or dropped from the beginning of a word and the thing is done. We have newt for an ewt (Sussex effe even to-day), and conversely an apron from napron. So, possibly, we get a pedigree something like this for the Daffodil: Asphodelus (Greek), old French *asphodile* and *affrodille* "th' affodill, or Asphrodill flower," *fleur d'affrodille*, Daffodil flower. Many able scholars have disputed the theory, and I leave them to quarrel like dogs over a bone, but very thankful for the opportunity they afford me of adorning my garden with so popular a plant.

But if the Narcissus is one with the Daffodil we may possibly find allusion thereto in the Homeric Hymns (*Cer. viii, 428*). The flower was said to produce torpidity, whence Sophocles speaks of it as the chaplet of Ceres and Proserpine the goddesses of the infernal regions. The pretty Tazetta was formerly known as Pluto's Narcissus, and the flower is intimately associated with death, as well in ancient plant-lore as in modern. It is appropriately used, therefore, in wreaths for the departed.

THE HYACINTH.

The Hyacinth and other flowers are mentioned together in one touching passage in the *Iliad* (xiv, 348 and context). Buckley renders it in the following way:—

"Thus he spake, and the son of Saturn encircled his wife in his arms. And the divine earth produced fresh herbage under them, the dewy Lotus, and the Crocus, and the Hyacinth close and soft, which elevated them from the earth. Upon this (couch) they reclined, and clothed themselves above with a beautiful golden crown; and lucid dew-drops fell from it." Frazer (*Golden Bough*, 1890, i. 103), thinks Homer's picture was perhaps painted from the life.

Milton's description of the couch of Adam and Eve (*Par. Lost*, iv. 700) may here be compared with Pope's translation.

"Underneath the Violet,
Crocus, and Hyacinth with rich inlay
Brodered the ground."

Of the Violet and other flowers we shall write later. Pope introduces the Hyacinth thus:—

"Gazing he spoke, and, kindling at the view,
His eager arms around the goddess threw.
Glad earth perceives, and from her bosom pours
Unbidden herbs and voluntary flowers;
Thick new-born Violets a soft carpet spread,
And clustering Lotos swelled the rising bed,
And sudden Hyacinths and turf bestrow
And flamy Crocus made the mountain glow."

But what was the Hyacinth? It was a flower which gave rise to the epithet "hyacinthine." It has been definitely affirmed by some authorities that it had nothing to do with the plants which we name Hyacinth to-day. One writer claims that it was the blue Sword-Lily or Iris (*I. germanica*, L.), while others favour the Larkspur (*Delphinium*). Happily for us, both these flowers are worthy of a place in our Homeric Garden, and we therefore admit them gladly. Theocritus calls the flower black, and if we would understand this we cannot do better than read the very instructive volume by Dr. Delitzsch entitled *Iris*. The dark hair of Ulysses and the Hyacinth (*Od. vi. 230*) are compared the one with the other. But a once famous botanist named Tenore maintains that a *Gladiolus* (*G. byzantinus*) is intended. This, as Dr. Dierbach remarks, is "Eine Prachtpflanze, die im Orient, aber auch im südlichen Italien wild wächst. Ihr ungefähr zwei Fuss hoher Stengel trägt 5-6 Blumen, die beinahe so gross wie die der Weissen Lilien sind, aber eine schöne carmoisinrothe Farbe haben."

This plant also has the spots which may be read as a Greek word for Woe. Whatever the Hyacinth was, it originated, like so many other plants in Greek mythology, from besprinkled blood. It was the flower of Apollo. Dr. Prior considers it impossible to identify the flower. "Some suppose it to have been the Martagon Lily, some a Gladiolus. The former seems to have been Ovid's plant, the latter that of the Sicilian poets." So, for Ovid's sake, we bring in the Lily to keep the others company.

THE LOTOS OR LOTUS.

Dierbach follows up his remarks, quoted above, by stating that this is a good place to add a brief word respecting Homer's "Lotos oder Honigklee (*Melilotus messanensis* Desf.)." We may quote another passage in which the Lotos is introduced (*Iliad. xxi, 350*). Buckley reads:

"As when an autumnal north wind immediately dries a newly-watered garden, so was the whole plain dried, and it consumed the dead; whereupon he (Vulcan) turned his all-resplendent flame against the river. The Elms were burned up, and the Willows and Tamarisks; the Lotus was consumed, and the rushes and reeds, which grew in great abundance round the beautiful streams of the river."

Our list, however, is becoming so lengthy, and our task so arduous that it is time we gave ourselves a brief space for taking breath. We cannot do better, therefore, than join the Lotos-eaters (*Lotophagi*), and try to digest what has so far been set before us. We may however, return to this study later. *Hilderic Friend.*

GAP AND THE ORANGE LILY.

DURING the present summer a Botanical Congress was held at Gap in the Hautes Alpes. The Congress was attended by a number of savants from various countries, in addition to many local students, reinforced by the pupils of a convent in Marseilles, "captained by a charming lady of Madonna-like beauty." Ireland, north and south, for once undivided, was represented by Professor Augustine Henry, of the National University, who received a warm welcome. We are indebted to a friend of the Professor's for some extracts from a letter describing the delightful gathering at Gap, which is the centre of an earthly paradise in summer, full of glorious wild flowers. At Gap there is also a museum containing many rare collections of the local flora which have been made for years past with that care and enthusiastic energy so characteristic of the French. They have been preserved, as some of them form the work of a life-time, but some are in danger of decay for want of skilled attention. Mrs. Henry, who has joined in preparing many of her husband's collections, presented the Gap Museum with five hundred francs to help in the conservation of these treasures.

Every morning before daylight the eager students started under the guidance of professors, crawling in Indian file, with the aid of small lanterns, along the edges of precipices and up stony ravines. The Forestry Department of France has transformed the slopes of these mountains, once almost deserts, owing to the torrents which swept away all efforts at husbandry. The inhabitants were sunk in wretched poverty, and some had to be transferred to land in Algeria. Now, as the result of forestry, the steep slopes are clothed with valuable timber, the climate is altered and the valleys produce crops of wine, realising £80 an acre; cornfields clothe the sides of the ravines. The luxuriant forests offer glorious walks. The people now grow three crops of hay in the year, and grow also quantities of Cherries, fields of Barley and Rye. The rich plains of Provence are extending up the sides of the mountains. The people of the plains and of the mountains speak not French, but Provençal, and the schools teach only in French. There is much difference of opinion on the subject.

Our savants rested during the torrid heat of the day, from 10 to 4 o'clock. The professors, curés, and various amateurs, engaged in lively discussions, formulated theories, and, to judge by the reports of the *Courier des Alpes*, made speeches after dinner (which was invariably a triumph for the cook). The air was thick with sincere words of praise and appreciation from one to another. Professor Henry said that he was "forced to be eloquent in French." He has discovered in its primal home near Monétier-les-Bains the original wild form of the Orange Lily.

"I am," he stated, "tracing out the history of this sacred flower, dear to the heart of Ulster. It is rare to find it in the wild state, but we found it in profusion in one spot, and saw it in all stages of growth, from the tiny seedling to the adult plant. The orange colour is wonderful here, and the flower is the largest borne by any European plant. I am trying to work out its legendary and historical lore. It is not quite easy, but I shall get at all the facts soon. You can imagine what a wonderful show it makes in a forest glade. . . . There are also two wild fruit trees here, peculiar to this valley, the Plum of Brigançon (*Prunus brigantia*), Villars, now usually classed as a wild Apricot, and the other is a Pear (*Pyrus amygdaliformis*, Villars). The latter is a most graceful, but extremely rare, tree. The French officer who climbed the tree to get some fruit for me was a very brave man, as it was very thorny. He bled profusely, losing more blood than at Verdun. Both these trees are neglected children of the wild, and will be of great use when introduced into cultivation, as they resist drought, live in poor soil and will serve as splendid stocks to be grafted upon. These two trees necessitated much labour. It will take two days to return to the spot where the wild Pear lives. I had the same difficulty with the Orange Lily; but the Professor of Drawing at the College in

Brigançon made a splendid painting of the wild plant.

Gap [is famous for] two wonderful botanists of the eighteenth century. Dominique Chaix, a priest, was a great botanist, and he educated the other, Dominique Villars, whose great book on the flora of Dauphiné ranked as of primary importance in the time of Linnaeus. I have succeeded in obtaining a fine portrait of Villars, but there is no relic of Chaix. It was he who first gave a name to the Orange Lily. He called it *Lilium croceum*."

AQUA SANA.

The village of Monétier-les-Bains has been a watering place since the fourth century,

in cars and charabanes, who rush by it on the Grande Route des Alpes; yet the old conquerors of Gaul did not fail to discover it. Evelyn Gleeson, in "Irish Times," September, 22.

GARDEN NOTES FROM SOUTH-WEST SCOTLAND.

It was a sorrowful sight that presented itself in a neighbour's garden—a fine bush of *Eucryphia pinnatifolia* defoliated by a horde of cater-

FIG. 130.—EUCRYPHIA CORDIFOLIA AT CASTLE KENNEDY.

and the river on which it stands is called Guisane, which was named by the Romans Aqua Sana from the three medicinal springs at the baths, each different, gushing forth warm and reddish-brown, but delicious, water, full of radium and sulphur. To drink this at 5 a.m. ensures the days of Methuseleh.

Professor Henry also discovered Manna on Larch trees, only known in this village. It is like snow on the branches, white and sweet, and is certainly due to aphides. "This Manna is very interesting to me," he stated, "because, on the very day I was born, the famous pharmacologist, Hanbury, found a single branch at Chantemerle, near here. This sample was the only specimen in the British Isles till I procured another which is now at Kew."

This marvellous, health-giving spot is virtually unknown and neglected by the tourists

pillars of the Buff-tip Moth (*Phalera bucephala*). These caterpillars are gregarious, browsing indifferently on Elm, Oak, Beech, Birch, Alder and other deciduous trees. *Eucryphia* must have proved a novel delicacy for them; but a bush of *E. cordifolia* hard by remained unmolested. This caterpillar is easily recognised from its yellow coat, barred with black and plentifully set with hairs. It grows to a length of two inches. The pests scatter in autumn, and one may often see the caterpillars crossing garden paths on their way to pupation.

The fine figure of *Eucryphia cordifolia* at Nymans, given in *The Gardeners' Chronicle* of August 13, described by Mr. Comber as "probably the largest tree of its kind in this country," caused me to ascertain the dimensions of a specimen growing in Lord Stair's grounds at Castle Kennedy (Fig. 130). This was carefully

accomplished, the result showing that it is now exactly the same height, thirty-one feet, as the Nymans tree was in 1926, and somewhat greater in breadth—twelve feet—owing to its having branched into four main stems at one foot from the ground. It is five years younger than the Nymans specimen, having been planted in 1910.

A wrong preposition slipped into my note on *Clerodendrons* (page 249), which reads that in our latitude neither *C. foetidum* nor *C. trichotomum* flowers in September. I meant that they do not flower *till* September, the latter species being very pretty on the 24th of that month, though the display is not nearly so rich as I have seen it at Abbotsbury and elsewhere in the southern counties.

There are strong colours among autumn flowers, wherefore it is wise to make note of harmonious grouping. A rich effect may be ensured by planting the fine blue *Aconitum Fischeri* with *Kniphofia Uvaria* and *Lilium auratum*. *Achillea Golden Plate* is a really good thing, holding aloft its flat, yellow disks on four feet stems that bow not to wind or rain. It accords well with the Willow Gentian (*Gentiana asclepiadea*) or with the purple *Echium plantagineum*, which, though usually treated as an annual, is a true perennial, bearing a constant succession of flowers from June till October.

Lythrum alatum also lasts long in flower. Introduced from North America about one hundred years ago, one seldom sees it in cultivation, though it is distinct and of delicate beauty, usually growing between two and three feet high. *Houttuynia cordata*, a member of the Pepper Order, is not included in the *Kew Hand-List*, which may mean that it is an uncommon plant. It is well worthy of a moist place in the border, where it may spread freely by its long runners. From August to October it never fails to attract approval, its petal-like bracts forming a snow-white setting for the inch-long spikes of yellow-anthered flowers. These are liberally produced, and very conspicuous among the cordate leaves which are richly stained with maroon.

No more precious addition to our autumnal borders has been made in recent years than that of *Gentiana sino-ornata*. This plant has an amazing constitution; sprigs may be pulled out of it at this season without the slightest detriment to the clump; each one has white rootlets attached, and if set in the open ground or a cold frame will grow into a good plant to flower in the following autumn. Would that G. Farreri were as docile!

Everybody knows that lots of people grow *Hydrangea paniculata grandiflora*, of which all the florets are sterile; but the original wild species, whereof half the flowers remain entire, is very seldom seen. Recently, I saw a fine bush of the latter in full flower at Castle Kennedy which convinced me that it was a more desirable plant than the variety which has become so popular. *Herbert Maxwell, Monreith.*

NOTICES OF BOOKS.

The Propagation of Trees and Shrubs.

THIS book* has been written with the object of bringing to prominent notice the various factors necessary for the successful propagation of hardy trees and shrubs. As is well-known, there are certain trees and shrubs that may be increased without much trouble by the most unenlightened amateur, but there are others that present considerable difficulties to the professional propagator.

Chimonanthus fragrans var. *grandiflora* is a shrub that is often difficult to propagate from cuttings; in fact the late Dr. Lindley, upon one occasion, offered a guinea to any student in the Royal Horticultural Society's Gardens who would bring him a rooted cutting of it. Since that time numbers of cuttings of this particular shrub have been rooted, although there are still many people who find it difficult

to propagate. It is the object of the authors in their new work to indicate the different means whereby these so-called difficult plants may be increased, and also to describe the most satisfactory methods for increasing the numerous kinds of trees and shrubs in cultivation. Thus some are best increased by seeds, others by cuttings, others by grafts or buds, others by layering, and so on.

The early part of the book deals with physiological questions concerned with propagation, after which there are chapters dealing with various forms of propagation with descriptions of the manner in which different kinds of seeds should be dealt with, the best time and methods of making cuttings, grafting, layering and budding, the book ending with an alphabetical list of genera with instructions as to the best means of increase. On page 45 the use of the dibber for the insertion of cuttings is condemned. With this we do not agree. Provided a dibber is used in a proper manner it is a very excellent instrument for the insertion of cuttings, and where hundreds of thousands of cuttings have to be inserted quickly it would be difficult to find a better tool. However, this is a

brownish tinted, without dots, or in some species pellucid-dotted.

Flowers solitary (see Fig. 113, showing structure) lateral, large, bractless. Calyx 4 (in one doubtful species, 5)-lobed down to its union with the ovary, often angular. Petals numerous, free or slightly united at the base, cuneately linear. Stamens numerous, erect, no staminodes. Stigmas 7-11, radiating or ascending, stout, plumose; style none. Ovary partly superior, convex or flattish on the top, 7-11 celled; placentas down the centre of the outer wall of the cells.

Capsule convex or flattish-convex on the top, with 7-11 valves and cells; each valve with a pair of expanding keels half as long as itself, ending in fine, awn-like points, without marginal wings; cells roofed with rigid cell-wings and their opening nearly closed by a large tubercle. Seeds small, ovoid, with a small nipple at one end.—Haworth, *Rev. Pl. Succ.*, p. 103 (1821), and N. E. Brown in *The Gardeners' Chronicle*, 1921, Vol. LXX, p. 311.

Species 26 or more, so far as known all natives of the southernmost part of South Africa, between Cape and Albany divisions, extending

FIG. 131.—GLOTTIPHYLLUM.

A. Section through flower of *Glottiphyllum longum*, only two of the ten stigmas shown; B. fruit of *G. arrectum*; C. fruit of *G. fragrans* (?).

small matter, and on the whole the advice given in the book is excellent. Messrs. Dulau and Co. have produced the book well, both letterpress and illustrations being good. *W. D.*

MESEMBRYANTHEMUM.

(Continued from p. 263.)

12.—GLOTTIPHYLLUM, HAW.

VERY dwarf succulent perennials branching close to the ground. Leaves 4 or more to a branch or division of the plant, opposite, crowded or very closely placed, usually three to several times as long as broad, but in a few species occasionally not much longer than broad under natural conditions, those of each pair subequal or unequal in size, and usually with the terminal part of one leaf different in shape from that of the leaf opposed to it, either arranged in two rows or the alternating pairs crossing one another; thick, soft and pulpy in substance, green, rarely whitish-green or

inland so far north as Prince Albert division. The type species is *G. linguiforme*, N. E. Br. (syn. *Mesembryanthemum linguiforme*, L., and *M. scalpratum*, Haw.)

The name is derived from the Greek *glottis*, a tongue, and *phyllon*, a leaf, in allusion to the long, tongue-shaped leaves of several of the species.

I believe that the species of this fine genus are not particularly sought after by those who are interested in this group of plants, because it so often happens that those that are obtainable, although provided with many different names, are found to be so much alike as to evoke but little interest from the cultivator. I think there are three reasons for this, as follow:—(1) Those who are able to name these plants from books, usually use Salm Dyck's fine figures for that purpose, but as I have repeatedly stated, the names therein given are often very untrustworthy, and as it seems that the names in that work are usually accepted as correct without the slightest investigation of their authenticity, plants named by means of those fine figures are very frequently wrongly determined, and as the same species is sometimes figured in the work

*The Propagation of Trees and Shrubs, by G. C. Taylor, B.Sc., and F. P. Knight. Dulau and Co., Ltd., 32, Old Bond St., W. 1. 5s. net.

under two or three names, it is easy to understand how different persons naming the same plant from that book may impose different names upon it. (2) Haworth, apparently unaware of the variability of these plants, described mere forms of one plant as distinct species. (3) There are, in reality, a number of perfectly distinct species of this genus in South Africa, many of which have been introduced into cultivation and described and figured. Most of them increase slowly by branching and therefore are more seldom propagated by that means than they are by seeds, and it is by means of seeds that many (perhaps most) of the cultivated plants are distributed. Now, as many of these plants require to be cross-fertilised to produce seeds, and as it would often happen that only one plant of a given species (especially if it is uncommon) would be in any particular collection, it is easy to understand that hybridisation would frequently occur. So that it appears to me that what has happened is this: the original species died out of cultivation, but plants raised from seeds produced by it survived, but were really hybrids, and these again and again producing seeds by hybridisation to which the same name or names have been given, have resulted in a lot of hybrids, similar in appearance but bearing different names, being distributed among cultivators at the present day. It is now quite difficult, if not impossible, to obtain several of the original species true to name from cultivators in this country or on the continent. For example, I find cultivated in Kew Gardens the following species of *Glottiphyllum* that have been received from various collections in this country and on the continent under the following names as species of *Mesembryanthemum*:—*G. longum* has been received under the names of *M. lucidum*, *M. bigibberatum* and *M. Salmii*! and *G. latum* has been received under the names of *M. bigibberatum*, *M. angustum* var. *heterophyllum*, and *M. longum* var. *declivale*!

Those which I believe to be hybrid forms appear to me to be hardier than some of the true South African species, of which I possess about fourteen distinct kinds, some of which are rather delicate, requiring careful treatment under cultivation.

An account of all the known species was given by me in *The Gardeners' Chronicle*, 1921, Vol. LXX, p. 327 and 336, and 1922, Vol. LXXI, p. 9 and 22. Since that time, however, I have received some new and old species from Mrs. Bolus, Mrs. van der Bijl, Dr. Marloth and Dr. Muir, and with the aid of these I have restudied the described species afresh, and although in the main my conclusions remain the same with regard to synonymy, I have made some important modifications in consequence of the greater amount of living material I have been able to examine, and more especially on account of some very important information I have received from Dr. J. Muir concerning these plants.

Dr. Muir has made the very interesting discovery that under natural conditions some (perhaps most) of the species exist in two different forms that are connected with each other by a series of intermediate forms, so that although the two ends of the series are very different in general appearance they cannot be distinguished as distinct varieties. Dr. Muir states: "At one end of the series is a harder, smaller and darker green plant, often with some tinge of brown or red, with less juice; at the other a lighter green, softer and much larger form. They may both equally well bear flowers, and the smaller form seems a complete example therefore. In the same locality both may be found, the smaller, harder type in more exposed and on shallower soil, for example, on a flat rock or where there is less moisture. The softer, juicier form further away, under the shelter of a shrub, in deeper soil or where moisture is retained longer. Sometimes the harder, smaller form seems merely younger. In cultivation (in South Africa) the harder form gradually, even after a year or two years, seems to change into the other form. But the harder form is more resistant to climatic changes; for example, frost congeals the juices of the softer form, which dies, whilst the harder form survives (see also a note under *G. latum*).

The bevelling and hooks at the ends of the leaves of some species exist in miniature in the harder form and are therefore often not so noticeable as in the more juicy forms. My specimens of *G. Muirii*, of which I had both extreme forms, and of which the smaller and harder form had remained as such since 1924, has now (June 1926) during the past few weeks undergone a change and become greener and juicier and are quickly assuming the other form."

An illustration of these two extreme forms is given in Fig. 132, reproduced from *The Gardeners' Chronicle*, 1921, Vol. LXX, p. 327, where I thought the plant might be *G. pustulatum*, which I had not then seen, but now that I know that species, I find it is distinct and I have named the plant figured *G. erectum*. I there called attention to the remarkable difference between the plants represented growing together in the same pot and raised from seeds taken from the same seed-pod, but did not then understand the significance of it. Dr. Muir's discovery throws light upon it, but does not completely explain the reason for it. At the present time both the plants represented in Fig. 132 are indistinguishable from one another! Did one of the plants obtain most of the water supplied to that pot at the

FIG. 132.—*GLOTTIPHYLLUM ERECTUM*.

expense of the other plant and so partly starve the latter, or is there some other explanation? At any rate, Dr. Muir's discovery clearly supports the view it will be found I have taken under *G. latum*, that all the figures of Salm Dyck's that I have quoted under that species and its variety *cultratum* represent only individual forms of one and the same species, especially as it is confirmed by the fact that in my own greenhouse one plant of *G. latum* is actually transforming itself into the variety *cultratum*, but whether it will perpetually retain the curvature of its leaves, by which alone that variety is distinguished from typical *G. latum*, remains to be seen.

Dr. Muir believes (and in this I quite agree with him) that the early botanists, who did not know of this variation, were misled into mistaking the various forms a single species may assume for distinct species, and adds in a letter: "The whole question of this variation seems regulated by laws acting consistently and regularly, and the different forms do not occur with the bewildering arbitrariness which must appear to exist to one in Europe."

That the variation of the species of this genus under natural conditions has caused and will still cause difficulty in recognising whether any given plant imported into Europe is a distinct species or a variety of another is very evident

and certain. Even during the past year I have been utterly deceived in the case of plants received from Dr. Muir of *G. fragrans* and *G. pustulatum*, whose leaves were so different from those of the plants known to me by these names that I at first made descriptions of them as being new species, and am quite sure that any other botanist or cultivator who had no knowledge of the variation extant in these species would have likewise considered them to be distinct, I therefore direct the notice of cultivators to the sketches of the leaf variations (to appear later) I have made under these two species and call attention to the notes made under those and other species. N. E. Brown.

(To be continued).

PUBLIC PARKS AND GARDENS.

SOME original and effective bedding schemes may be seen in Roundwood Park, Willesden, at the present time, and the Superintendent, Mr. Thomson, has had his successful efforts rewarded this season by the Council by the addition of another good glass house for propagating purposes. For so wet a season the display is especially praiseworthy.

A bed of red and plum-coloured *Coleus Verschaffeltii* contrasts pleasantly with the green foliage of the St. Bruno's Lily, a species of *Anthericum* with which it is associated; an edging of the silver foliage of *Antennaria tomentosa* lightens the colour of the bed. This effective edging and other silver-leaved plants, such as *Centaurea candidissima*, *Helichrysum* and *Santolina Chamaecyparissus* (well-clipped) are extensively used in Roundwood Park.

A bed where grey-green and silver combine admirably with lavender and lighter green is seen in a groundwork of *Nepeta Mussinii* in full flower, and among its lavender flowers stand *Abutilons* and white *Gladioli*. The whole bed is neatly edged with *Santolina Chamaecyparissus* neatly clipped. A similar colour scheme may be seen in a bed of *Verbena venosa* whose lavender-mauve flowers blend with the edging of a silver *Senecio* and *Centaurea candidissima*. In another bed standard *Heliotropes* of the variety President Garfield, edged with *Antennaria tomentosa* and yellow *Violas*, still in flower, provide a deeper tone of mauve. Although these *Heliotropes* were almost defoliated by late frosts, they are now none the worse, and are making a grand display.

The ever popular *Pentstemon Southgate Gem*, with its blood-red flowers with white throats, fills an oval bed, and among these are planted six standard *Fuchsias* of the variety *Lena*.

A pleasing contrast in colours is seen in a bed of the two *Mignon Dahlias*, *Coltness Gem* and *H. J. Jones*, now at their best. The yellow variety is a little taller than its red companion and fills the centre of the bed. Another bed is formed of the variety *H. J. Jones* and a taller, terra-cotta scarlet variety named *Trixie*.

The deep, plum-coloured *Perilla nankinensis* has been very well placed in front of a golden *Privet* hedge, where it shows to full advantage.

At the side of the Park is a large bed of standard *Fuchsias* among which are planted seedling *Cannas* with red-brown leaves, and the whole has a bold, double edging of *Pelargoniums* *Golden Fleece* and *Silver Queen*.

Among a splendid exhibition of *Dahlias*, the varieties *Paul Crampel* and *Our Annie* are outstanding. The former is of the decorative type and semi-dwarf. Its habit, together with the splendid bright terra-cotta red colour of its flowers, renders it an excellent subject for massing in a large bed. The delicate pink and yellow shades of *Our Annie* are very pretty; it is a small, *Paeony*-flowered variety. *Lemur*, with deep blood-red flowers and dark foliage, would be more useful if it were easier to propagate, for it does not develop many shoots suitable for use as cuttings.

Carpet bedding, in another part of this park, is popular with the public. The plants used include *Alternanthera The Jewel*, with dazzling red foliage; *A. aurea*, yellow, and also a red-

brown variety of the same species; *Spergula pilifera* and its yellow variety *aurea* and, among grey-foliaged plants, dwarf incrustated *Saxifragas*, a *Mesembryanthemum*, *Kleinia repens*, which is a dwarf succulent plant with almost cylindrical leaves; *Hebeveria Dusty Miller*, and *E. Peacockii*, which has a margin of red to its glaucous leaves.

This little north-west London park is well worth a visit at any time during the spring or summer, for it is always bright, and one feels that the results are the rewards of keen and skilful industry. D. B.

It may surprise many of our readers to learn that Manchester has no fewer than seven hundred employees on the permanent staff of the Parks and Cemeteries Department to manage the 2,000 acres of public pleasure grounds which are distributed over eighty areas. The park staff runs a horticultural society of its own and is able to publish each year an interesting *Journal*, of which the issue for 1927-28 is before us. The *Journal* has as its frontispiece a portrait of the Superintendent, Mr. W. W. Pettigrew, V.M.H., reproduced from a drawing by Mat. Although more or less a caricature, all who know Mr. Pettigrew would recognise at once his characteristic attitude and puckered brow—altogether a striking portrait of this very capable and most lovable of men. The editor has given a somewhat full biography of this noted park-keeper, who recently received the highest honour in the horticultural world, that of the Victoria Medal of Honour.

Mr. Pettigrew is only fifty-nine years of age, yet he has had a wide experience, and long before he took up his duties at Manchester he was a prominent figure in the horticultural world. During the twenty-three years he was chief of the Cardiff parks, he laid out five parks and numerous open spaces, and built up a department with a permanent staff of about one hundred. He went to Manchester in 1925, and we trust that he will be spared for many years to continue in that important office.

A number of short articles, such as "Park Systems Extensions," by Mr. L. E. Morgan; "The Culture of the Perpetual-flowering Carnation," by Mr. A. Birkinshaw; "Trees and Water Supplies," by Mr. A. Edwards; "The Development of the Rhododendron," by Mr. F. Harding; "The Use of Dot Plants in Bedding," by Mr. G. Cule; "Flower Gardening in Grass," by Mr. G. Haig, and others show that the *Journal* is valuable as well as interesting. The Society is fortunate in having some of the most prominent gardeners and specialists in particular subjects on the syllabus of the lectures for the winter session, and we are pleased to notice that these lectures are open to all interested persons, whether members of the Society or the Parks Department. There is also a syllabus of classes for students during the months of October, November, December, January, February and March. The *Journal* may be obtained from the Hon. Secretary, Mr. L. E. Morgan, Guildhall Chambers, 38-40, Lloyd Street (Albert Square), Manchester, price 1s. 2d., post free.

THE Ministry of Health has held an enquiry at the Council Offices, Camberley, into an application by the Frimley Urban District Council for sanction to purchase land on the Watchetts Estate for a recreation ground.

HORNCHURCH Town Council has purchased Hylands Park at a cost of £2,500 for a recreation ground.

THE Urban District Council of Shelf will make application to the Ministry of Health for an Order respecting the conversion of the Denholme Gate housing site into a pleasure and recreation ground.

THE Urban District Council of Brentwood, Essex, has approved the purchase of about twelve acres of land, at a cost of £2,000, for the provision of playing fields and a recreation ground.

CHESTERFIELD Town Council has made application to the Ministry of Health for sanction to borrow £9,960 for the laying-out, fencing and providing necessary equipment for seven recreation grounds.

LLANDUDNO Urban District Council has agreed to offer £5,000 for the purchase of the Haulfre estate on the south-eastern slope of the Great Orme for public pleasure grounds.

GREASE-BANDING FRUIT TREES.

GREASE-BANDING is an old and well established garden and orchard practice. Within the last year or so it has been stated that with modern insecticides and the improved spraying apparatus now at our command, grease-banding is no longer necessary. On gardens and farms where a full spraying programme is carried out each year, this is undoubtedly true, but such gardens and fruit farms are few and far between.

In the light of the above paragraph, it can do no harm to review the advantages and limitations of grease-banding fruit trees. The caterpillars which cause serious damage to Apple, Pear and Plum foliage in early spring are generally of the following kinds: Winter Moth (*Cheimatobia brumata*), Mottled Umber Moth (*Hybernica defoliaria*), March Moth (*Anisopteryx aescularia*), Tortrix Moths (*Tortrix* sp.) and Bud Moth (*Hedya ocellana*). These moths fall very naturally into two groups, the first three, Winter, Umber and March Moths, form group No. 1, because the females of each do not possess wings which are of the slightest use for flying purposes. The Tortrix and Bud Moths form the second group because both sexes are fully winged.

Grease-banding has for its object the trapping of the so-called wingless females of the first group, and, of course, can have no control over the fully winged females of the second group. In conditions where both groups are common, grease-banding can only hope to control a portion of the trouble, and it becomes necessary to spray the hosts with an insecticide in the spring, and it would seem as though the grease-banding operation might be left out altogether. At the same time it should be remembered that some caterpillars hatch very early in the season and much damage is often done to the young buds and flower trusses before the average gardener thinks about using an insecticide and, in my experience, it is the caterpillars of the No. 1 group which are responsible for this very early damage. In this connection one finds, too, that it is the caterpillars of the Winter Moth that do most of this early damage. I do not find that Umber and March Moth larvae do much damage to bud growth, but that they confine their attention more to the foliage.

Another point which is often advanced in connection with grease-banding is that it is very successful with standard trees, but that it is not so with bush fruit trees, because, in the former type of tree the band may be placed well away from the ground, while in the latter the band must be placed very near the ground level. The low banding of fruit trees has two serious disadvantages. One is that when bands have to be placed near to the ground level many of the wingless females get over the bands; how they do so has never been ascertained, but it has been suggested that the males are able to carry the females short distances when in the act of pairing. This fact has not yet, I believe, been observed, and it requires actual observation before being accepted as true. The second disadvantage is that when the trees to be banded are growing in open land, low bands become splashed with soil, and many of the moths can get over the soiled bands. This appears to be the most probable means whereby the females get over the bands. Perhaps, some day, an observer will be able to definitely clear up this point, but until this happens we can only guess. If it is true that low bands on trees grown in open soil are very largely

useless because of soil splashing, would it not be a practical proposition to straw down the soil around the stem before the band was put into position? We use this practice freely on our Strawberry beds to keep rain from splashing the fruits and making them gritty, and I think the idea would work in connection with grease-banding.

When discussing the grease-banding of standard and bush fruit trees, it is usual to point out that with the machine generally available (a knapsack) it is easy to spray bush trees for caterpillars but not so easy to do standard trees. This fact should be kept in mind when deciding to band or not to band.

I wonder if I dare mention another point in connection with banding! Grease-banding is not and cannot be a control measure for Codlin Moth (*Cydia pomonella*). I have met many who, when talking about "maggotty Apples," have said, "this maggot takes half my crop each year, and I grease-band every autumn, but with no effect." The confusion no doubt, arises because bands of a different type are recommended as a control measure for Codlin Moth, and those concerned have "got mixed." Hay or sack bands placed in position in June will trap many of the larvae of the Codlin Moth, but the pests have all got safely into their winter quarters before grease-bands are put into position.

To sum up, I think all will agree that grease-banding is a valuable aid in the control of a large proportion of caterpillar attack in spring. It is successful if care is taken in placing the bands in position early enough to trap the first moths which emerge and in keeping the bands in a tacky condition until the end of March. Grease-banding is valuable, too, because it prevents early bud damage. Standard trees are more successfully banded than are bush trees, but this is cancelled out by the greater ease with which bush trees can be sprayed with an insecticide in spring. The grave disadvantage is that it is often necessary to spray fruit trees in spring for caterpillars which are not controlled by grease-banding, but in spite of this, I think it pays to grease-band.

I have tried to point out in a previous note that if grease-banding is to be a full control, the eggs which are laid on the main stem, from the band down to the ground level, should be destroyed when the bands are removed in March. There are many who always leave the bands in position until the following autumn; this is bad practice. All grease-bands should be removed and burnt at the end of March, and the main stems of the trees thickly lime-washed to deal with the eggs laid thereon. Somerset.

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, Ante pp. 131-137).

(Continued from p. 271).

MIDLAND COUNTIES.

STAFFORDSHIRE.—In the middle of April there was promise of abundant crops of all kinds of fruits, but the severe frost at the end of this month destroyed the prospects. Plums were set and about the size of Sweet Pea seeds, but nearly every one was killed. Pear trees were in full bloom and the flowers were frozen. A few late flowers have set some fruits. Bush fruits escaped injury very well. The early flower trusses of Strawberries were killed, but the later blooms set a fair crop. Insect pests have not been so bad as in some years, and the trees are making good, clean growth. Taking the fruit crops all round, I have had many worse crops than in 1927. The soil is a deep, stiff clay. The garden slopes to the south and is well protected from east and north-east winds. J. W. Miskin, Woodseat Gardens, Rocester.

—The fruit crops are the most disappointing I have ever known. Apple trees were laden with blossoms, but, owing to the late frosts, the fruits dropped badly. Pears, also, have fallen freely. Bush fruits have been fairly

LAELIO-CATTLEYA ORIFLAMME

good, but Strawberries, owing to excessive rains, were tasteless and the frost destroyed all the early bloom. Our soil is of a light texture and overlies gravel and rock. *Edwin Thos. Gilman, Hillside, Rugeley, Stafford.*

WARWICKSHIRE.—I never saw a better display of fruit blossom, but severe frosts at the end of April and early in May spoiled the prospects of a good fruit season. The frosts were followed by a wretchedly cold, sunless month. Pears promised well, but Marie Louise d'Ucele alone is carrying a full crop. Apples yielding well are 'Alfriston, King of the Pippins, James Grieve, Potts's Seedling and Warner's King. We have no fruits of Bramley's Seedling or Lane's Prince Albert. Bush fruits were very good. Rain came in time to save the Strawberry and Raspberry crops. Our soil is a heavy clay on limestone. *Charles Marchmont, Moreton Hall Gardens, Moreton Morrell.*

—We had plenty of strong Apricot blossom but the flowers were completely ruined on March 24 by a severe hailstorm, though the trees were under protection. The storm was followed by a wet and stormy period, with snow on the 31st of that month. A magnificent show of fruit blossom generally was ruined by a series of frosts from April 26 to Sunday, May 1; during these dates we registered 4°, 5° (with snow), 2°, 4°, 12° and 5°. On May 4 it was extraordinarily hot, the thermometer registering 79° in the shade, with thunder. What few Strawberry blossoms were left were completely ruined by the very wet weather. The peculiar thing to me is, although Apples, Pears, etc., were so badly damaged, all small fruits were extraordinarily good. A few bushes of Currants and Gooseberries were ruined though the adjoining bushes were not damaged in the least. The soil is of a light, sandy nature overlying sand. *Burton Gaiger, Wellesbourne House Gardens, Warwick.*

—The prospects for a good yield of fruits were exceptionally good until April 29-30, when a severe frost occurred with serious consequences. Pears and Sweet Cherries were practically wiped out. Apples and Plums were severely thinned in most districts, but on high ground or in sheltered positions very little damage was done; consequently the fruit crops are patchy and very difficult to estimate. Fortunately, small fruits, with few exceptions, escaped serious injury, and owing to the copious rains of June, growth has been free from aphids and the fruits attained good size. All crops require thinning. *H. Dunkin, 86, Emscote Road, Warwick.*

—The fruit crops are very disappointing. There was a splendid show of blossom on nearly all fruit trees, but the cold nights and frosts during May seriously injured everything. We registered 6°, 8° and 14° of frost during the last week of May. Strawberries, Raspberries, Black Currants and Pears in the open suffered most. We have a fair sprinkling of Apples and Plums on trees in sheltered positions. In the market gardens of this district it is extraordinary that some Plum orchards are carrying good crops while in others near by there is hardly a Plum to be seen. *A. E. Moss, Billesley Manor Gardens, Alcester.*

—The fruit crops are very irregular; for instance, some Plum and Apple trees only a few hundred yards from this garden are simply laden with fruits, whilst others, and apparently quite as much sheltered, are bare of fruits. Raspberries were a splendid crop, also Black and Red Currants. Gooseberries were thinned by the late frosts, but still the crop was an average one. Cherries were of good quality and clean. The soil is clay resting on clay and difficult to work, but all vegetables and fruits give good and healthy crops. *James Page, Moreton Paddox Gardens, Warwick.*

—From the amount of blossom, I had hoped this year to have reported favourably on the fruit crops, but very severe frosts—10° to 15° on April 29, caused damage to the blossom generally, and more particularly to that of Strawberries,

Plums, Pears, Gooseberries and Currants. The Strawberry crop was the worst for many years. Apart from damage by frost, the plants of many Strawberry beds in this neighbourhood seem to have deteriorated and have given cause for some anxiety. The Apple crop is much better than I expected; trees of Cox's Orange Pippin, James Grieve, Worcester Pearmain and Lane's Prince Albert are carrying quite good crops. Bramley's Seedling, Lady Sudeley and Beauty of Bath are almost a failure, but on the whole there is a good average crop of Apples. *H. F. Smale, Warwick Castle Gardens.*

—Pear blossom was almost ruined by late frosts, which also destroyed the first flower trusses of Strawberries. Early Peaches were also badly cut by the frosts, although late Peaches escaped, as did also Nectarines. Small fruits were exceptionally good. The soil is light and gravelly and the gardens are situated 400 feet above sea-level. *John Samuel Buckby, Bilton Grange Gardens, Rugby.*

(To be continued).

FRUIT GARDEN.

NUTS.

A good variety of the Hazel Nut provides a most welcome addition to the winter supply of dessert, and the cultivation of Nuts or the formation of a Nut orchard may add considerably to the amenities of the garden.

Planting is best performed in October or November, the earlier month for preference, the space allowed each individual plant being governed to a great extent by the variety, but from ten feet to fifteen feet each way may be accepted as a good average distance.

The crops may be considered as permanent, therefore the soil should be prepared thoroughly by trenching and manuring; a good loam and a somewhat dry, sunny situation offer ideal conditions, resulting in the production of short, fruit-bearing wood.

Pruning is of the greatest importance in the successful cultivation of Nuts; not earlier than March, and sometimes even April, is the best period for pruning, as then the female blossoms will be fully open; the plants bear on the lateral growth of the previous summer, therefore the necessity of stopping young and vigorous growths to ensure the development of such shoots will readily be understood, and at the same time it will be well to remove a great deal of the old wood that has borne fruit. In former times, Nuts were frequently trained in the shape of a vase.

Propagation is effected by suckers, layers or by seeds, whilst grafting and budding have been resorted to for the perpetuation of choice or scarce varieties; for all ordinary purposes, suckers and layers offer the most convenient methods of increase, and for the production of layers, "stools" must be maintained. Except when required for propagation, suckers should be removed, and of these Filberts usually produce an abundance.

The maturity of a Filbert or other Nut may be ascertained by the rich brown colour of Nut and husk and by the readiness with which the Nut will part from the latter; before storing, it is necessary to thoroughly dry the Nuts, and they may then be placed in stone jars or in casks and kept in a cool, dry place.

The Nut orchard may well be accorded a prominent position in the garden and rendered singularly attractive by the naturalisation within its precincts of certain bulbs. Narcissi are particularly appropriate, and Cyclamen cannot be envisaged in a more suitable environment than amongst the stems of Hazels. A Nut walk is a delightfully pretty adjunct to a garden, and I possess very happy recollections of such an one; a grass walk with the Nut bushes on either side, their boughs arching overhead and, in spring, innumerable Daffodils—a very pretty and very English picture. Many bulbs are quite happily placed in the Nut plantation, which

indeed, may become a very lovely and most interesting garden feature.

The best varieties of Nuts should be planted and of these the following is a careful selection: Merveille de Bolwiller, a large, handsome Nut, of good flavour, which was first cultivated about 1840, being introduced by Messrs. Baumann, of Bolwiller; Cosford, a large, round Nut of excellent flavour with a thin shell; Kentish Cob, very prolific and of fine flavour, largely grown for market, and sometimes known as Lambert's Filbert, a gentleman by that name being responsible for its introduction somewhere about 1830; Kentish Filbert is a long and pointed Nut of sweet flavour that produces but few catkins, so that a good pollen producer should be planted with it (Cosford or Prolific Filbert); Duke of Edinburgh is a large and quite good Nut, raised by Mr. Webb, of Calcot, and introduced in 1883. Other first-class varieties are Red Filbert, Prolific Filbert and Pearson's Prolific, whilst the Purple-leaved Filbert is a handsome variety of the common Filbert with leaves, husks and shells displaying purple coloration, the Nuts somewhat small but of good flavour. The White Filbert and the Downton Large Square are also worthy of notice.

The crop is subject to injury by the Nut weevil, which pierces the young Nut in spring and inserts a single egg; this, later, forms into a small grub, eats itself out of the Nut, falls to the ground and, burying itself, emerges a perfect insect the ensuing season. Any perforated Nuts that may be shaken off early in the season should be gathered and burnt.

The squirrel is destructive to the Nut crop as also is the Dormouse. Nuts may, with advantage, receive more general and better cultivation than is usually the case. *A. C.*

VEGETABLE GARDEN.

A VARIETY TRIAL OF POTATOS.

I HAVE just completed an interesting variety trial of Potatos. As the varieties were grown under precisely similar conditions they afford reliable and valuable evidence of cropping capacity. The soil in which the trial was conducted is a good medium loam to the depth of eighteen inches; it was dug to the depth of one foot during the winter of 1926-27, and dressed with farmyard manure at the rate of twenty tons per acre at the time of digging.

Owing to the vigour of the growth, no artificial manures were applied. Scotch seed sets having a grading of two-and-a-quarter inches by one-and-a-quarter inch, were used throughout the trial. The tubers were planted during the second week in April at a distance of fourteen inches apart, in drills which were drawn twenty-eight inches asunder; 7 lbs. of seed sets were used of each variety.

The following table gives a list of the varieties grown, together with the yields:—

| Variety. | Ware. lb. ozs. | Chats. lb. ozs. |
|---------------------|-------------------|--------------------|
| Culder's Castle ... | 104 6 | 2 8 |
| Royalty ... | 101 10 | 5 7 |
| Field-Marshal ... | 101 1 | 3 7 |
| Long Keeper ... | 98 10 | 6 1 |
| Dreadnought ... | 94 13 | 5 3 |
| Red King ... | 90 1 | 6 2 |
| Adirondack ... | 50 2 | 8 12 |

As the length of drill was fifty feet in each instance the above table shows that every variety, save Adirondack, has a useful cropping capacity. The latter variety revealed mosaic disease in the early stages of growth, and the low yield supplies eloquent evidence of its paralysing effect. The appearance and cooking quality of the six satisfactory cropping varieties should help to establish them in the favour of gardeners everywhere. *Geo. H. Copley, N.D.H.*

HOME CORRESPONDENCE.

Blue Tits and Plums.—On page 252 of your issue of September 24, in an article on "Plums on Walls," there is a reference to the damage done to fruit by blue tits. If the writer will refer to Dr. Collinge's *The Food of Some British Wild Birds*, he will see that a large number of post-mortem examinations have shown that these birds eat large quantities of aphides, scale insects, etc., and that, although they do peck holes in ripe fruits, their presence in a garden is distinctly beneficial. For some years we have encouraged all the tits here and watched them collecting food from the trees in the spring, but have never seen any trace of fruit being attacked. I do not think that gardeners always appreciate the good done to gardens by birds. *W. H. Nicholls, Shore Croft, Hatherton, Cannock.*

Clogs for the Garden.—Many years ago, when in Lancashire, I rather pitied the vast army of people who wore clogs, as it seemed to me that they must be hard, uncomfortable and heavy. However, finding ordinary boots of a type substantial enough for the garden utterly unwearable as they hurt my feet badly, I tried a pair of light clogs with low uppers, and was astonished and delighted to find they kept my feet dry and comfortable, and were far easier to wear than boots. Clogs are not quite the thing for long outdoor walks, but for field or garden use there is nothing better or more comfortable. They are cheap, but the leather in them is not so good as it should be for resisting wet and must be kept well oiled. There is no reason, however, why one should not have a pair built of better leather. No gardener who has once used clogs will go back to boots for use in his work. I am very enthusiastic in advocating clogs, after years of experience of them in my own garden. *W. J. Farmer, Redruth.*

Erica vagans var. Mr. D. F. Maxwell.—Referring to Mr. Johnson's remarks on *Erica vagans* and its varieties (p. 211), while I agree that *E. v. St. Keverne* is a very fine variety, I cannot agree that *E. v. Mr. D. F. Maxwell* is not a rival. I think the latter is the "peer in its own way," and I feel sure that most people will agree with me. Perhaps, as it is not so old or so common as *E. v. St. Keverne*, it is not yet so well-known, but once seen, I feel sure everyone will want it. *G. H. Dalrymple.*

Araucaria Bidwillii in the Open.—In the gardens of Henapyn, Torquay, there is a very fine specimen of the "Bunya Bunya" Pine, *Araucaria Bidwillii*, twenty-five feet high. I understand this tree was planted by Sir Arthur Bigg. This is the first time I have seen *Araucaria Bidwillii* growing out-of-doors in this country; it would be of interest to learn whether another plant exists in the open in England. *F. G. Cousins, Parks Superintendent, Torquay.*

Edible-Podded Peas.—I have a long row of Carter's edible-podded Sugar Pea named Melting Marrow, growing ten feet high. This is a good Pea to grow where one is troubled with tits (which get through ordinary garden netting), as the pods are gathered before the Peas swell, and they are as fine in flavour as the Peas from ordinary varieties. *J. T. Weston, The Gardens, Hatchford End, Cobham, Surrey.*

Tall Sweet Peas.—I am wondering if any of your readers have Sweet Peas growing taller than mine, which are eleven feet six inches high, have flower stems from ten to eighteen inches long, and blooms one-and-a-half to two-and-a-quarter inches across. The plants have been in bloom since the first week in July; they are trained up stakes and have had the side-shoots pinched out. Also, have your readers heard of Apples occurring on trees the same year as grafted? I grafted one last April with two kinds of Apples and two grafts flowered, one setting three fruits and another one fruit; the fruit is now about the size of a tennis ball, and the variety is Laxton's Superb. *J. T. W.*

Cupressus macrocarpa.—About thirteen years ago a gentleman, then resident at Falmouth, called on me because he was interested in some of my published notes on garden matters. He was a very interesting visitor, and before leaving, he suggested I should plant *Cupressus macrocarpa* as a shelter belt. He obtained seeds and raised the plants himself, and a year later along came a packet of tiny Cypress trees, each about three inches long. I planted them out in a bed in my garden, and after a year's growth they were big enough to go into their permanent places, where they were planted three feet apart. Now, after thirteen years, they are about twenty-five feet high and very thick stemmed. They have mostly grown up tall and straight, but a few are throwing out rather long laterals which will be cut back. It is amazing to see how these little seedlings that would have fitted into my waistcoat pocket have made a very long, tall hedge that effectively checks the gales from the Atlantic, only two miles away. I greatly regret that I do not know the whereabouts of the donor, but I hope this note may find him. *W. J. Farmer, Redruth.*

FIG. 133.—PUYA CHILENSIS AT TREGYE.

Puya chilensis.—This very remarkable species was first introduced into England in 1820. Our plant is illustrated in Fig. 133, and was grown from seeds brought from Chili in 1900. It was kept in a pot for sixteen years and then placed in the open border. It flowered for the first time in 1926, producing one flower spike; this year it produced three spikes and one of these gained a Bronze Medal at the Royal Cornwall Show; the illustration shows the two remaining spikes (average fifteen feet high) (Mrs.). *E. P. Rogers, Tregye, Devon, Cornwall.*

Rubber for Tool Handles.—Secateurs, when purchased, are often anything but smooth to the grip, the metal handles being ridged with fairly sharp lines. There are other tools also that are uncomfortable, raising blisters when much used, but secateurs are the worst, and very often one may have to use them continually for a whole week. I have got over the trouble by obtaining some India-rubber tubing of the type used for gas connections, and forcing it over the metal handles. The slight outlay and trouble has been amply repaid by the comfort obtained and the freedom from galls or blisters, and I wonder why in all the previous years the thought never before occurred to me to use rubber in this way. *W. J. F.*

SOCIETIES.

ELGIN HORTICULTURAL.

THIS exhibition of this Society was originally fixed for August 10 and 11, but the unfavourable season led to a postponement till September 7. The number of entries in all classes constituted a record, especially in the vegetable sections, and a high standard of quality, despite the adverse season and the heavy windstorm experienced a few days before the show, was maintained. The Countess of March, wife of the heir to the Duke of Richmond and Gordon, opened the exhibition.

For the best two greenhouse plants, distinct, Mr. J. H. MUNRO, Forbes, excelled with remarkably well-grown specimens. He also led for Pelargoniums with beautifully coloured blooms. From the ASYLUM GARDENS, Elgin (gr. Mr. John McLaren), came wonderfully good Fuchsias and choice Adiantums. Mr. ALEXANDER SIMPSON, Elgin, showed the best two plants distinct. Mr. M. A. MASSON, Sunnyside, Elgin, and Mr. CHARLES ASHER, Craigowan, Fochabers, led finely for Ferns. Begonias and Aspidistras were best exhibited by Mr. J. SMITH, Glenmoray, Elgin, while Mr. JAMES McBEAN, Bishopmill, and Mr. MACKENZIE, Alves, had the best Hydrangeas and Chrysanthemums, respectively.

From BRODIE CASTLE GARDENS (gr. Mr. J. Annand) came the finest perennials, annuals, Begonias and Chrysanthemums. The EARL OF MORAY, Darnaway Castle (gr. Mr. A. S. Dow), led for Antirrhinums and Stocks. Mr. T. L. MANN, Elgin, was first for Gladioli, and from NEWMILL GARDENS (gr. Mr. A. E. Ross), came the leading Pentstemons. Mr. JAMES McINTOSH, Rosehill, Aberdeen, met with remarkable success over the redoubtable Sweet Pea grower, Mr. J. A. GRIGOR, Woodlands, Banff. Mr. McINTOSH was awarded the leading honours for the best twelve vases, distinct varieties, and was awarded the Silver Rose Bowl presented by Mr. R. G. Mann, Bridge Park, Selkirk, for most points for Sweet Peas in the respective classes, and he also won the Silver Medal presented by Mr. T. L. Mann, Elgin, for the best vase of Sweet Peas in the show. The latter was won by a fine vase of the Hebe variety. But although beaten for the blue riband, Mr. GRIGOR was first for six vases, distinct varieties, three vases, a vase of purple, and a vase of twelve sprays. The last was among the special classes, and the prize was given by Mr. John Smellie, Helensburgh, the well-known grower. There were also prize-winning blooms from BRODIE CASTLE (gr. Mr. J. Annand), the best vases of lavender, white and scarlet varieties coming from there. Mr. J. MACDONALD, Cairnfield, Buckie, who won second and third prizes in several of the classes, was first for a pink variety with a beautiful vase. For six vases of grandiflora Sweet Peas, scented, Mr. J. FERGUSON, Burgie Gardens, won the Medal presented by Mrs. Thomson, Burgie House. The Gold Medal offered by Mr. H. Stewart Paton, of Messrs. Austin and McAslan, nurserymen, Glasgow, for the twelve best Rose blooms (confined to the counties of Moray and Banff), was worthily won by a fine entry from SOUTH COLLEGE GARDENS (gr. Mr. R. Hepburn).

Fruit was the most backward section in the whole show, the effects of the untoward season being evident. From BRODIE CASTLE came the leading dishes of Apricots, Peaches and red Gooseberries; while DARNAWAY CASTLE furnished the best Plums, Black Currants and Red Currants. MOY HOUSE GARDENS provided the leading dishes of dessert Apples and Raspberries. Grapes were not plentiful, those from Mr. C. STUART, Forbes and Moy House being the best.

Vegetables were exceptionally good. For a collection in eight varieties, the leading awards were taken by BRODIE CASTLE, DARNAWAY CASTLE and THE ASYLUM, Elgin (gr. Mr. John McLaren). The largest number of prizes in this division went to Brodie Castle.

Some capital exhibits were shown by amateurs, and it was an Aberdeen amateur, Mr. JAMES McINTOSH, Rosehill, Aberdeen, who won the blue riband for Sweet Peas in a class open to all.

Trade exhibits were shown by Mr. MANN, Florist, Elgin; Messrs. AUSTIN AND MCASLAN, Glasgow, and Messrs. ALLWOOD BROS., Wivelsfield.

NORTH OF ENGLAND HORTICULTURAL.

ALTHOUGH no money prizes were offered, the exhibition of the North of England Horticultural Society, held in the Winter Gardens, Harrogate, on September 14, was a great success. Roses were exhibited in fine style and condition, and the attendance was good. We understand there has been a material increase in the number of fellows of this Society of late. The exhibition was opened by Mrs. C. W. Whitworth, Mayoress of Harrogate, who made a charming and appropriate speech before declaring the exhibition open.

MEDAL AWARDS.

Large Gold Medal.—To Messrs. DICKSON AND ROBINSON (with Harrogate Corporation Cup), for Dahlias; Messrs. SAMUEL MCGREDY AND SON (with Ogden Cup), for Roses; Messrs. G. GIBSON AND CO (with Whitehead Cup), for shrubs, Lilies, Roses and herbaceous plants; and Messrs. MANSELL AND HATCHER (with Kathleen Pilkington Cup) for a collection of Orchids.

Gold Medal.—To Messrs. ALEX. DICKSON AND SONS, for Roses; Messrs. JOHN PEED AND SON, for a group of plants; and Mr. THOS. ROBINSON, for Roses.

Large Silver-gilt Medal.—To Messrs. DANIELS BROS. (with Penrose Green Cup), for a collection of fruit; Messrs. KENT AND BRYDON, for herbaceous plants; Messrs. W. AND J. BROWN, for Roses; Mr. CHARLES GREGORY, for Roses; Mr. ALVA J. HALL, Harrogate, for Ferns; Messrs. C. ENGELMANN, LTD., for Carnations; THE BACKHOUSE NURSERIES (YORK) LTD., for rock plants; and to Mr. W. WELLS, for herbaceous plants.

Silver-gilt Medal.—To Messrs. PENNELL AND SONS, for a collection of fruit; Mr. PARSONS, for fruit; Mr. J. MALLENDER, Scrooby, Doncaster, for Tritomas; Mr. P. GARDNER, for table rockery; Messrs. WHITAKER AND WILSON, for Gladioli; Messrs. W. H. SIMPSON AND SONS, for hardy flowers; and Messrs. HEWITTS, LTD., for Delphiniums.

Large Silver Medal.—To Messrs. J. H. WHITE AND CO., for a collection of fruit; Col. TETLEY, Knaresborough (gr. Mr. F. Owrain), for vegetables; Messrs. T. G. TICKLER, LTD., for a collection of fruit and bottled fruit; Messrs. ALLWOOD BROS., for Carnations; Messrs. BAKERS, LTD., for herbaceous flowers.

Silver Medal.—To THE UNITY ALLOTMENTS, Harrogate, for a collection of vegetables; Messrs. HARKNESS AND SONS, for hardy flowers; Mr. W. KERSHAW, for hardy flowers; Messrs. BOWELL AND SKARRATT, for alpine plants; Miss FLORENCE GREEN, Moortown, Leeds, for trained shrubs; and to Messrs. MAXWELL AND BEALE, for table rockery.

Bronze Plaque.—(With Cultural Commendation), to the Rev. C. GALLACHER, Harrogate, for Gloxinias and Streptocarpus.

Award of Merit.—To Messrs. MANSELL AND HATCHER, Rawdon, Leeds, for Cattleya Canberra, Rawdon variety.

In the fruit classes, first prizes were awarded to Mr. J. E. HATHAWAY, Baldersby Park Gardens, Thirsk (with Webster Cup); Capt. COMPTON, Newby Hall, Ripon (gr. Mr. A. Mason), and to Mr. H. METCALFE, Crimble Junction, Harrogate; Mr. J. K. WOODMANSEY, Knaresborough, was second to the last-named competitor.

HAARLEM DAHLIA SHOW.

THE annual Dutch Dahlia exhibition took place this year from September 9 to 11, in the Concert Hall, at Haarlem. Four rooms were occupied by the show, of which one, an upper room, was set aside for novelties. The opening ceremony took place at 2.30 on the 9th ult., and the first speech was made by Mr. E. Th. Witte, the President of the Dutch Dahlia Society, who reminded his hearers that five years ago the Dahlia Show also took place at Haarlem.

He mentioned the fact that Dutch growers were now so much to the fore in Dahlia producing that the German borders were closed to Dutch-grown Dahlias for exhibition; and the fact that a Dutch grower, even if he were a member of the German Dahlia Society, was prohibited from taking his Dahlias to the exhibition, was a proof of the fear of the German growers of Dutch competition.

The general impression made by the show was a very fine one; the exhibits were arranged so as to present a good ensemble, and yet give to each group its due weight and importance. It might, however, have been an improvement if the centre of the hall had been kept free of all but low plants, so as to yield an uninterrupted view from top to bottom. As it was, some tall Palms had the effect of obstructing the view. At the entrance of the large hall was a fine group of florists' work by Mr. C. VAN EMPELEN, of Heemstede, who used not only Dahlias, but also Roses, Cattleyas, etc., to produce a very pleasing effect. Near-by was the group of the firm of Messrs. K. VAN BOURGONDIËN AND SONS, of Hillegom, including a large number of the large-flowered American varieties, such as Jersey Beauty, Robert Treat, and Earle Williams. The exhibitors were far too numerous for all to be mentioned by name, but the group of an amateur society known as "Eigen Tuin" (or "Own Garden") may be cited; the quality and arrangement of the exhibit left something to be desired, but comparison between this amateur group and the exhibits of professional growers is scarcely fair to the former. The new varieties were numerous, but not many were considered worthy of an award. The Hornsveld Cup was awarded to Mr. H. CARLEE, of Haarlem, for a fine lilac variety, Hera, but only three growers entered in this class.

GLASGOW AND WEST OF SCOTLAND.

THIS show was held, for the second year in succession, in the limited accommodation of St. Andrew's Halls, on Wednesday and Thursday, September 7 and 8. In view of the loss sustained in 1926, the schedule was curtailed by the exclusion of less popular classes and the entries were some four hundred fewer in consequence. This reduction enabled additional space to be allotted to the trade exhibits, which were more numerous and varied than was the case last year.

The hall was densely packed at the opening ceremony which was performed by Miss Buchan (O. Douglas, of literary fame), who was accompanied by her brother, Col John Buchan, M.P.

The schedule consisted of 286 classes which were distributed over five separate halls. Pot plants were well represented, and the chief honours in the gardeners' and amateurs' classes were shared by Mr. ALLAN DUNBAR, Belmont, Springburn (three Palms, twelve plants for table decoration, six plants for table decoration, six Nephrolepis, two ornamental foliage Pelargoniums and two pots of Liliums); Mr. JOHN WELSH, Glasgow (stove or greenhouse plants, greenhouse plants in flower, three British Ferns and three scented-leaved Pelargoniums); Mr. WILLIAM CHORLEY, Irvine (Orchids and Begonias); Mr. CLAUDE JENKINS, Cambuslang, (Fuchsias, tuberous Begonias, Chrysanthemums and one Petunia); Mr. JAMES TEMPLETON, Dowanhill (Palm and three ornamental foliage plants); and Mr. PETER AITKEN, Bathgate (alpines).

The Rose classes were well filled and competition in the open classes was keen. Messrs. D. AND W. CROLL, Dundee, excelled in the class for twenty-four blooms of which the crimson varieties, George Dickson, Capt. Kilbee Stuart, Earl Haig and Lieut. Chauré were prominent, while Dame Edith Helen, Noblesse, and Mrs. Henry Bowles, contributed beauty to the exhibit. The same firm also excelled in the class for twelve blooms of red Roses with Earl Haig, and twelve blooms of white or cream Roses with Louise Crette. Mr. R. C. FERGUSON, Dumfermline, excelled with four baskets of decorative Roses, consisting of Los Angeles, Betty Uprichard, Crimson Emblem and Mrs. John Laing, and he was also placed first for twelve blooms of a yellow Rose with Mabel Morse, and twelve

blooms of any other variety with Gorgeous. Messrs. ADAM AND CRAIGMILE, Aberdeen, were successful in the class for twelve blooms of a pink Rose with an outstanding dozen of Mrs. Henry Bowles. In the amateurs' section, Messrs. D. MURCHISON, Kirn, JAS. PATERSON, Leamington, ALEX. HAY, Bathgate, and Mrs. RUSSELL, Newton Mearns, were prominent in the prize list.

Sweet Peas were not so numerous, and the exhibits were somewhat irregular in quality. Mr. JOHN A. GRIGOR, Banff, followed up his success at Southport by winning in the classes for eighteen and twelve vases, and he was also first in the single vase classes for pink, orange-pink and purple, with well-grown specimens of Sunshine, Crusader and Olympia. Mr. JAMES LOGAN, Cumnock, had three first prizes to his credit, and Mr. ALEX. MCMILLAN, Cumnock, staged the best six vases and three vases of Sweet Peas. The latter also excelled for border Carnations, and the remaining honours in that section were won by Mr. CHARLES TRAILL, Gourrock; Mr. ARTHUR ROSS, Kilmarnock; and Mr. JAMES SMITH, Darvel.

Owing to the late season, Chrysanthemums attracted fewer competitors, of whom Mr. JAMES NISBET, Busby, and Mr. CLAUDE JENKINS, Cambuslang, obtained five first and four first prizes respectively.

The classes for herbaceous flowers were exceptionally strong, and the exhibits occupied the staging on one side of the hall. Here Mr. JAMES CURRIE, Barskimming, Mauchline, excelled with six vases of hardy herbaceous flowers, distinct varieties, and six vases of flowers cut from the open, while Mr. J. W. MCKINNON, Ballochmyle, Mauchline, showed best in the class for four vases.

A feature of the Dahlia section was the grand show of Collette varieties. Perhaps the finest blooms in the section were to be found in the six vases consisting of Glen Sannox, Glenmore, John Smellie, Rona, Brilliant and Kangaroo, which secured the first award for Mr. JAMES JACK, Dumbarton, and Messrs. TORRANCE AND HOPKINS had an equally meritorious group in the class for four vases. Mr. ALEX McCOLL, Renton, overcame all opposition in the Cactus class, while Mr. CLAUDE JENKINS staged the best Pompon Dahlias. The Cambuslang competitor also furnished the first prize Antirrhinums.

Messrs. MAIR AND SON, Prestwick, maintained their reputation as exhibitors of Gladioli, but as they only competed in the class for nine vases, Mr. DAVID WHITELAW, Laurencekirk, had no difficulty in securing the honours in the remaining three classes.

Keen interest was taken in the extensive display of Pansies and Violas, where Mr. JAMES PAUL, Killearn, succeeded in five of the nine classes, but he was defeated in the classes for show Pansies by Mr. JAMES HYSLOP, Leadhills.

The number of fruit entries compared unfavourably with that of former years, and while the fruits grown under glass were fairly well furnished, the hardier kinds cultivated in the open reflected in a more or less degree the unseasonable weather. Grape exhibits were of a high standard of quality, and as the various classes were well filled, competition was keen. In the premier contest for eight bunches Mr. DONALD MCINNES, Glamis Castle, who was second at Southport, again occupied that position being eight points behind Mr. JOHN DAVIDSON, Ardencraig, Rosyth, whose strength specially lay in the bunches of Madresfield Court which brought up his total to 63½ points. Mr. CHARLES TRAILL, Castleleven, Gourrock, was placed third, being only half-a-point under the second prize exhibit. Mr. MCINNES found compensation in winning in four other classes, viz., for four bunches, for two bunches of Muscats, for one bunch of Muscats, and one bunch for bloom. Mr. DAVID AIRDRIE, Dunlop House, excelled in the Black Hamburg class, and the competition for a collection of fruit resulted as follows: First, Mr. ALEX. McBEAN, Yester Gardens, Gifford; second Mr. D. CAMPBELL, Copenock Gardens, Thornhill; third, Mr. A. T. HARRISON, Culzean Gardens, Maybole.

There were 732 entries in the vegetable section and in most classes the quality was of a high standard. Potatoes, Onions, Carrots and

Parsnips being noteworthy in that respect. Mr. JOHN GRAY, Uddingston, was successful in both collections, being 14½ and 7 points ahead of the runner up, and he also staged the best specimens of the Bishop and Arran Comrade Potatos, four heads of Celery, and four Cucumbers. Mr. ROBERT A. GRIGOR, Dalswinton Gardens, Dumfries, and Mr. WILLIAM NASH, Mauchline, shared the honours in the remaining Potato classes, but the competitor with the greatest number of prizes to his credit was Mr. JOSEPH DEVEY, Stranraer, whose record included the small vegetable collection of eight varieties, two red Cabbages, six long Beet, four long Beet, four globe Beet, six long Carrots, four long Carrots, six stump-rooted Carrots, four Cos Lettuces and two Cos Lettuces.

TRADE EXHIBITS.

Large Gold Medal—To Messrs. SUTTON AND SONS, Reading, for vegetables; and Messrs. AUSTIN AND MCASLAN, Glasgow, for cut flowers and vegetables.

Gold Medal—To Messrs. C. ENGELMANN AND CO., LTD., Saffron Walden, for Carnations; Messrs. THYNE AND SON, Dundee, for Dahlias and herbaceous plants; Messrs. ALLWOOD BROS., Haywards Heath, for Carnations; Messrs. M. CAMPBELL AND CO., Blantyre, and Messrs. L. R. RUSSELL, Richmond, for Clematis; Messrs. AUSTIN AND MCASLAN, for Roses and alpinas; Messrs. KERR AND CO., Glasgow, for cut flowers; Messrs. WILLIAMSON AND CO., Glasgow, for Roses, alpinas and herbaceous plants; Messrs. DOBBIE AND CO., Edinburgh, for Dahlias; Messrs. STORRIE AND STORRIE, Glencarse, for fruit; Messrs. R. K. GEMMELL AND CO., Glasgow, for Roses and Sweet Peas; Messrs. LEIGHTON, Glasgow, for cut flowers and alpinas; and Messrs. AUSTIN AND MCASLAN, for Potatos.

Silver Medal—To Messrs. BLACKMORE AND LANGDON, Bath, for Begonias and Delphiniums; Messrs. TORRANCE AND HOPKINS, Busby, for Dahlias and Chrysanthemums; Messrs. THOS. DAGG AND SON, Glasgow, for Gladioli; and Messrs. BANNATYNE AND JACKSON, Hamilton, for Dahlias and herbaceous flowers.

Bronze Medal—To Mr. PETER AITKEN, Bathgate, for alpinas; Mr. ALEX. LISTER, Rothesay, for cut flowers; and Messrs. JOHN FORBES, Hawick, for Phloxes and Dahlias.

AWARDS TO NOVELTIES.

First Class Certificates were awarded to a large seedling scarlet Carnation raised at Springburn Park, Glasgow, which may be described as an improved Red Laddie; to a seedling Chrysanthemum named Mrs. Quinton McFadyen, raised by Mr. Alex. McAlpine, Tollcross, an incurved bloom with the outside of the florets bronze and the reverse gold; to a seedling Chrysanthemum, Mrs. John Wilson, raised by Messrs. TORRANCE AND HOPKINS, Busby. This is a new colour in Chrysanthemums, viz., lilac-rose on the outside of the florets and biscuit shade on the reverse.

An Award of Merit was given to the CORPORATION OF GLASGOW for Bomarea Whittonii, raised at the Botanic Gardens, and to Mary McAlpine, a new single white Chrysanthemum.

GUILDFORD AND DISTRICT GARDENERS'.

ONE of the most enjoyable outings of the season took place on Saturday, August 27, when a party of about seventy members visited the gardens of H. O. Serpell, Esq., J.P., (a former High Sheriff of Surrey), at Westcroft Park, Chobham.

Mr. Rolfe, the gardener, conducted the visitors through the well-stocked houses and gardens and pointed out many features of interest. Great improvements have taken place in recent years under Mr. Rolfe's initiative. This visit was made unique by the cordial reception Mr. Serpell accorded his visitors, and the generous hospitality he provided on their behalf. Messrs. Benham (senior and junior) of Chobham, Mr. A. E. Burgess, Horticultural Expert to the Surrey County Council, and others had been invited to meet the members.

Mr. Serpell, in an after-tea speech, said he considered it an honour to receive a visit from the Guildford Gardeners' Association. A few words were added by Mr. Burgess, who congratulated the Association upon the work it is doing. Mr. W. T. Patrick, J.P., the President, thanked Mr. Serpell for the great kindness he had shown the members.

In a belfry in the Park tuneful chimes registered the flight of time, and when the company left the tea-table to saunter beneath the Oaks and Elms, Mr. Rolfe played a full peal on the carillon of eighteen bells. This was followed by a few Old English melodies.

READING AND DISTRICT GARDENERS'.

THE first meeting of the autumn session was held in the Abbey Hall on Monday, September 19, when Mr. J. R. Lloyd presided over an excellent attendance. In the competitive and non-competitive sections many splendid exhibits were staged, and considering the climatic conditions that have prevailed of late, the flowers and fruits were of exceptionally fine quality.

In the competition for three vases of flowers (outdoor grown), three distinct kinds, the first prize was awarded to Mr. A. W. GOWER, The Gardens, Calcot Grange; second, Mr. A. H. FULKER, The Gardens, Elmhurst, Reading; and third, Mr. H. WADE, The Gardens, Mortimer House. For one vase of Roses, not more than twelve stems or sprays, there were eight entries and the first prize was won by Mr. J. WYNN, The Gardens, Hammonds, Checkendon; the second by Mr. RABBITS, The Gardens, Bulmershe; and the third by Mr. A. W. GOWER.

In the non-competitive section, a First Class Certificate was gained by Mr. R. TURNER, Bath Road, Calcot, for extra fine fruits of Kondine Tomatos, whilst Awards of Merit went to Mr. T. C. WAITE, Verona, Basingstoke Road, for nine dishes of Apples; to Mr. C. J. HOWLETT, The Yews, Earley, for seven dishes of Apples; and to Mr. A. E. KIRBY, Amity Road, for Onions and Shallots.

The subject for the evening was "The Floral Garden," and the lecturer, Mr. A. Middleton, The Gardens, Compton Acres, Canford Cliffs, Bournemouth. By the aid of a splendid series of lantern slides, many of which were coloured, and basing his remarks on the gardens elaborated by him at Greenfield Hall, Laleham-on-Thames, Mr. Middleton gave a most interesting and enjoyable lecture. The sections included, lawns, Dutch, Old English, Japanese, rock and water gardens, and many practical hints were given as to their formation and planting. A hearty vote of thanks was accorded to Mr. Middleton for his lecture, and the hope expressed that he would pay a return visit in the near future. Eight new members were elected.

NATIONAL CHRYSANTHEMUM.

THIS Society's Floral Committee met in the Music Gallery, Holland Park Hall, on Monday, September 26, when nine novelties were considered. Mr. D. B. CRANE was re-appointed Chairman of Committee.

FIRST CLASS CERTIFICATES.

Glow. II. 1b.—A decorative variety of good form and substance, and one that should be useful for market. Good stem and foliage, colour bright chestnut, with a little gold edge to the tips of the florets. Very bright and attractive. Shown by Mr. H. SHOESMITH, Junr.

Jack Robbins. II. 1b.—A fairly large flower for the section; flowers full and florets broad and gracefully recurved. Colour deep apricot with a bronzy tint. Shown by Mr. H. SHOESMITH, Junr.

Pearla. II. 1b.—This is a large, spreading flower, measuring six or seven inches in diameter. Good stem and elegant form. Colour clear pearl-pink, or rich silvery-pink. A beautiful flower of lovely colour. Shown by Messrs. CRAGG, HARRISON AND CRAGG.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

At the meeting held on Friday, September 16, the members of Committee present were: Messrs. J. B. Adamson (in the chair), A. Burns, A. Coningsby, J. Evans, Capt. W. Horridge, D. McLeod, W. J. Morgan and H. Arthur. Mr. J. Keeling was invited to sit with the Committee.

FIRST CLASS CERTIFICATES.

Cattleya Mrs. Medo var. Goliath, a large flower of good shape, orange-yellow shading to pink, lip velvety-maroon; *C. Profusion var. Colossus*, a large flower with broad petals and a round, fringed lip. From Mr. JOHN EVANS.

AWARDS OF MERIT.

Cattleya amabilis var. alba marginata; *C. Lady Veitch var. Snowdrift*; *Laelio-Cattleya Soulange var. Phoebus*; and *Cypripedium Rossettii var. Townley*. From J. B. ADAMSON, Esq.

AWARD OF APPRECIATION.

Laelio-Cattleya Carmencita var. Prince of Orange. From J. B. ADAMSON, Esq.

CULTURAL CERTIFICATES.

To Mr. A. BURNS, for *Oncidium incurvum album*; and Mr. J. HOWES, for *Odontoglossum ardentissimum*.

GROUPS.

J. B. ADAMSON, Esq., Blackpool (gr. Mr. J. Howes), staged a group to which a Gold Medal was awarded. *Cattleya Hardyana* vars. *Flammea* and *alba*; *C. Viola*, *C. Vesta*, *C. Venus*, *C. amabile var. alba marginata*, *C. Lady Veitch var. Snowdrift*, *Laelio-Cattleya Hassallii alba*, *L.-C. Soulange var. Phoebus*, *L.-C. Carmencita var. Prince of Orange*, *L.-C. Urbania superbienis*, and *L.-C. Profusion*, were all well shown, with several *Cypripediums* and *Odontoglossums*.

Mrs. BRUCE and Miss WRIGLEY, Bury (gr. Mr. A. Burns), were awarded a Silver Medal for a group that included a fine batch of *Odontoglossum grande*, *Cattleya Soulange*, *Oncidium incurvum album*, and *Cycnoches chlorochilon*.

Captain W. HORRIDGE, Bury (gr. Mr. A. Coningsby), staged *Cattleya Marriotiana alba* and *Dendrobium Victoria-regina*. Messrs. KEELING AND SONS, Bradford, exhibited *Cypripedium Lord Derby*, *C. Shogum*, *C. Beechense superbum* and *Pilumna fragrans*.

Mr. J. EVANS, Colwyn Bay, staged *Cattleya Mrs. Medo var. Goliath*; and *C. Profusion var. Colossus*; Mr. D. McLEOD, Chorlton-cum-Hardy, showed *Cypripedium Rossettii* and *C. Goliath*.

ROYAL HORTICULTURAL.

Awards to Dahlias.

THE following awards have been made to the undermentioned subjects by the Royal Horticultural Society after trial at Wisley.

AWARDS OF MERIT.

(SMALL-FLOWERED PAEONY).—*Elma D. Cook*, sent by Mr. A. J. COBB; *Irma*, sent by Messrs. J. BURRELL AND CO.; and *Mrs. J. Goddard*, sent by Messrs. J. CHEAL AND SONS.

(DECORATIVE).—*Josephine Adair*, W. D. Cartwright, J. L. Crowther and Rev. M. Herbert Lee, these four were sent by Messrs. J. STREDWICK AND SON; *Clown*, sent by Messrs. VAN DER KLOOT; *Freedom*, sent by Messrs. KROON; *Mrs. D. Hepburn*, sent by Messrs. J. CHEAL AND SON; *Fred Ransome*, sent by Messrs. J. STREDWICK AND SON; *Negro*, sent by Messrs. BALLEGRO.

(CACTUS).—*Giant Kriemhilde*, sent by Messrs. BALLEGRO.

HIGHLY COMMENDED.

(SINGLE BEDDING).—Thomas Moore, sent by Mr. J. B. RIDING.

(SINGLE MIGNON).—Coltness Yellow, sent by Mr. C. A. JOHNS; Powerscourt Yellow, sent by Messrs. W. TRESEDER AND CO.; Northern Gem, sent by Messrs. DICKSON AND ROBINSON; Coltness Salmon, sent by Mr. JOHNS; Harold, sent by Messrs. J. CHEAL AND SONS; Kabouter, sent by Messrs. VAN TUBERGEN.

(SMALL-FLOWERED PÆONY).—Cora, sent by Mr. C. TURNER; Ruth and Zillah, both these sent by Messrs. J. BURRELL AND CO.; Florrie, sent by Mr. W. J. UNWIN; Aida, sent by Mr. C. TURNER; Wanda, sent by Messrs. J. BURRELL AND CO.

(DECORATIVE).—Rose Tendre, sent by Messrs. HORNSVELD.

(STAR).—Burford Star, sent by Messrs. J. CHEAL AND SONS.

(CACTUS).—Pink Favourite and La France, both these sent by Messrs. BRUIDEGOM.

Late Culinary Peas.

HIGHLY COMMENDED.

Obituary.

E. A. Mocatta.—Horticulture has lost a good friend by the death of Mr. E. A. Mocatta, of Woburn Place, Addlestone, Surrey, who passed away early on October 1, in his seventy-second year. Mr. Mocatta loved his garden and encouraged those who have had charge of it. Plants, fruits and vegetables have been grown skilfully at Woburn Place by Mr. Thomas Stevenson, a former gardener, and Mr. W. Holden, who succeeded to the charge. On many occasions illustrations have appeared in these pages showing the fine cultivation that obtains at Addlestone, while our reports have shown the high position obtained by the Woburn Place Chrysanthemums at leading exhibitions.

ANSWERS TO CORRESPONDENTS.

FIG TREES; HORSE MANURE; AND ROSES.—*G. A. C.* (1) Fruit can only be effectually protected from birds by netting, and we suggest that even if your Fig trees are large, they might be netted with a rough skeleton wire frame erected over the trees to allow the net to hang clear. Mechanical scarers in the nature of small windmills with rattles attached are often very effective for a time, as also are pieces of glass or metal so hung that they will swing and rattle, but these devices become ineffective as the birds become accustomed to them, and some alteration in the movement must be devised. (2) Horse dung, when properly fermented, is an excellent manure of high fertilising qualities, suitable for both flowers and vegetables and particularly beneficial on cold, stiff soils. Its fertilising properties are highest when the litter has absorbed the urine and become well moistened so that a steady fermentation is fostered in the heap. The time it should be kept depends on this

fermentation, and it may be necessary to turn and moisten the heap if the litter has a tendency to dryness. If the heap is well made and thoroughly moist so that the fermenting process is continuous it should be ready for use in from three to four months. A dressing of such manure as farmyard manure similarly treated would be good for Yew hedges if applied early in the year. (3) Roses cannot thrive in a very light and poor soil, and it would be advisable to remove entirely at least half its bulk and make up with heavy loam and half-rotten cow manure; add coarse bone-meal at the rate of 28 lbs. per load of material, and thoroughly incorporate the whole with the natural soil left. Such a mixture would make a good medium for Roses and there would be no necessity to add peat or sand. The surface manuring of herbaceous borders, Rose beds, etc., during the dormant season is not waste, the soil having the power to absorb and retain salts which may be carried down by rains, but cow manure is not suitable for this purpose owing to its retentive nature. By its use moisture is retained around the crowns of plants, and the surface soil is left wet and cold. For surface dressings, horse manure or vegetable manure is preferable. Cow manure may be used with advantage at this time of the year for incorporating with the soil when preparing for the autumn or winter planting of herbaceous plants, Roses, trees and shrubs.

MUSCAT GRAPES.—*J. G.* The cause of the disparity in the size of your Muscat Grapes is due to imperfect fertilisation. This may be due to defective root action, dryness at the roots, unsuitable atmospheric conditions or the construction of the house, all of which exercise a great influence on the setting of the berries. Next season, when the Grapes are in bloom, tap the rods at midday or pollenate the flowers by means of a soft brush. Bunches which are well exposed to the light invariably set their berries better than those that are shaded, and this fact should be borne in mind when the shoots are being tied into position. The temperature of vineries in which Muscats are grown should never fall below 60°. These Grapes should not be thinned too soon. Good cultivation, well-drained borders and houses skilfully managed are very important factors in the setting and finishing of Muscat Grapes. Apply a dressing of slaked lime to the borders this autumn, and give two or three light dressings of sulphate of potash during the growing season next spring. If you take care not to overcrop the vines and follow our previous advice the Grapes should finish well next year.

NAMES OF FRUITS.—*S. H. W.* *Mère de Ménage*. *F. I.* Plum Autumn Compôte. *W. T. B.* The Plums were smashed when they reached us, therefore it was impossible to name the variety. *J. B.* 1, Reinette de Caux (syn. Dutch Mignonne); 2, Ribston Pippin. *Miss W.* Probably Sturmer Pippin. *W. B.* 1, Dean's Codlin; 2, Reinette de Caux (syn. Dutch Mignonne); 3, Sandringham; 4, Sam Young; 5, Gascoyne's Scarlet; 6, not recognised; 7, Minchull Crab. *W. T. C.* Crabs: 1, Dartmouth; 2, Montreal Beauty; 3, Transcendent; 4, Mrs. John Seden.

REMOVAL OF FRUIT TREES.—*T. W. M.* You cannot remove any trees or shrubs from the garden when you move unless you are a nurseryman or market gardener, and the trees were planted in the way of your business. Unless this is the case, the general property in the trees is in the landlord, and they cannot be removed without his consent. If you are entitled to receive one month's notice to quit, then such notice must be given so as to expire on your rent day.

SWEET PEAS AND BOOK ON VEGETABLES.—*R. W.* If you will send a stamped addressed envelope, we will answer your enquiries through the post.

NEW HORTICULTURAL INVENTIONS.

THESE particulars of New Patents, of interest to readers, have been selected from the Official Journal of Patents, and are published by permission of the Controller of H.M. Stationery Office.

LATEST PATENT APPLICATIONS.

- 23,695.—Bell, I.—Means for securing Celery, etc., for earthing-up. September 7.
23,493.—Blenkin, G. T.—Agricultural machines. September 7.
23,506.—Clayton, C. Implement for cultivating fruit trees, etc. September 7.
23,267.—Edelhoff, A.—Potato-planting machine. September 10.
23,469.—Hutchinson, D. H. A.—Metal spacers for beehives. September 6.

SPECIFICATIONS PUBLISHED.

- 276,835.—Tarr, J. M.—Box or crate for fruit and vegetables.
276,583.—Grimley, W.—Portable pumps or sprayers for horticultural or like purposes.
276,589.—Pearson, H. H.—Shearing implements for pruning purposes.
276,239.—Knowles, A. G.—Means and apparatus for binding Watercress, cut flowers, vegetables, herbs and like articles into bunches, sheaves or bundles.
276,256.—Harris, A. C. M., and Hemus, W.—Glasshouses, hot-houses, or the like for horticultural purposes.

Printed copies of the full published Specifications may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at the uniform price of 1s. each.

Abstract Published.

Lawn-mowers.—Patent No. 274,304.

The tendency of the grass box of a lawn-mower to jolt off when running over bumpy ground has been eliminated by a recent invention of the Derwent Foundry Co. (1920), Ltd., and J. E. V. Jobson, of Derwent Foundry, Exeter Place, Derby. The supporting hooks of the grass-box are prolonged downwards beyond the curved part that engages the supporting-bar, to form tabs or extensions which serve to prevent detachment of the box when it is displaced by jolting. The extension is so shaped as to tend to remain in contact with the bar as the box rises and falls. The neck of the hook is recessed at the bend to the same radius as the bar and is curved to a greater radius so that the box tends automatically to drop into proper position. The lower part of the box engages fixed stops on the machine.

THE LATEST TRADE MARKS.

THIS list of Trade Marks, of interest to readers, has been selected from the Official Trade Marks Journal, and is published by permission of the Controller of H.M. Stationery Office.

OZORITE.

- 479,423.—Chemical substances used for agricultural, horticultural, veterinary and sanitary purposes.—Ozone Chemical Company, Limited, Coal Pit Hill, Talke, Stoke-on-Trent, September 14.

OZOMI.

- 480,167.—A preparation for use as a germicide for spraying trees and the like.—Ozone Chemical Company, Limited, Coal Pit Hill, Talke, Stoke-on-Trent. September 14.

POTA.

- 481,419.—Vermin destroying preparations; and fungus destroying or preventing preparations for horticultural purposes.—I. H. Grabow and Co., 5, Jessensgade, Horsens, Denmark. September 14.

BLOSSOM TIME.

- 483,078.—Fruits and vegetables (for food).—Hugon and Company, Limited, High Bank Works, Ogden Lane, Openshaw, Manchester. September 14.

MARKETS.

COVENT GARDEN, Tuesday, October 4th, 1927.

WE cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Tuesday by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market and the demand, and they may fluctuate, not only from day to day, but occasionally several times in the day.—EDS.

REMARKS. Blooms of the best quality are in somewhat limited supply. Amongst Chrysanthemums there is a shortage of first grade disbudded blooms. All bunch stuff has been realising better prices, white and bronze Chrysanthemums being in greater demand than yellow and pink. Roses have been more plentiful than Carnations and their quality is exceptionally good. The latest arrivals in this department are a few bunches of English-grown Acacia (Mimosa) and a few boxes of St. Brigid

Anemones. A few baskets of Solanum berries, Chillies and Carnations have been received from the south of France during the past week.

REMARKS.—There has been a slightly better tone operating in some sections of the market but, generally, trade has been, and still is, very slow. The very bad weather conditions have been largely responsible for the poor demand for practically every variety of fruit, a marked improvement in the trade being noticeable after even a few hours' sunshine. Hothouse Grapes are in ample supply and quotations are easier. For the few choice English Peaches available there is a demand sufficient to maintain comparatively high prices. English Apples are not quite so plentiful now that the bulk of the Worcester Pearmain crop has been marketed, but even so there has been little or no advance in the selling level as compared with recent figures. Large English cooking Apples are needed, although buyers are not prepared to pay high prices for them. Medium grade Apples of all kinds are a very slow trade. A few specially selected Cox's Orange Pippins are selling fairly well, but there are plenty of ordinary fruits of this variety which sell cheaply. Blackberries, both cultivated and wild, are selling well each day at good prices. Home-grown Pears are moderately plentiful and not selling too badly. This week has seen a considerable influx of Mushrooms, both cultivated and field, with the usual accompaniment of a set back in prices after a period of scarcity and very high prices. Tomatoes sell fairly well, the few new crop fruits being popular. Old crop Tomatoes are in competition with outdoor Jersey fruits, which are abundant and cheap. Hothouse Beans from Guernsey are a variable business; a few have done well, but others the reverse. The finish of outdoor Beans should be near at hand, therefore hothouse Beans will settle down to an improving price level. The cucumber section is doing rather better than of late, prices being more stable. Asparagus from France is selling fairly well, and salads, Beans, Mushrooms, Aubergines, etc., from the same source are also popular. The general vegetable market is quiet. The Potato trade is better, with some increase in prices.

GLASGOW.

Supplies of first grade cut flowers were scarce during the past week, consequently buyers had to concede higher prices. Chrysanthemums dominated the market and values were higher all round, as follow:—Sanctity and Alcalde, 2s. 6d. to 3s. per dozen; No. 2 Bronze, 2s. 6d. to 3s. 6d.; Cranford Yellow, 2s. to 3s.; Phoenix, 2s. to 2s. 3d.; Pink Delight, 3s. to 4s.; Harvester, Phoebe and Betty Spark, 1s. 6d. for 6's; Debutante, 2s. to 2s. 6d.; No. 1 White, 1s. 4d. to 1s. 9d.; Robbie Burns (sprays), 9d. to 1s. (6's); Phoenix and Betty Spark (sprays), 1s.; pink Roses were cheaper at 3s. to 3s. 6d. per dozen; red and white unchanged at 1s. to 2s.; Carnations steady at 2s. 6d. to 3s.; Lilium Harrissii and L. speciosum rubrum 1s. 6d. to 2s. per bunch; Lily-of-the-Valley, 3s. 6d.; Smilax, 1s. to 1s. 6d.; Calendula, 3d. to 4d.; and Asparagus, 9d. to 1s.

The feature of the fruit market was a sharp advance in prices for Apples owing to an acute shortage of American imports. York Imperials rose to 35s. and 40s. per barrel; Gravenstein, 15s. 6d. per case; home-grown Lord Derby, 18s. to 22s. per cwt. Victoria Plums, 7d. to 8d. per lb. selected, and 3d. to 4d. cooking quality; Switzer Plums averaged 4s. 6d. per chip, and Prune Damsons, 11s. to 12s. per sieve; Block's Beurré Hardy Pears 13s. 6d. per half-sieve; Hazel Pears, 12s. per bushel. Lemons were so high as 42s. for Malaga Murcias, and 50s. for Naples brands. Blackberries were dearer at 7d. per lb.; Sunkist Oranges, 27s. to 32s. per case; Grape Fruit, 40s. to 43s.; Californian Plums, 7s. 6d. to 9s.; and new season's Dates 6s. 9d. to 7s. per dozen cartons.

Tomatoes rose to 8d. to 9d. per lb.; Marrows, 4s. to 5s. per dozen; Mushrooms, cheaper at 2s. 6d. to 3s. per lb.; French Beans, 6d. to 8d.; Cauliflowers, 3s. to 6s. per dozen; Cucumbers, 3s. to 7s. and Lettuce 1s. 6d. to 2s.

TRADE NOTE.

PATENTS AND TRADE MARKS.—Any of our readers requiring information and advice respecting Patents, Trade Marks or Designs, should apply to Messrs. Rayner and Co., Patent Agents, of 5, Chancery Lane, London, who will give free advice to readers mentioning *The Gardeners' Chronicle*.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 48° 8'.

ACTUAL TEMPERATURE—

The Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, October 12, 10 a.m. Bar. 30° 5'. Temp. 45°. Weather, Dull.

The Nomenclature of Garden Plants.

It was a sapient Frenchman who remarked long ago that it is easier to learn botany than the names of plants. Things have not become easier since this epigram was made, and so far as garden plants are concerned it is often either altogether impossible or else a matter of prolonged research to discover what is the right name which should be ascribed to this or that plant. It might be supposed that the Vienna Rules of Nomenclature drawn up in 1905 would have banished all uncertainty, but although these rules have been of great assistance to the conscientious gardener they leave many questions of nomenclature unsolved. It is for these reasons, among others, that Dr. J. Valchenier Suringar has been moved to make an appeal on behalf of a subject to which he himself has made such valuable contributions—that of the Nomenclature of Garden Plants.* With so many problems of nomenclature still unsettled, it is useless to blame the nurseryman who adheres to a "good old garden name," for not ascribing the right one to a plant which he knows (or thinks) that he can sell under the one and not under the other. Should he call the Douglas Fir, *Pseudotsuga Douglasii* or must he re-christen it *P. taxifolia*? Should *Pinus maritima* become *P. Pinaster* and the European Larch be known as *Larix decidua*? Ought *Populus balsamifera* to be catalogued as *P. tacamahaca* and *Betula alba* be known as *B. pendula*? *Wistaria sinensis* converted to *W. floribunda* and *Azalea mollis* replace *A. sinensis*? What garden plants should become *Mahonias*, and which should remain *Berberis*? These are difficult problems, and it is no good exclaiming, as Lord Melbourne was wont to exclaim when an eager cabinet colleague raised a knotty political point: "Why can't you leave it alone?" For it is evident that, unless steps are taken to get things better, things nomenclatural will certainly grow worse. Every gardener who cares for accuracy must have experienced the difficulty of trying to worry out the right name for a plant, and none realise more the confusion which at present exists than those who are engaged in horticultural journalism. Dr. Suringar is not content with diagnosing the malady; he also indicates the way in which it may be alleviated. He points out that very useful pioneer work has already been done in Holland and in America. In the latter country a list of *Standardised Plant Names* has been published and is followed by a number of nurserymen. In Holland, with its 1,500 tree and shrub nurseries, valuable results have followed from the recommendations of the Dendrological Society of the Netherlands, formulated by their Committee of Nomenclature, of which Dr. Suringar is the President. Many Dutch nurserymen have adopted the recommendations of the Committee with results which help greatly to illuminate with the light of reason the darkness of chaotic custom. But what is clearly wanted is some authoritative international body which can make recommendations for general adoption and one, moreover, on which nurserymen as well as scientific horticulturists and botanists are represented. There is a golden opportunity for the institution of such a body. In 1930 there are to be held in London, two Congresses—an International Botanical Congress and also an Horticultural Congress. It should, therefore, be possible, if steps are taken betimes—as suggested at the recent Vienna Conference—to arrive at some agreed method for reforming and systematising the nomenclature of garden plants. If, however, nothing be done in the meantime, it is likely that little will be done at the Congresses. We would therefore suggest that the Royal Horticultural Society takes the initiative and seeks the co-operation of other national societies in a preliminary examination of the question, so that when 1930 comes the members of the Congresses may find much of the necessary spade work already done. Towards the doing of this work horticulturists, botanists and nurserymen should all contribute, for unless practical results are reflected in catalogues, any recommendations which are agreed upon will achieve little more than academic success. Those of the romantic school who exclaim with Juliet: "What's in a name? That which we call a Rose by any other name would smell as sweet," forget that with multiplicity of varieties the "other name" might well refer to another and altogether scentless Rose. The problems of nomenclature are many, and the time between now and 1930 is short. No better service

could be done on behalf of gardeners and nurserymen than the introduction of order into the present chaos of nomenclature.

Royal Horticultural Society's Floral and Orchid Committees.—Having received no notice to the contrary, many members of the R.H.S. Floral and Orchid Committees attended the Fruit Show on October 11, only to find their services were not required. Omission to state that these Committees would not sit on the occasion of the Fruit Show was, no doubt, an oversight, but it caused unnecessary expense on the part of certain members—from Oxford, Cambridge, Reading and Tunbridge Wells, for instance—and no small inconvenience. Baron Schröder's Orchid-grower, Mr. Shill, brought up the beautiful new *Brasso-Laellio-Cattleya Ballantineana*, of glorious chrome-yellow, orange, amber, rose and ruby colouring, but "none was there to see"; and Sir John Ramsden sent from his garden at Bulstrode, *Ribes* sp. (K.W. 6028), with ruddy fruits, and the handsome scarlet *Dahlia* named *Dazzler*. Several *Gladioli* and *Chrysanthemums* were also brought up for the consideration of a Committee that did not meet.

New Park for Newport.—Lord Tredegar has given the town of Newport a lease of seventy acres of the Tredegar Deer Park at Bassaleg, at a nominal rent of £2 per annum; the lease is to be during the life of himself and his son. The gift has been gratefully accepted, and provision will be made for football and cricket grounds, tennis courts, hockey pitches and a bowling green, leaving about one-third of the area as pleasure grounds.

Douglas Fir Timber for Tilbury Dock.—The Port of London Authority has decided to use Douglas Fir timber in the new dock extension at Tilbury, on account of its superior durability, and it is estimated that 10,000,000 feet of timber will be required for this work.

Proposed Soil Bureau.—At one of the meetings of the Imperial Agricultural Research Conference, Mr. Ormsby-Gore suggested the formation of a Soil Bureau at Rothamsted, where not only could the soil problems of Great Britain be dealt with, but it might become the distributing centre of the knowledge collected by soil workers in every part of the British Empire. The constitution and functions of the Entomological Bureau at South Kensington and of the Mycological Bureau at Kew were described, and Kew was also regarded as an Imperial Bureau so far as Systematic Botany is concerned. The formation of a Bureau of Economic Botany and Plant Genetics was suggested by the Lovat Council.

Association of Economic Biologists.—The next meeting of this Association will be held at 2.30 p.m. on Friday, October 28, at the Imperial College (Botany Department, Prince Consort Road), South Kensington. Subject: "Agriculture in Tropical Africa." Lectures will be given on (1) "Planting Developments and Difficulties in Nyasaland," by Dr. E. J. Butler, C.I.E., F.R.S., Director of the Imperial Bureau of Mycology; and (2) "The Work of the Amani Institute," by Mr. W. Nowell, D.I.C., F.L.S., Director of the Amani Research Institute, Tanganyika Territory. Students of Biology are cordially invited.

Chadwick Public Lectures, 1927.—This autumn's programme of Chadwick Public Lectures is as wide in scope and as particular in interest as any yet put forward since the institution of the present lecture-scheme, more than fifteen years ago. Beginning with the second annual Malcolm-Morris Memorial Lecture on "Food Poisoning," by Dr. W. G. Savage, in the Hastings Hall of the British Medical Association, Tavistock Square, on Monday, October 17, at 5.15 p.m., the programme includes also an illustrated Travel Digest by Mr. W. Hales, Curator of the Chelsea Physic Garden, entitled "Tropical Vegetation and Some of its Uses to Man," at the Royal Sanitary Institute, on Thursday, October 27, at 5.30; two lectures

* "Nomenclature of Garden Plants. Chaos or Unity?" *Journal of the Royal Horticultural Society*. Vol. LII, Part 2, August, 1927.

on "The History of Housing," by Major Harry Barnes, F.R.I.B.A., in the Lecture Hall of The Royal Society of Arts, on the evenings of November 10 and 22, at 8.15 p.m., and a dissertation on "The Mind and Health," by Colonel Lelean, Professor of Public Health in the University of Edinburgh, early in December, at the Barnes Hall, Royal Society of Medicine. At the "Food Poisoning" lecture some curious specimens will be shown; Dr. Savage is not only Medical Officer of Health for Somerset, but he was associated with the late Sir Malcolm Morris in the production of his *English Public Health History*, and is therefore specially well-qualified to deliver a Malcolm-Morris Memorial Lecture. Lantern slides of many of the splendid photographs of tropical vegetation, brought back by Mr. Hales from his recent tour in the Far East in the interest of the Chelsea Physic Garden, will be shown for the first time on October 27 (at the Chelsea Physic Garden), and Mr. Hales will describe agricultural and horticultural conditions and vegetation as he has seen it in Ceylon, The Malay States, Penang, Singapore, Java and other isles, including crops of a kind quite unfamiliar to our own country, but which have nevertheless many uses for dwellers in the north. From "Tropical Vegetation" and all the beauty and glamour it denotes to the "History of Housing in England" is a far cry, yet there is a synthesis in all Chadwick Lectures since conditions which govern and aid development of health and efficiency in man are studied in them all. Major Harry Barnes may be relied upon for beauty of oratory and for glamour in his manner of presentment of even such a technical subject as the History of Housing which he is dividing into two parts, the first to include an account of the Royal Commission of 1842 and housing after, and the second dealing with the Royal Commission of 1885 and what has been done since. Colonel Lelean, who has bold but sane ideas on the subject he is to handle, will emphasize the importance of starting life with a healthy mind and show the sociological and financial consequences of breeding by the feeble-minded. The whole of this lecture will be illustrated and made plain by graphs and photographs. Sir William J. Collins (Chairman), Sir James Crichton Browne, Sir Frank Baines and Mr. W. E. Riley, all Chadwick Trustees, will preside at these lectures. Full particulars regarding the Chadwick Lectures may be obtained from the Secretary, Mrs. Aubrey Richardson, O.B.E., Offices of the Chadwick Trust, 204, Abbey House, Westminster.

Horticultural Organisers' Conference.—The Horticultural Organisers for the Midland province held a well-attended Conference at the Midland Agricultural and Dairy College, Sutton Bonington, recently, when Mr. T. Wallace, M.Sc., Deputy Director of the Research Station, Long Ashton, opened a discussion on "Recent Researches on the Manuring of Fruit Trees." Mr. Wallace gave a brief review of the results of investigations carried out in America, on the Continent and in the British Isles during the last thirty years, and stated that the results of these investigations served to emphasize the need for fundamental research at the present time. He then gave a comprehensive address, illustrated by lantern slides, in which he detailed the work in progress at Long Ashton, which was followed by a lengthy discussion. The following points were emphasized:—(1) Nitrogen in the form of nitrates or ammonia is the dominant factor in the manuring of fruit trees for growth and crop production; (2) Phosphates appear to have little effect on yield but improve the quality; (3) Potash is varied in its action; on some soils where leaf-scorch is prevalent, potash will cure this trouble; (4) Lime appears comparatively unimportant, even for stone fruits; (5) No general rules could be given for manuring to suit all cases. For example, soils low in calcium and high in potassium content, often caused chlorosis, but in one case chlorosis was being cured by grassing down the orchard.

Exhibition of Fungi in Brussels.—An exhibition of Mushrooms and other fungi, both edible and poisonous, was held at the Brussels Botanic Garden from September 24 to October 2. The exhibition contained a great number

of different species, and special attention was called to the characteristics of certain poisonous toadstools, with a view to avoiding the mortality from this cause which frequently occurs in Belgium. Another feature comprised fungous diseases of garden plants, with suggested remedies; there was also a microscopic section, showing the texture of Mushrooms, their organs of reproduction, etc., and a collection of fungi from the Congo.

Women's Horticultural Work.—The Women's Farm and Garden Association will have its usual stand in the Gilbey Hall at the Dairy Show, to be held at the Agricultural Hall, on October 18 to 22. Advice will be given on all matters relating to agricultural and horticultural work for women. Employers can arrange to interview employees at the stand.

Mr. E. W. King.—One of the most widely-known men in the seed trade is Mr. E. W. King, sole director of Messrs. E. W. King and Co., of Coggeshall, whose portrait appears on this page. About thirty-five years have passed since Mr. King commenced business as a seed grower, with a small warehouse and a three-acre field. Now, he owns nine farms and leases

MR. E. W. KING.

other land and has a total of 1,500 acres under cultivation for the production of those seeds in which he specialises, and, in addition, he has large warehouses at Grange Hill, Coggeshall, and at Kelvedon Station. In the interests of his business, Mr. King has travelled far and visited the seed-growing centres of California and other parts of the United States, as well as the principal centres of the seed industry in Europe. Although well-known for its stock of Wallflowers, Shirley Poppies, Godetias, Larkspurs, Sweet Williams and Candytuft, and perhaps even better known for distributing such useful Sweet Peas as 2LO, Daventry, Gladys, Britannia, Giant Attraction, Doris, Leslie Rundle, The Sultan, and the novelties named Huntsman and Jack Hobbs, his firm does not confine its attention to flower seeds, but conducts a large business in agricultural seeds and garden vegetable seeds of all kinds. Culinary Peas are a speciality and great care is taken to secure true and improved stocks by means of the one-plant system. Mr. King has taken a great interest in the work of the National Sweet Pea Society for a long number of years, and occupied the position of President of that body during four years of the trying war period.

The Jones-Bateman Cup for Research Work among Fruits.—The Secretary of the Royal Horticultural Society desires us to remind those

who intend to compete for the Jones-Bateman Cup, that accounts of their researches should reach him at the offices of the Society, Vincent Square, Westminster, S.W.1, by October 31. This cup, which was presented to the Royal Horticultural Society, in 1920, by Miss L. Jones-Bateman, is a valuable silver-gilt replica of the Warwick Vase. It is offered triennially for researches in the growing of hardy fruits, Figs, Grapes and Peaches, in the open and under glass. Any account of research submitted by a competitor must deal with work carried out by himself in Great Britain or Ireland, mainly during the last five years. The cup will be held for three years by the successful competitor, who must give a bond for its safe return. A successful competitor is eligible to compete on the next or any subsequent occasion when the cup is offered for award. When the cup is relinquished the holder will receive a Hogg Medal specially struck in gold. The accounts of the competitors' work will be submitted to three assessors (two appointed by the Royal Horticultural Society and one by the National Farmers' Union), who will report to the Council of the Society upon the originality and comparative potential value to the fruit-growing industry of the work of the competitors.

British Gladiolus Society's Show, 1928.—This Society's exhibition for 1928 will be held at the Royal Horticultural Society's Hall, Westminster, S.W.1, on Friday, August 10.

Sempervivums.—At the meeting of the Royal Horticultural Society, on Tuesday, October 18, Dr. R. Lloyd Praeger will read a paper at 3 p.m. on "Hunting Sempervivums." Dr. Praeger has been specialising in Sempervivums for many years and is preparing a monograph on the subject, similar to the one he prepared on Sedums. Dr. Hill, Director of the Royal Botanic Gardens, Kew, has kindly offered to lend plants for demonstration at this lecture, and will take the chair.

Scottish Potato Trials.—On the invitation of the Board of Agriculture (Scotland), a representative company of raisers, growers and merchants visited Philpstoun, Linlithgowshire, on Thursday, October 6, when a demonstration was given of the seedling Potatoes under trial. Mr. Mann welcomed the visitors on behalf of the Board, and after Mr. Anderson had explained the objects of the tests in which 4,500 seedlings had been handled in the laboratory at East Craigs last year, Mr. Millar conducted the company over plots where specimen roots of the varieties were on view. As an indication of the table qualities of the outstanding sorts, dishes of cooked Potatoes were submitted for inspection. Out of fifty seedlings in the first year's trials only two were regarded as promising. D.I. raised by Mr. W. B. Pollock, Bishopton, is a first early variety which yielded a heavier crop than Epicure when both were lifted in an immature state in July, and while the tubers of the former were free from blight, those of the latter sort, grown in an adjacent plot, were nearly all affected by disease. N.19, raised by Mr. T. C. Spence, Dunbar, had only one tuber out of sixteen roots affected with blight, and the best root yielded 7 lbs. 2 ozs. of which 6 lbs. 10 ozs. were ware; this is a late variety with a vigorous haulm, quite distinct from King Edward. In the quest for a first-early immune variety that will crop as early and as heavily as Epicure three seedlings held out prospects of success. The best of the trio is No. 520, raised by Mr. Donald McKelvie, Arran. The tubers, which resemble those of Epicure, are few in number but quickly develop to a good size. Plots of the varieties were on view, and Mr. Millar read the following cropping results of trials in different parts of the country:—Cork: No. 520, 19 lbs.; Epicure, 16 lbs. East Craigs: No. 520, 35 lbs.; Epicure, 25 lbs. Lamlash: No. 520, 22½ lbs., Epicure, 13½ lbs. These and other local results represented a remarkable series of successes for No. 520 over Epicure. In another category, Messrs. McGill and Smith's Herald seems likely to be an efficient substitute for Sharpe's Express, Eclipse and Witch Hill. The tubers are of a particularly attractive, thick-oblong shape, with shallow eyes; the foliage has been free from virus disease during the three years' trials,

and the cooking quality was described as excellent. Comparative weights were as follow:—East Craigs: Herald, 17 lbs. 15 ozs.; Sharpe's Express, 9½ lbs.; Eclipse, 13 lbs.; Boghall: Herald, 54 lbs.; Express, 32 lbs.; Eclipse, 65 lbs.; Starmont (Northern Ireland): Herald, 13 tons to the acre; Express, 9 tons 14 cwt.; Strabane: Herald, 10 tons; Express, 11 tons. Chief interest centred in the maincrop seedlings Arran Banner and Doon Star, which have been under observation for three years. The former was described as the best Potato ever grown in the trial grounds, and no other Potato has maintained such a consistent record for weight of crop, having beaten Arran Chief, Great Scot, and other competitors. The tubers of this maincrop variety were sound, when dry, and practically free from blight—a remarkable achievement in view of the fact that water was sometimes inches deep between the drills. The heaviest root weighed in the presence of the company gave a yield of practically 10 lbs, which compares with 14 lbs. in 1926. Doon Star (McGill and Smith) is a possible competitor with Majestic, and has the advantage over that variety of a stronger haulm and much better cooking quality. The tubers are particularly outstanding by reason of their attractive appearance, while the plant is free from virus diseases. Another promising maincrop seedling was Glencoe, raised by Mr. A. McAllister, Dumfries. Mr. Millar announced at the close of the demonstration that the candidates for registration this year were Herald, McKelvie's 408, Doon Star and Arran Banner, and that the results would be announced later in the year.

German Employees' Long Service.—On October 1 the well-known Berlin nursery firm of L. Späth celebrated the fiftieth year of service with the firm of one of its employees, Gustav Guttzeit, who occupies the position of garden inspector. Dr. Späth was present in person, and read a diploma which had been received from the President of the Republic, afterwards congratulating Herr Guttzeit on his long and valuable services to the firm. Many friends and fellow-employees were present and offered their congratulations, and about fifty workers in the firm who had been over twenty-five years in the business also received felicitations.

National Chrysanthemum Society's Show, 1928.—Arrangements have been made to hold the National Chrysanthemum Society's show of 1928 at the Royal Horticultural Society's Hall, on November 1 and 2.

Horticulture in Roumania.—The Roumanian Horticultural Society continues to grow in importance and activity, and has lately received an acquisition of members by reason of the dissolution of a society formerly known as the Timisoara Horticultural Society, which will be now simply a local branch of the parent society. The journal previously published by the smaller society will be discontinued, and the *Revista Horticola* will be reorganised to cope with the increased number of its readers. An important horticultural exhibition is to be held from November 6 to 9, in the Carol Park, Bucarest, under the high patronage of Queen Marie. Unfortunately, the horticultural school which was founded largely owing to the activities of the Society, has not prospered well, pursued, as it has been, by misfortune, including the death—largely from overwork—of the two most active protagonists. Efforts are now being made to utilise the buildings and grounds for a private horticultural school, and the Ministry of Agriculture has been approached for permission; in this way the school may yet serve a useful purpose. The Society has lately been instrumental in inducing the Roumanian Tobacco Régie to sell nicotine in liquid and powder form for horticultural purposes at a reasonable price and with a guarantee of quality. This nicotine, which will shortly be on sale, will be warmly welcomed by growers, as the nicotine on the commercial market is neither reliable nor cheap.

Appointments for the Ensuing Week.—MONDAY, OCTOBER 17: National Chrysanthemum Society's Floral and Executive Committees meet. TUESDAY, OCTOBER 18: Royal Horticultural Society's Committees meet (two days,

Orchid show). WEDNESDAY, OCTOBER 19: Royal Gardeners' Orphan Fund meeting; London Gardens Guild lecture. THURSDAY, OCTOBER 20: Ipswich Gardeners' Association's meeting; Wallington Horticultural Society's lecture. FRIDAY, OCTOBER 21: Association of Economic Biologists meet; Manchester and North of England Orchid Society's meeting. SATURDAY, OCTOBER 22: British Mycological Society's Foray with British Ecological Society at Great Missenden.

"Gardeners' Chronicle" Seventy-five Years Ago.—A *Royal Botanist*.—There is one king in Europe who is a good practical botanist, and who must look back upon the hours spent in the arrangement of his fine herbarium with far more pleasure than upon those wasted in a vain and retrograde course of politics. The

ably and zealously assisted by his equerries and aides-de-camp, and guided by the advice of eminent botanists, who accompanied him as members of his suite. Such a kingly progress had surely never been seen before, unless Alexander the Great may have relieved the monotony of conquering by making occasional natural history excursions with his *quondam* tutor Aristotle. The Montenegrins, on ordinary occasions, very troublesome and by no means trustworthy people—folks who still keep many of the worst habits of the old Scottish Highlanders—were mystified into tranquility by the peculiar proceedings of their royal visitor and his noble attendants. Resolved, however, to render due honour to so distinguished and unusual a guest, they furnished a guard of state to accompany him in all his peregrinations; and, whenever his botanical Majesty stooped to

FIG. 134.—HIBISCUS DIVERSIFOLIUS.
(see p. 306).

monarch in question is His Majesty of Saxony, who, in his scientific career at least, has gained honour and respect. Many are the stories told by his subjects of their ruler's adventures when following his favourite and harmless hobby; how, more than once, astray from his yawning courtiers, he had wandered in search of some vegetable rarity across the frontier of his legitimate dominions and, on attempting to return, was locked up by his own guards as a spy or a smuggler, since he could produce no passport nor give any more proper account of himself than the preposterous assertion that he was their king. Fifteen years ago he made a famous excursion to the stony and piratical little Republic of Montenegro. It was literally a voyage of botanical discovery, and the potentate sailed down the Adriatic in a steamer fitted out with all the appliances of scientific investigation. On its deck he might be seen busily engaged in laying out his plants,

gather a new or rare specimen, the soldiers halted and, with much ceremony, presented arms. *Gard. Chron.*, October 16, 1852.

The Week's Work.

THE ORCHID HOUSES.

By J. T. BARKER, Dunstable, Bedfordshire.

General Remarks.—The sunless weather which, alas, still continues, has not been to the advantage of sun-loving plants. In all districts plants have suffered from the continual wet, cold, sunless season, and in most cases the growth made in the warmer divisions is of a soft and sappy nature, but, fortunately, in the cooler divisions the greater portion of the plants appear to have revelled in the sunless conditions. With shortening days and the decreasing influence of the sun, shading may now be dispensed with altogether. It is impossible to give precise directions as the amount of shading required in the autumn, as much depends on the locality, the aspect of the house, the arrangement of the plants, and the genera to which the plants belong. At the present time, however, the foliage of all Orchids should be sufficiently matured to need no protection from the sun, and the plants may be exposed to full light with safety. The aim of the cultivator should be to make the most of all the light available at this season so as to thoroughly consolidate the growths of all Orchids, thus enabling the plants to pass safely through the winter months.

Watering.—Supplying water to the roots requires much more judgment now than when the plants were in active growth; Orchids cannot be treated collectively in this respect, and the right application or withholding of water is the basis of all successful cultivation. The habits of the various kinds, the state of growth, and the condition of each plant must be considered separately, and the treatment varied according to their separate requirements. Many of the larger, distichous-leaved Orchids are still growing freely and require plenty of moisture until the roots show, by the white film closing over the points, that their season of growth is past. After this, less water will be needed until, in winter, only sufficient should be given to keep both roots and foliage in a plump, healthy condition. In the case of pseudobulbous Orchids that are now fast completing their season's growth, it is a mistake to make drastic changes by withholding or lessening the water supply too suddenly, as the roots of many kinds are most active at this state of their development. There should be less damping down than hitherto, as the humid atmosphere outside promotes good atmospheric conditions within the house, when assisted slightly in the cases of houses that are inclined to dry quickly. The longer nights and cooler atmosphere may necessitate the use of more fire-heat in the cooler divisions, it being better to have some warmth in the pipes, with the ventilators open a little, than to close the house without heat, as a saturated atmosphere, accompanied by a low temperature is injurious to all Orchids.

Temperatures.—During the present month it is advisable in every department to err a trifle on the warm side with the night temperatures, as one sudden fall of several degrees—especially if the plants have been recently watered and the atmosphere has become unduly moist—might do more harm to many tender plants than all the cold weather of winter. No harm will accrue, even in the cool house, should the temperature through the night be a few degrees above the normal, provided the ventilators are opened on all suitable occasions. It is advisable to see that none of the plants are too near the roof-glass as that is a frequent cause of their being chilled, and it is also advisable to gradually reduce the temperature and the moisture so that by the end of the present month we reach the winter level in both.

THE KITCHEN GARDEN.

By R. H. CROCKFORD, Gardener to THE RT. HON. LORD WAVERTREE, Horsley Hall, Gresford, N. Wales.

Broad Beans.—In gardens having a warm aspect, and where the soil is not too heavy, and at the same time is well-drained, a plot should be manured and deeply dug or trenched in readiness for sowing a few rows of Broad Beans towards the end of the present month, or early in November. Choose early varieties, such as Early Prolific and Early Longpod, not forgetting Early Mazagan, which is very suitable for this purpose, being very dwarf and hardy. The seeds should be placed more closely together than when sowing in the spring so as to allow for losses which may occur during the winter. A careful watch must be kept for slugs, and so soon as the plants are about two inches high, a little soil should be drawn up to the stems so as to afford a little shelter should the weather prove very severe during the winter; a few boughs or some light form of protection will also prove beneficial.

Peas.—On warm, early borders which are vacant, the soil should now be manured and deeply dug in readiness for sowing Peas during November and onwards. Only the round-seeded varieties are suitable for sowing at this season. The seeds are best sown in rather narrow drills so that when the soil is drawn up to the sides of the rows it will effectively afford protection. When the young plants are about two or three inches high, place small twigs closely together alongside the rows; these will afford support and some protection against cold winds. Should the weather prove very severe, a temporary shelter of evergreen boughs or Bracken will do much to keep the plants snug. One of the best varieties of Peas for sowing at this season is Selected Pilot. The seeds should be well coated with red lead before sowing and sown more thickly than at ordinary times. Where sparrows are troublesome protection must be afforded either by lines of black cotton or some small-meshed netting, as the young growths are very tempting to birds.

Tomatos.—The past season has been a particularly bad one for ripening these fruits out-of-doors. Any small, green fruits remaining should be gathered and used for making chutney or pickles. Where large fruits still remain the whole stem should be cut off at the base and hung up intact in a warm house to ripen them, for although these may not be good enough for use in the raw state they will be found valuable for cooking. Tomatos which are being grown inside for winter fruiting will need very careful attention from now onwards. Special care must be exercised with the watering can so that the roots do not get too wet, or trouble will quickly follow. Maintain a dry, moderately warm, buoyant atmosphere at all times and remember to pollenate the open flowers daily, either with a camel-hair brush or by sharply tapping the supports.

FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P., Ford Manor, Lingfield, Surrey.

Vines and Vineries.—From now onwards the pruning of vines and the cleansing of vines and vineries will provide continuous work until all, with the exception of late houses, are ready for starting again. Many people use strong insecticides and other mixtures where red spider, mealy bug and other pests are known to be present, and often do more harm than good. Soft soap, sulphur and water and Gishurst Compound, when properly used, are still hard to beat. Repeated washings of infested vines should be most carefully performed, and all cracks and holes in old spurs stopped with pure Gishurst Compound. The cleaning of the vines themselves is not the most difficult part of the business as mealy bug gets into the roof, trellises, walls and the loose surface soil of the borders, where dislodgment is extremely difficult. However, if the cleansing is thorough, and a small brush dipped in methylated spirits is used daily from the time the vines break,

success is assured. Successional vineries containing the remains of crops should now be cleared, to economise fuel and to give the vines a thorough rest before they are pruned.

Muscat Grapes.—All Muscat Grapes are now quite ripe and well coloured; they should not receive over much fire-heat, neither should they be allowed to suffer from damp, which they are liable to during the fall of the leaf. A gentle warmth in the pipes, accompanied by a moderate circulation of air on fine days will keep the Grapes fresh and plump. A temperature ranging from 50° at night, with a slight rise during the day should be high enough, but much depends upon the house and its surroundings; a low, damp situation on wet soils does not allow the admission of fresh, dry air, but by careful attention to details and keeping the ground ventilators closed during the prevalence of wet or foggy weather, there should be no difficulty in keeping the Grapes fresh; of two evils it is better to let them shrivel a little rather than rot.

Late Houses.—In houses where Lady Downes and other thick-skinned Grapes are not well finished, the hot-water-pipes should be kept sufficiently warm to maintain a steady circulation of fresh air, care being taken that sudden falls of temperature do not produce a chill. Houses in which the vines were started early enough and the Grapes are now finished should, like the Muscat house, be kept dry and at a moderate temperature; an excess of fire-heat is liable to cause loss of colour. Any later laterals should be pinched, as the languid growth keeps the roots in action and retards the ripening of the premier leaves.

PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NALL-CAIN, Broomfield Hall, Hertfordshire.

Begonias.—Autumn- and winter-flowering Begonias are now growing freely, and the main shoots of the Mrs. Heal type, Optima, Exquisite and many others, will require staking to prevent them from bending down with the weight of their flowers. These Begonias will provide a display over a long season by allowing the earliest batch to develop all flowers after this date, while the later plants may have the buds removed once more before allowing them to bloom. Encourage these later plants to make healthy growth and form a succession. Unfortunately, these Begonias dislike fogs and when they occur the top ventilators should be kept closed and the atmosphere dry.

Begonia Gloire de Lorraine.—Plants of this Begonia should be kept growing in an intermediate temperature and with less shade than hitherto; stand them near the roof glass to prevent a tendency to a straggling habit of growth. Some of the plants may be allowed to develop their flowers, while others should have their flowers removed to enable them to provide a succession to those that flower from now onwards; apply water to the roots with extra care and use stimulants more liberally than hitherto, as well-rooted examples will need a light stimulant occasionally. Allow the plants sufficient space so that each may form a good specimen; where overcrowding is allowed the plants will not be well clothed with flowers all round. An average night temperature of 55° should be maintained in the house in which they are growing.

Francoa ramosa.—Specimens of the Bridal Wreath will have passed out of flower and will need to be divided and repotted. If this work is done now the plants will have time to form roots in the new compost before the shortest days arrive. Francoa ramosa requires cool treatment at all times, and if the plants are stood in a cool house or frame whence frost is excluded, the conditions will suit them admirably. After potting, they should be kept close for a short time, when, with a little care taken in regard to watering, they will soon recover. The compost used should be on the light side and contain plenty of sand.

Watering.—The business of affording water to plants growing in glasshouses will require a little more care and consideration as the winter advances, as with the lowering of all temperatures in plant houses during the winter it is only natural that a corresponding reduction of atmospheric moisture must be made. During periods of dull, cold weather, the houses should be kept comparatively dry, and the roots of plants be kept slightly on the dry side, but not to such an extent as to cause flagging. When admitting air see that cold draughts are not created, but air must be admitted freely on all favourable occasions, as it is only under these conditions that the atmosphere can be kept sufficiently dry.

HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD, Wrotham Park, Barnet, Middlesex.

Transplanting Young Trees.—Young trees which have been grown and prepared for a few years in the reserve garden may be carefully lifted and replanted at any time after this date, but the sooner the work is done the better it will be for the trees. First thoroughly prepare the stations for the reception of the roots before attempting to lift the trees. The drainage should be the next important item; if the soil is of very heavy texture, a considerable depth of rough material should be used beneath the site; a much less quantity will suffice on better drained soils. The holes for the reception of the roots should be much larger than the root-spread so that there may be no cramping and crowding at planting time. Lift the trees carefully, preserving as many roots as possible. In some cases the trees may be lifted with a goodly portion of soil adhering thereto, placed on mats and carried to the site where they are to be permanently planted. Make sure any damaged ends are cleanly cut, spread the roots out and bury them at suitable depths in the newly prepared soil. Sweet, fertile loam, with old mortar rubble, wood-ash and a little manure added will answer most purposes, with additional lime for all stone fruits.

Lifting Unfruitful Trees.—Trees that have been in position a few years and are making growth that is too strong to be fruitful, should be lifted entirely and replanted afresh; open out a trench around them, two feet deep and at a distance corresponding to the spread of their branches; undermine all the roots as the work proceeds; trim any damaged tips and relay them at equal distances and nearer to the surface than before, placing a little fresh, fine soil amongst them.

American Blight.—Fruit trees that are badly infested with this pest should (after the fruits have been gathered), be thoroughly washed with a good insecticide so as to destroy so many of the insects as possible before the leaves fall. A good cleansing at this season will prove helpful, especially in cases of bad infestation.

THE FLOWER GARDEN.

By JOHN COUTTS, Assistant Curator, Royal Botanic Gardens, Kew.

Herbaceous Borders.—Flower borders should be kept tidy by removing summer-flowering subjects that are over or have been destroyed by frost; at the same time, it is a mistake to indulge in a too drastic cleaning up, for the stems of many herbaceous plants prove attractive for a long time and help to give a furnished appearance to the border. Where it is necessary to replant the herbaceous collection the work should be done towards the end of October or in the beginning of November, as it is a great advantage to get replanting done early, while the soil is still warm. Early planting enables the plants to become established quickly and they are then in a better condition to withstand spells of dry weather the following season. When replanting herbaceous collections it must be borne in mind that some plants, such as Paeonies and *Anemone japonica* and its varieties, resent frequent disturbance; such plants should

therefore only be transplanted when this is really necessary. *Anemone japonica* and its varieties may be increased by means of the underground root stocks, which may be cut into small pieces and placed in boxes of sandy soil, or in beds out-of-doors. Some plants, such as Delphiniums and the many varieties of *Chrysanthemum* (*Pyrethrum*) *roseum* are best moved during the spring, when they are commencing to make fresh growth. When dividing herbaceous plants the strong outside portions of the clumps should be selected for replanting; in the case of strong-growing subjects like *Heleniums* and *Asters*, portions with only three or four shoots are quite large enough to use as they will not need to be thinned the following spring—a few strong stems will give better results than a mass of weak, over-crowded shoots. Needless to say, when replanting herbaceous borders the ground should be thoroughly trenched and manured.

FIG. 135.—A LISU "TABOO" ON HIS SPECIAL PIECE OF FIREWOOD.
(see p. 310).

Cannas.—The Cannas that have been used for summer bedding should—as they are lifted—have their stems partly cut back before they are stored for the winter; they may be safely wintered in sheds, or under the staging in a cold greenhouse, or they may be laid in ashes or leaves at the foot of a warm wall. They should, however, never be stored dry for any length of time as under such conditions they usually prove difficult to start during the spring, whereas when kept moderately moist they turn out fresh and plump and start into growth very readily.

Specimen Plants.—Large plants in big pots and tubs, including such popular subjects as *Agaves*, *Agapanthus* and *Hydrangeas*, that have been used during the summer months for furnishing vases and terraces, should now be placed

under cover, preferably in a cold greenhouse, although in many cases they may be stored safely in dry, frost-proof sheds.

FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF AILSA, Culzean Castle, Maybole, Ayrshire.

Raspberries and Loganberries.—The old canes that have carried the current season's crop of fruits should be cut down close to the ground level and a selection made of the young canes to be tied into position. Various methods are employed throughout the country in tying up both Raspberries and Loganberries, and the main idea underlying most of these methods is to allow the fruiting canes room to develop the side-shoots on which the fruits are borne, while at the same time providing space for the young canes which are to carry the following season's crop. To secure this end, one of the best methods is a V-shaped trellis to which the fruiting canes are secured, and the young growths naturally fill up the centre space as they grow, to be in turn tied outwards when the old ones are removed. Where the Raspberry Borer has been troublesome, the removal of the old canes at the earliest possible moment, and the destruction of them by burning, forms one of the best preventives of future attacks, as the larvae is thus destroyed before it has secured a footing in the young canes. The roots of these fruits should never be disturbed by deep digging; it is sufficient to apply a mulch of manure, leaf-soil, or old compost, and prick this lightly in with a digging fork.

Storing Crops.—Lifting and storing of root crops should now be attended to, and Beet and Carrots for winter supplies carefully placed in layers, with plenty of sand between. The latter are sometimes difficult to keep if placed in very large clamps, and should therefore be stored in long, narrow ones. Large Onions are often amongst the most difficult crops to ripen and keep sound, and they should be tied in twos or threes, according to size, and slung over poles, preferably under the cover of an open-fronted shed, where a constant circulation of air is always passing among them, and where they may be readily examined from time to time; avoid rough handling, which would bruise them, and by setting up decay in the outer layers, prevent the Onions from keeping in good condition. When thoroughly ripened in this way, the tops will soon dry and the bulbs may then be stored by laying them out in any well-aired shed, where they should remain fit for use for a considerable time.

Digging and Trenching.—So soon as the ground is cleared of crops, a rough plan of next year's cropping should be made, and the different areas prepared, adding or withholding manure, as required. Thus ground that has been well-manured the previous season for such crops as Peas, Cauliflowers, etc., may with advantage be trenched or double-dug without adding fresh manure, in preparation for such crops as Potatoes, Beet, Parsnips, etc., while the sites occupied by these root crops in the current season may be well manured and prepared for the more exacting crops. In all cases, where time permits, it is advisable to turn the soil over at least two spits deep, and break up the sub-soil, as by doing so a deeper root-run is provided, and even in a wet season ground that has been thus deeply moved does not readily become water-logged and sour. Another advantage is that annual weeds are buried deeply.

Cauliflowers and Lettuces.—Plants raised from the sowings made in August are now ready to be transferred to boxes or frames for protection during the winter; these should be planted firmly in rather poor soil, especially Cauliflowers, and plenty of air admitted at all times, except during hard frost, in order to keep the plants short and sturdy. When sufficient have been thus secured, the remainder should be thinned out and left standing in the seed-bed, dusting the ground occasionally with lime where slugs are troublesome; in many cases these plants will survive the winter, and prove useful for additional supplies in spring time.

ORCHID NOTES AND GLEANINGS.

EPIPHRONITIS VEITCHII.

THIS useful, pretty, and bright scarlet, bigeneric hybrid between *Sophranitis grandiflora* and *Epidendrum radicans* is not one of the best growers with many, whilst with others it makes a fine specimen and produces large heads of beautiful flowers. When seen in the best condition, it is a most delightful plant and worthy of all care and attention. The chief difficulty is to find a position that exactly suits its requirements; it succeeds in a somewhat humid position in the cool, intermediate house, where it may be syringed or sprayed frequently to prevent attacks of thrips.

Constant propagation is the only means of maintaining a healthy stock of this and other rare and difficult Orchids, as young plants are more vigorous than older ones. *E. Veitchii* is constantly producing shoots from the old stems, and by the continued making up of young plants from this source, and the division of the older plants, a good stock may easily be maintained. It is best to overhaul the plants thoroughly when repotting them. Shake away all the old compost and cut back the old, rootless stems to the living roots. The compost should consist of a mixture of peat, A.1 fibre and Sphagnum-moss in equal parts, and the material should be placed in the receptacles rather firmly. This Orchid is best grown in small, well-drained pots or pans stood on a damp surface, when overhead syringings will generally be sufficient to maintain it in healthy condition.

Many growers attempt to cultivate *E. Veitchii* in too much warmth, yet it is one of those plants which delights in an even temperature the whole year round, and when placed in unsuitable quarters soon becomes infested with insect pests, which do irreparable harm. At no season should this Orchid be subjected to a dry treatment, but much less moisture will suffice during the winter than during its growing season. The plants, after repotting them, should be examined from time to time to see that none is suffering for want of water at the roots, as if the latter are allowed to become dry for any considerable length of time they may shrivel and die. When grown in a close, moist atmosphere, especially during the winter, *E. Veitchii* is liable to attacks of black spot disease, hence, the necessity of careful attention at all times. *J. T. B.*

TWO NEW CYPRIPEDIUMS.

WE have received flowers of two charming hybrid *Cypripediums* from Mr. F. C. Puddle, gardener to Lady Aberconway, Bodnant, Taly-Cafn, North Wales, where they were raised:

C. CYRESTIS (*C. Psyche* × *C. Golden Fleece*).—A very beautiful hybrid with large, white flowers that are very faintly dusted with purple specks on the wavy petals, but have heavier, though still small, spottings of purple over the centre and base of the dorsal sepal. The lip is white with a few minute purple dots and the staminode is pale creamy-yellow.

C. Psyche was obtained by crossing *C. bellatulum* with *C. niveum*, while *C. Golden Fleece* derives from *C. insigne* *Sanderæ* and *C. Antinous*. The last named hybrid is the result of crossing *C. Actæus* with *C. J. Howes*.

C. ERONIA (*C. Duchess* var. *Marica* × *C. Chas. Puddle*).—This is a fine, large flower with yellowish-green petals that shade to almost white at the tips and have deeper green veinings. The white dorsal sepal has a small green basal area, and on this, and also extending a little into the white portion, there are purple spots. The lower part of the dorsal sepal is somewhat contracted, otherwise the flower would be a very fine one. The lip is green and purplish-brown, betraying in its form and colour descent from *C. villosum*.

One parent, *C. Duchess* var. *Marica* is derived from *C. aureum* var. *Surprise* and *C. insigne* *Sanderæ*, and it is through *C. aureum* var. *Surprise* that *C. Eronia* obtains its obvious *villosum* characters, as that hybrid was produced by crossing *C. nitens* *Sallieri* *Hyeaenum* with *C. Spicerianum*, and the parentage of *C. nitens* is *C. insigne* × *C. villosum*.

It is always interesting to notice, as in this case, how the characters of certain species persist through several generations of hybrids.

INDOOR PLANTS.

NEPENTHES.

THE *Nepenthes* or Pitcher Plants are not difficult to cultivate, and well-grown specimens suspended from the roof-rafters of plant stoves are among the most attractive occupants of the houses.

They may be raised from seeds sown on the moistened surface of a mixture of fibrous peat and Sphagnum-moss in a well-drained pan, covered with a bell-glass, and placed in a moist frame. The seeds should be germinated in a temperature from 80° to 85°. If the compost is kept moist without dislodging the seeds, the latter will germinate in about a month from the time of sowing. After several leaves appear, transfer the seedlings to small pots or pans about one inch apart. When strong enough, place them singly in small sixty-sized pots, and when large enough transfer them to baskets, adding two parts turfy loam to the above compost.

Cuttings of one-year-old growths of *Nepenthes* produce roots freely, and established plants may be had in a comparatively short time. Invert small sixty-sized pots on a warm damp bed of fibre, and press the rims of the receptacles slightly down in it. The lower ends of the cuttings, divested of leaves, should be pressed through the apertures of the pots down to the fibre, and the warm, moist air will cause roots to develop from the stems. When well-rooted, the cuttings should be potted, preparatory to establishing them in baskets, for producing bold, healthy leaves with their wonderful marbled pitchers—which constitute the beauty of the plants. The flowers are not without interest, and some may be retained for the production of seeds.

For promoting full growth, a porous, yet somewhat more substantial compost than previously advised should be employed. A suitable mixture consists of two parts each of fibrous loam and peat and one part Sphagnum-moss, with the addition of a little broken charcoal and sharp sand. The plants thrive in a warm, moist atmosphere, and should be shaded from the sun when necessary. From March to September copious supplies of tepid water are required for keeping the material in the baskets moist, though it must not be made sour by an excess of moisture. Syringing is usually necessary twice a day during the summer, reducing the moisture, both at the roots and in the atmosphere, on the approach of autumn, and still more during the winter.

Established plants should be re-basketed in February or March; remove all the old, sour soil, and substitute new compost of the kind already recommended. *H. S. Patton.*

HARDY FLOWER BORDER.

ERYNGIUM GIGANTEUM.

ALTHOUGH the name of *giganteum* might almost induce the reader to suppose that *Eryngium giganteum* is the "giant" of the family, it is not so. Some species, such as *E. pandanifolium*, are taller, but it is still a large and handsome Sea Holly. It is an excellent border plant, although not nearly so much seen as it ought to be. This is probably largely due to the fact that it is a biennial, while the vast majority of the Sea Hollies are perennials. This, of course, means that it dies after flowering, and it is necessary to sow seeds annually if it is desired to maintain the succession. Yet it is quite a good plant, and worthy of the trouble it involves, and it is very distinct in its way from the greater number of the *Eryngiums* commonly cultivated. It grows about three feet in height, and has the bold foliage common to most of the Sea Hollies; the involucre is of a distinct ivory-white shade. It is not difficult to raise from seeds, which are sold by some seedsmen, but it is necessary to warn the purchaser not to be disappointed to find that only a proportion of the seeds will germinate, as many are infertile. They should be sown under glass in spring, the seedlings

pricked out, so soon as fit to handle, into boxes at a distance of about three inches apart, and planted out in July. With reasonable care they will flower the following year. *S. Arnott.*

CAMPANULA PERSICIFOLIA.

OF the Bell Flowers, *Campanula persicifolia* and its many varieties are probably the most valuable from the point of view of utility.

They are of the easiest culture and suitable for massing in separate beds, or for grouping in borders. They also respond readily to pot cultivation and are particularly adapted to room and conservatory decoration.

The flower spikes, which in the newer varieties, grow from four feet to five feet high, present a wonderful display of dainty blossoms ranging through the most delicate shades of palest blue to violet and white. For supplying cut blooms, this *Campanula* is of exceptional merit, and at least one market grower close to London finds it worth while to grow the well-known variety *Telham Beauty* by the thousand under field conditions.

Although these plants are so adaptable, and will grow almost anywhere, they naturally thrive best when afforded a deep, well-cultivated loam in a sunny position, and respond readily to annual top-dressings of stable manure.

Frequent division of the roots is necessary to keep up the vitality of the stock, and by this means a plentiful supply of young plants may be obtained each autumn.

When the varieties *Telham Beauty* and *Fleur de Neige* were introduced a few years ago, they represented a great advance on the type, yet several well-known hybridists have succeeded in evolving a new race far in advance of even these two excellent varieties.

The following sorts were noted during the past summer as being particularly fine:—*Queen of June*, tall and rigid in growth, producing dozens of pure white bells; *Fairie Queen*, a dainty variety with large, greyish bells; and *Everest*, with soft blue flowers produced on much-branched spikes.

There are also one or two "cup-and-saucer" varieties which are exceedingly attractive, and of these I would strongly recommend *The King*, rich deep blue, inclined to violet; and *Crescent*, the purest and most free-flowering white sort. *R. K.*

HELENIUMS.

AMONGST the flowers that add colour to the herbaceous border during autumn, the *Sneeze Worts* take a prominent place. They are vigorous-growing plants, thriving in any ordinary garden soil, and it is evident from the numbers seen in small gardens at the present time, that they are very popular. This is not to be wondered at, as all are excellent for creating fine effects in the garden, or for indoor decoration, as they remain for a considerable period in fresh condition when cut. Like most rampant-growing perennials, it is found advisable to lift and divide the clumps every year, preferably in early autumn, immediately after the flowering period, planting only the strong young parts from the outer edge of the clumps.

Amongst the better known and useful varieties, *H. autumnale* is a showy plant from five to six feet high, producing yellow flowers from August onwards. *H. Riverton Beauty* is also a tall-grower, suitable for the back of the border or for clumps in the shrubbery; this is a rich gold with a brown centre, giving a mass of brilliant colour when the autumn sun shines on it. This and other varieties are particularly fine if a mass of a dark-coloured *Michaelmas Daisy* is planted near them.

H. Riverton Gem is more bronze than the preceding, but is equally as good for garden decoration or for cutting. *H. pumilum magnificum* is a dwarf form suitable for the centre or front of large borders; this grows only from two to three feet high, and is a sheet of gold for many weeks. *H. superbum rubrum* is very like *H. Riverton Beauty* in height and habit, but has flowers of a charming bronze colour. *H. Crimson Beauty* is a variety of more recent introduction and is becoming one of the most popular members of the family. Its habit is all that can be desired for a position in the front of the border or for filling large beds in the flower

garden. This, combined with the attractive bronze-carmine colour and the long period it remains in good condition, makes it a plant that should be planted freely where a good display at a small cost of labour is required. *H. cupreum* will be found to be much the same in habit as the last, but the colour is not so striking, being a dull mahogany.

When planting these Sneezeworts in mixed borders, consideration must be given to the colours of the flowers of the plants that are closely associated with them. *R. F.*

FLOWER GARDEN.

DIMORPHOTHECA ECKLONIS.

THIS South African Daisy differs from the other members of the genus by being of a semi-shrubby nature, its growths, with the exception of the flower-bearing shoots, being woody in texture. *D. fruticosa* is the only species similar to it in this respect, but in this instance only the bases of the stems are woody. *D. Ecklonis* is seldom seen in cultivation, but is very useful for bedding out in sunny positions.

It makes a bushy plant two feet or more in height, its strong, purple-tinted, branching growths being clothed with numerous dark green, sessile leaves. These are from one inch to four inches in length and rather variable in shape, the lower ones being oblanceolate, while those on the flowering shoots are almost linear. The margins are distantly and irregularly toothed and the apex usually acute, though sometimes obtuse. The terminal flower-heads are produced in great profusion, especially during warm, sunny weather, from early July until the autumn frosts arrive. They are three inches in diameter, the rosy florets, numbering about sixteen, being about one-and-a-quarter inch long, pure white on the inner surface and heavily streaked on the outer with deep violet-blue, the small, disk florets being purplish-blue in colour. The flowers do not open during dull weather, though the richly-coloured buds continue to make the plant attractive.

This beautiful *Dimorphotheca* will survive the winter for several years in the warmest parts of the country, but for all practical purposes it is best raised annually from cuttings, which should be inserted in warm cases during late summer, established in a warm house, then wintered in a frost-proof frame, and finally put into flowering quarters at Dahlia-planting time. *D. Ecklonis* sometimes ripens a quantity of seeds which germinate freely and form an extra means of increase. *A. G. F.*

TREES AND SHRUBS.

HYMENANTHERA CRASSIFOLIA.

A NATIVE of New Zealand, from which country it was introduced in 1875, this shrub is a useful plant for use on the rock garden of moderate size. Besides being of interest as a garden plant it is of great interest to the botanist as it belongs to the Natural Order Violaceae.

H. crassifolia forms a low-growing, rounded bush, three feet or more in height and considerably more in diameter, composed of numerous, stiffly-branched and rather flat-growing, light-grey growths which are thickly clothed with numerous, small, semi-persistent leaves, those at the bases of the shoots usually remaining throughout the winter. These leaves are obovate in shape, have entire margins, and are either rounded or minutely notched at the apex. They are about half-an-inch in length, rather thick in texture and rich glossy green. The flowers are produced singly or in clusters of two or three, on short stalks, from the axils of the leaves; they are insignificant, but are followed by a host of small, round, white berries, some of which are sometimes blotched with purple; these fruits are very attractive during autumn and early winter.

H. crassifolia is quite hardy and succeeds in a sunny position in loamy soil, while it may be propagated either from seeds or cuttings. *A. G. F.*

BULB GARDEN.

THE FUTURE OF THE COLCHICUM.

IT is evident that there has been within recent years a much higher appreciation of the value of the autumn-flowering Colchicums, or Meadow Saffrons, for the garden. The old *C. autumnale*, which is wonderfully attractive in masses in grass, has been cast into the shade by such species as *C. speciosum* in several varieties, *C. Bornmuelleri*, *C. giganteum*, *C. Decaisnei* (Fig. 136) and others. And now there is offered in the Dutch market a series of named Colchicums, apparently the pioneers of a small army of Meadow Saffrons of what will, doubtless, be superior to existing forms. This development will be viewed with mixed feelings by those who admire the Colchicum, but who will be dismayed to think of the task they may have to encounter in keeping pace with the novelties. With numbers of other flowers the gardener, unless he makes a speciality of a few kinds of plants, has to consider his desire to keep his collection of the improved varieties as hopeless and beyond

if seedlings or selected varieties from the several species) could be stated. Somewhere about a dozen varieties are offered under such names as President Coolidge, Rubens, General Grant and Lilac Queen, and some are credited with an Award of Merit, probably from the Dutch Bulb-Growers' Association. My excuse for this note is that of a life-long interest in the Colchicum and its value in the garden.

Since writing the above, I have been given to understand that the new Colchicums have been obtained by crossing *C. Bornmuelleri* and *C. giganteum* with *C. speciosum* and its white variety. I observe that one British catalogue offers no fewer than sixteen varieties. What appears to be the most distinct is a double variety named Water Lily, which is said to have light lilac-mauve flowers. It will be of interest to see whether the growing taste for the Colchicums is such as to absorb readily so many new varieties in one year. May I be allowed to add a warning to those thinking of planting Colchicums? This is that they should not be planted in grass to which animals have access, as they are poisonous to cattle or other ruminants. *Septuagenarian.*

FIG. 136.—COLCHICUM DECAISNEI.

either his means or his garden's capacity. The Daffodil is a case in point, although an extreme one, as the Colchicum will never become so popular as that incomparable flower, but it may serve as an illustration of my meaning.

If the Daffodil is thought too extreme a case let us turn to the Crocus, a race in which the older and popular varieties which held the field so long have been threatened with exclusion by the improved varieties. Of the latter there are now so many that choice is difficult, and the endeavour to keep up with the times more difficult still. It has been the same with many other flowers, bulbous and non-bulbous, and now the Colchicum is about to present the same problem. I hope it will not be thought that I am opposed to new varieties which are improvements upon old ones. This is not the case, and I am testing a few of the new Colchicums this season, so as to see for myself if they add to the beauty of the garden more than the old species and their few varieties. It would be interesting and also of some value if the origin (as to parentage,

COLCHICUM DAENDELS.

THIS is the first of a group of new hybrid Colchicums, or Meadow Saffrons, to bloom, with me, this season. Its parentage is said to be *C. Bornmuelleri* and *C. speciosum*, and in the lists the colour is stated to be the same as that of *C. Bornmuelleri*. It is a very fine Colchicum and marks an advance in the flowers of the Meadow Saffrons; I am looking forward to some others blooming. The colour on opening is a pale lilac, and the blooms are then a little disappointing. They afterwards increase in size until they outrival the finest forms of *C. speciosum*, and the colour deepens to a bright purple. The plant is tall; the white tube is strong and bears up the flower well instead of falling over in bad weather, as is too common with some of the other Colchicums.

Several flowers are produced in succession from the same corm. Altogether I am more than pleased with *C. Daendels*, and I am satisfied that there is a future before these hybrid Meadow Saffrons. *S. Arnott.*

NOTICE OF BOOKS.

Plants of New Zealand.

THIS is the third edition of Laing and Blackwell's excellent book.* It is not a manual of the New Zealand flora, for it gives botanical details of only some three hundred selected species of certain genera, and these do not include the Mosses, the Ferns, the Grasses or the Sedges. Still less can it be regarded as a horticultural treatise, but it is a book of the greatest interest to those whose horticultural knowledge goes beyond the production of florists' flowers.

The General Introduction is lengthy and varied. For the information of those whose botanical knowledge is meagre, it gives a clear, concise and simple account of the functions of different parts of plants, whilst for the budding botanist it provides a fascinating "Key to Classification," which should provide him with intellectual entertainment far surpassing that of the crossword-puzzle. In it also we are told something of the geographical positions and of the varied climates of New Zealand. There is a general survey of the various plant communities in one of the strangest floras in the world. This is given under the following headings:—(a) The Open Country, with its Grasses and Sedges; (b) The Fern Lands, a special feature of New Zealand; (c) The Bush, with its forest trees, its lianas and its epiphytes; (d) The Scrub, a sort of Heath gone mad; and (e) The Alpine Regions, with Nature's rock gardens.

In this introduction are found disquisitions on the Age, the Origin and the Affinities of this unusual flora, with special reference to its relationship to the floras of Australia and South America, and the theories advanced to account therefore.

Following the introduction are the detailed descriptions of the three hundred selected species, with less formal allusions to many others. In the short botanical descriptions abstruse technical terms frequently give way to simpler English words, and in the case of most species we are given the habitat, the native name, and the settler's name for each. Interspersed with these descriptions are many notes and memoranda bearing on all sorts of subjects connected with the plants under review.

Amongst the subjects thus dealt with are the qualities of different timbers; the difficulty of getting large trees to the saw-mill; the uses and methods of collection of Kauri Gum; the economic uses of various plants; the methods formerly adopted by the Maoris in preparation of various foods from most unpromising materials; old Maori proverbs and legends connected with certain plants; the toxic properties of Coriaria (Tutu), and how good Bishop Harper was nearly poisoned by partaking of Tutu wine made from its berries; the peculiar behaviour of the roots of the Mangrove, in growing upwards out of the mud into the air, and why; the methods of pollination in certain plants; xerophytic plants; the colour (or rather its absence) in the flowers of New Zealand Gentians, Myosotis and Clematis, with theories to explain it; juvenile and adult forms in many species; and so on. There seems no end to the subjects and theories referred to, and all of them fascinating to the enquiring mind.

Special mention must be made of the illustrations in this book. There are 175 photographic reproductions—all of them good and many of them of exceptional excellence. The subjects of these range from open country, forest trees, alpine scenes and individual plants, to leaves, flowers and fruits, some of them given life size.

Many changes from the hitherto accepted nomenclature will be found, some of which will no doubt be distressing to horticulturists and nurserymen. For example, the shrubby Veronica now becomes Hebe; Olearia insignis becomes Pachystegia insignis; Gaya Lyallii is Hoheria Lyallii; Rapanea (Myrsine) Urvillei is Suttonia australis; Calceolaria Sinclairii is Jovanella Sinclairii; Olearia Fosteri is O. paniculata; and Aristotelia racemosa is A. serrata; and so on.

* *Plants of New Zealand*, by R. M. Laing and E. W. Blackwell. Humphrey Milford, Oxford University Press, London. Price 18s. net.

English gardeners who find difficulty in distinguishing the various species of shrubby Veronica (or should we say, Hebe) may find comfort in knowing that the authors speak of their "protean fickleness of form," and after noting the varying views of different botanists as to the actual number of distinct species, they say "there is no possibility of fixing definite limits to the species by morphological methods of the ordinary systematist."

One cannot be expected to agree with everything in any book, and this one is no exception. On page 190, I find Pittosperaceae called "The Matipo Family," though a few lines further on we are told that the application of the name 'Matipo' to Pittosporum is a misnomer, as that is the native name for a species of Suttonia. Why, then, should the authors have perpetrated the very error that they are condemning in others?

Then, on page 233, Hibiscus diversifolius is described as an annual. The *Manual of New Zealand Flora* gives it as a perennial, and that is correct. As proof of this, I enclose a photograph taken this year from a plant that has already flowered well in each of the last three years (Fig. 000). Again, on page 288, it is stated that the aerial roots of Metrosideros tomentosa "do not reach the ground." One is constrained to quote W. S. Gilbert, "'What, never?' 'Well, hardly ever.'" for at Tresco Abbey these may be seen having taken a very firm hold of the ground beneath the tree. And on page 388 the small shrub, Hebe (Veronica) Lavandiana, is described as a herb.

The Glossary at the end of the book is inadequate; for, although throughout the book technical terms have been used so little as possible, their complete avoidance could not be expected; and several of those used do not appear in the Glossary. In the very first test I made I failed to find "xerophyte" though this had been alluded to eight times in the body of the book. These, however, are small matters, and detract but little from the excellence of this most readable and informative volume. Its perusal has given me great pleasure and much instruction. Its discursive informality is one of its great charms. It is so full of varied and interesting matter. The authors are not unnecessarily dogmatic; they usually give both sides of a controversial question; and they have avoided, so far as possible, the classical technicalities so dear to the heart of the botanist, but so troublesome to the uninitiated. This is a book that should be read by all who are interested in New Zealand and its Flora. A. H. Williams.

NOTES FROM A WELSH GARDEN.

COROKIA macrocarpa is a shrub of much distinction, more especially by comparison with the better-known members of its genus, which, though undoubtedly attractive, are not remarkable for beauty of foliage. In this species the leaves are some two or three inches long, and nearly one inch wide; they are very pointed, and while the upper surfaces are a bright glossy green, the underparts are pure white. This handsome foliage, as is the case with most of the shrubby Senecios of similar colouring, never looks so well as it does in autumn and early winter, when the leaves not only expand to their fullest dimensions but develop a stronger, more definite contrast in white and green. The golden, starry flowers and yellow fruits are very much like those of the more familiar species, but they are larger.

Among the more or less prostrate Cotoneasters, C. horizontalis still holds its own as a berry-bearing shrub. There are, however, many forms of this fine old shrub, some being more reliable croppers than others, and they vary very considerably in habit of growth. C. h. perpusilla, for example, which is a flat-growing variety, appears to be represented by two very distinct types, one having smaller leaves and less vigour than the species, while the other has larger foliage and extraordinary robustness. These latter characteristics belong to the form of C. h. perpusilla, which the late Mr. E. C. Buxton claimed to have discovered in his garden some years before the now better-known

one was introduced from Tibet, and as a fruiting variety it is superb.

C. hupehensis I have had for a good many years. It has not grown taller than about five feet. As a flowering shrub it is certainly far ahead of most of its kind, the pure white flower-clusters standing erect on the broad, fan-shaped branches, after the manner of those of Spiraea bracteata. Until this year, C. hupehensis had scarcely fruited at all, but it is now carrying a fair crop, and the crimson berries, large and almost globular, are singularly handsome.

It is an ill wind that blows good to nobody, and the rainy season has been just what some shrubs of this dry woodland bank enjoy. Gaultheria trichophylla is a case in point, this beautiful little plant now ripening its third crop of big blue "berries." Among other so-called peat plants which are thriving in our woodland loam, Vaccinium corymbosum is carrying a bountiful yield of its Grape-blue fruits which will be succeeded by the beautiful autumnal tints for which that species is famed. V. glauco-album is an even choicer member of the genus, an evergreen whose large leaves have white undersides and the jet black fruits a dusting of blue-white bloom. This Himalayan plant seemed a little tender at first, but it is now rarely injured to any extent by frost.

Euonymus latifolius, although not yet half-grown, has been remarkably beautiful, its large, bright, rose-pink and orange fruits hanging in profusion among the broad, fresh green leaves. With the exception of the best forms of our own Spindle Tree (E. europaeus), this is the most ornamental of the genus which I have seen, and it is a vigorous, healthy grower. E. nanus, not much over a foot in height, often fruits well in poor soil on a sunny, rock-garden ledge, and under similar conditions that engaging little, prostrate shrub, Muehlenbeckia axillaris (nana) is now threading its slender strands with its glistening pearls.

Solysa heterophylla, though not fully hardy here, is always a cheerful object at this season, and its bright blue bells swinging at the tips of their hair-like stalks, are exceedingly pretty. A month ago I stated in these columns that Paro chaetus communis promised to do no more than emulate a Clover field of lush flowerless growth, but during the latter part of September it broke into a galaxy of blossom, the mat of vivid green, brown-flecked trefoils—over a yard across—being adorned by hundreds of Pea-flowers in the blue of Gentiana verna. I still think, however, that there are good and inferior forms of this delightful plant, for some other specimens, from different sources, growing close to the above, and in precisely similar conditions, have not yielded a blossom.

Leptodermis pilosa does not do as well here as in the south-west, but its white, tubular flowers, although sparingly borne, are not unwelcome these autumn days. This also applies to Malvastrum phoenicium, which seems to be more susceptible to frost than the foregoing. Its cup-shaped, rather small blossoms of a full crimson are not particularly attractive, but the foliage and habit of the shrub are both good.

When there are limitations to one's space, subjects which need considerable room for natural development have to be carefully considered on their merits. But while I am reluctantly obliged every now and then to remove some in favour of others, the sword of fate has not yet descended upon Spiraea (Sorbaria) arborea, and this is a shrub of such superlative quality that I very much doubt if it ever will. Throughout the later summer this most elegant species bore a long succession of its enormous, cream-white panicles of blossom, but that is not all, for the large and beautiful pinnate leaves which hang from the arching branches with such an easy grace are now assuming the bronze and yellow hues which precede their fall. S. arborea needs considerable space and good living, and for these no shrub makes a more generous return.

The winter-flowering Periwinkle, Vinca difformis, is now approaching its best, its starch-white or very pale blue blossoms deriving some protection from frosts from the branches of the shrubs which over-shadow it. The Chinese Saxifrage Fortunei which has occupied a similar position for many seasons is also coming

into flower. *Geranium Wallichianum* var. E. C. Buxton, if it does not actually prefer a cool and sunless spot, always looks better in shade, full sun tending to give its clear blue petals a purplish tint. Even so, a plant of this useful, late-flowering *Geranium* which is sprawling about between some clumps of *Kniphofia Macowanii*, makes a telling contrast with the soft scarlet of the latter. *G. grandiflorum* is another species which can do with considerable shade, and one of the few which may be relied upon to yield a good crop of autumn flowers. There is an undeniable charm about the fresh clean blue of this fine old Cranesbill, and I know of few better carpeters for growing among shrubs and trees than this. *G. asphodeloides* is a hardy, robust species, making trailing growths a yard long, and if it is cut back so soon as the first flowers are over it will invariably give a good account of itself at this season. The flowers, nearly two inches across, are a bright silver-pink.

Hypericum repens is still flowering profusely in spite of the weather, and another rock garden species of this genus which is always later than most of its class here, is *H. polyphyllum*. Though it has a habit of reflexing its beautiful blue rays, save when the sun is warm, *Felicia rotundifolia* still gives a bit of bright colour in a somewhat rain-saddened rock garden. *Oxalis magellanica* is also flowering freely, and a conspicuous tuft of pale lavender on a high and comparatively, dry position, shows that the lovely *Scabiosa graminifolia*, though a native of the sun-baked limestone of southern Europe, has survived the ordeal of a hopeless summer with commendable fortitude. A. T. Johnson, Ro-Wen, Conway, North Wales.

NOTES FROM WISLEY.

IN addition to several very cold nights a frost has affected my own Dahlias. I was pleasantly relieved, therefore, to find that the trials of this flower at Wisley were quite unaffected, even although October was well advanced. There was as good a show of Dahlias at the gardens on October 8 as there has ever been this year. A feature of the Dahlia trials this year has been the excellent display made by the Mignons, which commenced to bloom so early as July. No new awards were made to members of this section, but a number of varieties were Highly Commended, including Coltness Yellow, Coltness Salmon and the bright, crimson-flowered Harold. Many new awards, however, have been made to varieties belonging to the Decorative section, among which are the Rev. M. Herbert Lee, with handsome blooms of bright magenta; and W. D. Cartwright, with large yellow flowers which have a darker centre, and which are rather similar to those of Berengaria. A very free-flowering variety with buff-pink flowers is well-named Freedom, while another attractive Decorative sort is J. L. Crowther, the colour of which is not easy to describe as it betrays tinges of buff and smoke grey in addition to the pink ground. In the small-flowered Paeony section Mrs. J. Goddard, bearing large numbers of scarlet blooms, and the no less floriferous Elma D. Cook, with yellow flowers, suffused with white, were among other good varieties that received an Award of Merit.

Among the Dahlias which have received awards in previous years, and which form the bulk of the collection at Wisley, an outstanding variety is Jersey Beauty which is one of the best, if not the very best, deep pink-flowered Dahlias. The pink flowers of Secretary Voors are also charming, both on account of their colour and their agreeable form. A noteworthy decorative variety with blood-red flowers is Reginald Godfrey, while two excellent yellow-flowered Dahlias are Psyche, a large, Paeony-flowered variety, and Cintra, belonging to the small, Paeony-flowered group. Striking colour is a feature of Rapallo, the petals of which are deep red with a yellow rim and reverse. The latter is of more value for decoration in the house than in the garden, and the form of the flowers might well be improved.

The wet season has been very favourable to the growth of the commercial fruit trials of Apples, Pears and Plums. The majority of

the trees are now from three to four years old, and some of those on dwarfing stocks have already commenced to fruit and to show promise of commercial value.

The fruit crop, as a whole, has been very satisfactory this year at Wisley. Apples have borne well and as a result of the exceptional amount of rain the size of the fruits has been much above the normal. Some, in fact, have been quite out of character on this account. Pears have been irregular and Plums poor, but good growth has been made, and if we have a favourable season next year an extremely heavy crop should result.

Exceptionally fine crops of bush fruits were produced, and the Black Currants were some of the best ever seen at Wisley.

The new building for storing and exhibiting fruits is now finished and has a most attractive

flowers of *Senecio clivorum*, and its bold leaves, show up particularly well against the muddy water.

A seldom-noticed plant on the pond bank, possibly because of its low stature, is *Betula nana*, the Dwarf Birch. It rarely exceeds two feet in height and occurs in many hills in the Highlands of Scotland. It is also found in Lapland, where it is of considerable economic importance.

In the wild garden there has been a fine display of hardy Cyclamen, and quite a large area has been covered with their flowers since the beginning of September. Their foliage is now pushing through the ground, most of which is most attractively marbled. The corms, which were planted just over a year ago are very large, and in some cases measure nine inches in diameter. Blooms of Colchicums, such as *C. speciosum*, *C. s. album* and the rosy-flowered

FIG. 137.—THE LOHIT VALLEY: DRY REGION, WITH *PINUS EXCELSA*. (see p. 309).

appearance. About fifty varieties of Apples, including good specimens of Margil, Dr. Clifford and Peasgood's Nonesuch, and such Pears as Brockworth Park—of which there has been a fine crop—are now in view. Fruits in quantity are also temporarily stored in the spacious loft under the roof of the building.

The heavy rains have stirred up the ponds and the water has become very muddy. This, however, has served to enhance the brilliance of red-foliaged plants by the water-side, which are most conspicuous in contrast. One of the most striking plants is *Rhus cotinoides*, which is even better than the very bright red-leaved *Rhus Cotinus atro-purpurea*. Other foliage around the ponds, which the hand of autumn has enlivened, includes that of *Cornus sanguinea alba* and *Nyssa sylvatica*, which also belongs to the Dogwood family. It is a native of North America and makes a handsome tree. In addition to autumn foliage, the deep yellow

C. cilicicum are also very welcome at a time when flowers in the wild garden are scarce.

The trial of Daffodils is still being carried on and new varieties have been received from growers so far distant as Canada. Before planting, all the bulbs are thoroughly sterilised.

The herbaceous borders are now past their best and many plants have gone to seed. Among them are *Sedum spectabile* and *Bocconia cordata*. Both these plants, however, are almost, if not quite, as attractive in their present stage as, when in flower. Many good groups of Asters, both of the Novi-Belgii and the Amellis sections, are to be seen, while Japanese Anemones and late-flowering Monks-hoods—such as *Aconitum Wilsoni* and the much dwarfier *Fischeri*—lend colour to the scene.

The laboratory staff at Wisley has now been augmented by Mr. Tincker, who has taken up his position as Keeper of the Laboratory. J. E. Grant White.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the **PUBLISHER, 5, Tavistock Street, Covent Garden, W.C. 2.**

Illustrations.—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Urgent Communications.—If sent by telegraph, these should be addressed "Gard. Chron.," Rand; or by telephone, to Gerrard, 1543.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Letters for Publication as well as specimens of plants for naming, should be addressed to the **EDITORS, 5, Tavistock Street, Covent Garden, London.** Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

Editors and Publisher.—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the **PUBLISHER**; and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the **EDITORS**. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers.

INTERNATIONAL HORTICULTURAL CONGRESS IN VIENNA

IN order to mark the one hundredth anniversary of the establishment of the National Horticultural Society of Austria (Osterreichische Gartenbaugesellschaft), a great International Horticultural Congress was arranged and took place in Vienna from September 19 to September 25 last. Various countries and great horticultural societies were invited to send representatives to read papers at the Conferences and take part in the discussions, and in all some four-hundred members attended the meetings from at least twenty different countries, including most European countries, the United States of America, Canada, Japan, Egypt and the Argentine. The British Government was represented by Mr. H. V. Taylor, the Royal Horticultural Society by the Society's Botanist, Dr. A. B. Rendle; by the Director of Wisley, Mr. F. J. Chittenden, and by Mr. G. W. Leak, Member of Council; while Mr. B. H. Rendle and Messrs. C. Engelmann and W. Treseder, well-known nurserymen, were also in attendance.

A large number of subjects relating to horticulture were brought before the Congress, which was under the presidency of Professor Dr. Wettstein of the University of Vienna, and Herr Rottenberger; Dr. Bretschneider and Herr Kratochwilje being general Secretaries, with the assistance of Professor Dr. Sirks and Messrs. Camillo Schneider and A. Vollbracht. Every morning was fully occupied by the papers which dealt with the Nomenclature of Garden Plants (papers by M. P. Rivoire of Lyon, Mr. Ernst Krelage of Haarlem, Professor Dr. Suringar of Wageningen, Mr. C. Schneider of Berlin, and Professor Tanaka of Japan); International System of Designating Colours (papers by Dr. Krüger of Dresden and M. P. Rivoire of Lyon); the Award of Certificates to Plants and Registration of Novelties (papers by Mr. T. Macoun of Ottawa, M. P. Rivoire of Lyon, Herr F. Werner of Beuel-am-Rhein; Mr. E. H. Krelage of Haarlem and Herr F. Kratochwilje of Vienna); Interchange of Gardeners between Countries (papers by Herr J. Furedi, Budapest; Herr W. Danhård of Dresden and Herr A. Eipeldauer of Vienna);

Flowering and Fertility of Fruit Trees (papers by Dr. W. Magnus of Berlin, Dr. F. Kobel of Wadenswyl, Herr K. Limbacher of Budapest, and Dr. F. Passecker of Vienna); Transpiration (papers by Professor Dr. Zederbauer and Dr. Buchinger of Vienna, and Dr. Eibl of Klosterneuberg); The Formation of an International Horticultural Bureau (papers by Dr. Sirks, Mr. H. V. Taylor of London, and Herr F. Szasz of Budapest); Public Gardening (papers by Herr H. Kube of Hanover, and Herr F. Szasz of Budapest); Garden Architects (papers by Herr R. Kempkes of Berlin, and Herr W. Schmidt of Vienna); The Laws of Heredity Applied to Practical Horticulture (papers by Herr M. Becker-Dillingen, Elstertrebrutz;

tional Institutions, Colour Designation in relation to Flowers, Nursery Work, Fruit-growing Research, Certification of Plants, and so on. These Committees will report to the next Congress in London in 1930, and efforts will be made to direct energies towards desirable ends and by the full interchange of information and ideas to avoid unnecessary duplication of work.

The main meetings of the Congress were held in the magnificent buildings of the University of Vienna, being opened by Professor Wettstein, the Director of the Botanical Gardens and Institute of the University; these occupied every morning of the Conference. The afternoons were taken up by visits to famous gardens and places in the

FIG. 138.—THE LOHIT VALLEY, BY RIMA.

Dr. Tschermak-Seyemsegg of Vienna, Dr. J. de Vilmorin of Paris, Mr. F. J. Chittenden of Wisley, and Dr. F. Frimmel of Eisgrub); Nursery Practice (papers by F. Langenecker, of Schöllschitz; Herr O. Schindler of Pillnitz; Mr. J. Versely of Molitorov; Herr E. Maurer of Berlin; and Mr. O. Tounner of Ybbs); Horticultural Experiments in Schools (papers by Herr W. Lauche, of Eisgrub; Dr. W. Gleisburg; Dr. A. M. Sprenger, Dr. Ballenegger, and Herr O. Schindler, Pillnitz).

A few other subjects were also dealt with, and some were crowded out, but it will be seen that a very wide range of subjects was before the Conference, and much useful information brought together.

Probably the most useful work done was in the establishment of seven international committees, each charged with the duty of bringing together the views of the different countries upon their several subjects, such as Nomenclature, Interchange of Plants between Educa-

environs of Vienna, including the magnificent palace and pleasure grounds of Schönbrunn, the garden of Mons. A. de Rothschild, with its fine trees and shrubs and magnificent view of Vienna and the Danube, its great range of houses for forced fruits of all kinds, Orchids and other flowers, all well cultivated, and its well-furnished fruit and vegetable quarters without any waste space; the Belvedere and other public gardens; the Botanical Gardens of the University, where are some fine trees, especially of Ginkgo biloba and Platanus orientalis, and excellent collections of Succulents, both in the houses and in the frame yards, all within a relatively small area; to various nurseries; to Baden, with its famous sulphur springs; to the great new tenement houses (where window boxes were conspicuous and well-tended); to the Prater, the great recreation ground and pleasure park of Vienna, with its pleasing woods and magnificent avenues; to Klosterneuburg, with its great and magnifi-

cent church and old buildings perched upon an outstanding hill near to one of the greatest of Austria's experimental horticultural establishments; and (on the final Sunday) to the Hochschneeberg (6,450 feet) with its natural rock garden above the limit of the forests of *Pinus austriaca*, *P. sylvestris* and *Picea excelsa*, and partly above even the prostrate *Pinus montana*. Even yet there were mats of *Primula minima* still in flower, and plentiful blossoms of some of the *Campanulas*, *Gentiana austriaca*, *G. ciliata* and *G. asclepiadea*, *Ranunculus alpestris*, *Arabis*, and so on, but the bulk of the flowers was past, and only the mental vision could picture the wealth of flowers in July when the *Rhododendrons*, *Rhodothamnus*, *Primula clusiana*, the *Saxifragas*, *Dianthi*, *Tunica*, and a host of others which grow there are in their beauty.

Fortunately, and in contrast to the weather at home, bright sun, except at Baden, accompanied the whole of these functions, and delightful summer weather helped to make the visits pleasant as well as profitable.

In the evenings the representatives attending the Conference were received and entertained by the Austrian Horticultural Society in the rooms of the Society; by the President of the Republic in the Foreign Office; by the Burgo-master of Vienna in the Rathaus; by the Minister for Agriculture at the Ministry; and by the Hungarian Minister at the Embassy.

The arrangements for the Conference, excursions and receptions are worthy of all praise, and reflect the greatest credit upon the organisers. A high standard has been set for British horticulture to emulate at the International Horticultural Congress which is to take place in London in July or early August, 1930, when many of the questions raised at this Congress will come up for further discussion before what is hoped will be no less representative a gathering than that which assembled in Vienna.

MR. F. KINGDON WARD'S NINTH EXPEDITION IN ASIA.*

XVII.—THE LOHIT VALLEY.

WE made an early start on July 16, and in two hours emerged from the forest, high above the torrent, on to a steep, rocky slope covered with thin Pine forest. Ahead of us we could see the Lohit Valley, but not the river. A long and rather difficult traverse across the face followed until finally we reached a high rocky spur, overlooking the Lohit itself, whence we could make out the small village of Kahao in the distance; we must have been fully 2,000 feet above the river then. On the dry Pine and Bracken-clad slopes (Fig. 137) were a number of more or less interesting flowers—ground Orchids (*Spiranthus*, etc.), *Lilium taliense*, *Campanula colorata*, *Didissandra lanuginosa*, *Polygonum capitatum*, *Sedums* and various *Leguminosae*, especially twining herbaceous species. There were also a few shrubs (*Pieris*, *Desmodium*, *Sophora*) and small Alders; but mostly the very steep rock-bound slopes were clothed with Pine (*P. excelsa*), and so, too, was the valley below, so far as the eye could range. We scampered down a thousand feet of rock to a large platform, clearly an old river terrace, from where we could see the river, still far below, on either side (Fig. 138), northwards to Rima, just out of sight behind the next shoulder, and southwards to the Mishmi Hills. The Lohit is a pretty big river—it gave me the impression of being considerably larger than the Nam Tamai—and was the colour of Lentil soup; turbulent and swift.

From this platform we turned southwards, that is, down stream, descended another thousand feet, crossed the Di Chu by a flimsy bridge, near its junction with the Lohit, and an hour later reached Kahao via cultivated

fields and lanes, which were for the most part irrigation channels. We had descended about 3,000 feet, and covered about six miles in eight hours. The day had been fine, though overcast, especially in the afternoon, and no sooner did we reach Kahao than it began to rain smartly. My tent was pitched in a fallow field alongside the village, and the men rigged a shelter for themselves hard by. I had been badly bitten by blister-flies all day, and down here we were plagued all night by mosquitos and sand-flies. The next night I slept beneath a sand-fly net. Scarcely had we taken up our quarters when a party of Mishmis hove in sight, marching in single file, and all smoking their quaint pipes; of course, they halted to gaze at us, and it is a curious

On the following day my six Tibetan coolies deserted, and as no more were available at Kahao to replace them, we had to stay at Kahao for several days, while beating them up from elsewhere.

The Lohit Valley was, indeed, different from anything I had expected. Though our altitude was only about 4,000 feet, the same as the Nam Tamai, yet the country was open and rocky, covered with scattered Pines; and except around villages and in deep sheltered glens, these were the only trees! Higher up the valley, by Rima, even these dwindled almost to vanishing point, and it was only too evident that we were, despite our low altitude, on the fringe of the plateau. The climate, of

FIG. 139.—RHODODENDRON SP. § MADDENII (K.W. 7136).

fact that the only Mishmi I met, either now or in the winter when we returned to the Lohit, who spoke Hindustani, was amongst them. Seeing me, and naturally taking me for a government official—the only kind of white man he had even seen or heard of—he asked me if I spoke 'Assam talk' as he called it, whereupon I asked him if he knew the Political Officer in Sadiya, and enquired about the road; and the answers he gave proved remarkably accurate. He told me it was fifteen marches to Sadiya, so that, even in my camp on the other side of the pass, I was considerably nearer to rail head in Assam than Burma. A few days later, when we were leaving, I wrote a note to the Political Officer, Sadiya, gave it to a villager, and instructed him to pass it on to the next village, and so on down the valley from village to village until it reached the plains; and it actually reached its destination in forty-two days, enabling the officer to send a reply, which I received when we arrived in Kahao, on November 11.

course, was in violent contrast to that of the Nam Tamai—as we soon discovered. The very next day (July 17) though the valley was full of the familiar clouds when we woke, the clouds soon dispersed, the sun shone out, and the temperature leaped up to 90°. About midday a terrific wind sprang up without warning and blew with savage force till after dark, uprooting my tent; and we found that this wind, blowing up from the Assam plain, was an almost daily phenomenon, summer and winter, though most of the moisture had been robbed from it before it reached us. This accounted for the lack of trees. Little rain fell, but usually, when a lull followed a few days of storm, a drizzle set in. I noticed hardly any dew, though on clear nights we had sharp frosts in November. Thus the climate was quite like that of the lower valleys on the Tibetan plateau, and, indeed, even in July we could look northwards up the Lohit day after day and see the turquoise sky which roofs the roof of the world. I was astonished to find such a comparatively pleasant

* The previous articles on Mr. Kingdon Ward's Ninth Expedition in Asia were published in our issues of August 14, 28, October 9 and November 20, 1926, and January 1, February 19, March 5, 19, April 9, 30, June 4, 18, July 30, August 20, September 10, and October 1, 1927.

climate so close to the plains of Assam—eighty miles distant as the crow flies!

Of course, it was not really at all pleasant here; it was merely a change from the perpetual wetness of the Seinghku. Had we ascended the Lohit Valley for a couple of marches, and then climbed to 10,000 feet on the plateau, it would have been ideal, but the wisdom of doing that was doubtful, even had it been practicable. The days were hot and stuffy; the wind tore us badly and then flayed our nerves raw. Insects were rife—all blood-thirsty; at night the temperature fell only a few degrees below 70° (it sometimes reached nearly 100° in the afternoon) and exhaustion made sleep difficult. I made daily excursions after plants, and found a number of bushes and shrubs along the stream banks, including the following:—a Rose, with white flowers and small, globular, smooth, yellow fruits; *Ceratostigma Griffithii*, with ravishing blue flowers—it seems, like Gorse, to have flower on it always; several species of *Rubus*; species of *Buddleia*, *Ligustrum*, *Clematis*, *Vitis*, *Elaeagnus*, *Philadelphus*; also Ivy and shrubby *Labiatae* and *Compositae*.

Around the village were a few fruit and other trees, such as *Salix*, Alder, Peach, Walnut, Quince and Citrus, and I gathered in flower from the stream bed and the Rice fields a species of *Impatiens* (flowers crushed—Strawberry colour), *Strobilanthes*, *Potentilla*, *Epilobium*, *Senecio*, etc.—nothing very startling.

Undoubtedly the valley suffered from drought at certain seasons, and from wind (which has the same effect) always; consequently, the flora was a more or less xerophytic one. It could hardly have been chance that the under-leaf surface of a great variety of plants wore a protective covering, either of hairs or of wax. For example, three species of *Rubus*, two *Compositae* (*Artemisia*), *Plectranthus*, *Philadelphus*, *Potentilla*, *Anemone*, *Buddleia*, and one or two other plants, have the leaves quite white beneath, either due to long, silky hairs, or to a woven mat of interlocking hairs; *Quercus* and *Salix* were furnished with a film of wax, and *Clematis* with a short, close pile; and *Bracken*, *Verbascum* and *Didissandra lanuginosa*, were well coated with yellow hairs instead of the more usual white ones. Such trees and shrubs as can stand the racket are of that peculiarly dull lustreless grey-green which one associates with desert conditions; like the Date Palm and *Casuarina*, the graceful *Pinus longifolia*, which was not rare in the Nam Tamai and lower Seinghku valleys, was absent here, replaced by the glum *P. excelsa*, interesting because in many open spaces in the valley, particularly long-abandoned cultivation, young trees obviously self-sown, were springing up by the hundred.

I collected a few cosmopolitan weeds in the Paddy fields, and a few *Leguminosae* on the heat-stricken slopes above, and that was about all the direct addition to my collections in the Lohit Valley; but the valuable discovery that the dry zone was within easy march of Sadiya, and that with a little organisation one might get through the difficult Mishmi hills into the clearer field of action beyond was worth the trouble three times over.

By July 21, the missing porters had been replaced, and on the 22nd we started on the long ascent to the Diphuk La, with Nung, Tibetan, and Lisu coolies; these latter were a great acquisition (although I was saddled with two girls), because the Lisus are about the stoutest tribe on the frontier, and when in November we had a general strike, this labour stood firm. Unfortunately, there were very few of them, as they belong rightly to the China side, a long way east of where we were (see Fig. 135, p. 303).

We did practically the same marches returning as coming, and found ourselves back at the hot spring on the 24th. Of course, I noticed a number of different plants which had been missed on the way down, foremost amongst which were a big tree 'Thomsoni' *Rhododendron*, with polished, tawny-purple trunk and large, glossy leaves, the petiole and midrib conspicuously red (K.W. 7125), and a small straggling 'Maddeni,' which lurked beneath the bushes in rather swampy ground. The former was pretty common in one locality, where it was a feature of the forest, but its area was strictly confined, and I saw it nowhere else; of the latter,

I could only find three specimens (K.W. 7171). There was also *R. vaccinioides*, and I found the supposed 'Taliense' (K.W. 7124) had crimson flowers, and suspect the identification. The big 'Maddeni' was still in gorgeous bloom, with many buds still to open; flowers snow-white with orange-red anthers, fragrant, in trusses of four to six.

Arrived at the hot spring, our Lisu warriors looked to their bows, and at dusk departed to ambush a couple of Takin, as we were all on short rations. As usual, the herd came down to take the waters, the hunters shot arrows into them, there was a general stampede, and about midnight everyone returned to camp. Next morning only one dead beast could be found, but as it was certain that another had been hit, the men asked leave to stay in camp that day, and try to track the wounded Takin. Nothing loath, I agreed, and while the men followed the trail (ultimately without result) I went up the sunny scree to look for *Rhododendrons*, which grew in dense thickets and great variety. Amongst the bigger boulders at the foot of the slope, the 'Heliolepis' (K.W. 7108) was flowering profusely; with it a bush 'Campylogynum,' with plum-purple flowers, or tending to crimson on the one hand, or to violet on the other; and impenetrable tangles of a 'Souliei'. Higher up the slope the bushes became much smaller and more scattered—an 'Anthopogon,' and a small, very compressed 'Roxieanum,' but overweighted with flowers—or, rather, fruits—in tight trusses of four to seven, the corolla persisting. The biggest specimens were so much as five feet high, but plants two feet high had flowered generously. Just off the scree, where larger bushes grew with scattered trees of *Larix* and *Abies*, was the much bigger, but obviously allied *R. ixenticum*, which I am told is a poor thing in flower; perhaps my dwarf *R. recurvoides* will prove better value. Higher up on the scree was a small 'Sanguineum,' and on the cliffs, a 'Lepidotum' made domes of colour. More interesting was K.W. 7190, which had all the appearance of being a cross between *R. recurvoides*, and the 'Souliei,' K.W. 7189.

When I got back to camp (having had a delightful bath in the hot spring) the hunters had skinned and chopped up our one Takin, and we all had a good meal. Next day, we resumed our march, the fine weather breaking up as we approached the pass and the source of the Seinghku; so that when we camped on the 27th, just below the glacier lake, steady rain reminded us of what was in store just over the range. We crossed the pass next day in drenching rain, and descended the valley to my 11,000 feet camp. F. Kingdon Ward.

THE HEATH GARDEN.

Few people realise how much pleasure may be derived from a Heath garden—the long-flowering season and, after the initial expense, the small cost of upkeep, which becomes less each year. Most people, probably, seem to think that a Heath garden will give them about three, possibly four, months of colour in the year, whereas there is a display of some sort for eleven if not twelve months of the year. It is possible to have a winter Heath garden, and if one is only in the garden during summer, then a summer Heath garden is equally satisfactory.

The surroundings should be as natural as possible; never make a Heath garden close to the formal Rose garden. Pine trees and Silver Birch will give a good background, but away from anything formal the Heath garden may be commenced. The soil may be anything, almost, provided it is free from lime, for very few Heaths will grow in a soil containing lime. Clay is not suitable but may be made suitable by deep trenching, with good drainage and plenty of gritty sand and leaf-mould; but a sandy soil such as one sees Heather thriving on, is the best and easiest to work. For position, choose full sunlight; no more, no less. The lay-out of the Heath garden will depend on the area intended to be planted and the natural lie of the

ground; for preference, if an all-the-year-round Heath garden is proposed, it should be large enough to allow the planting of each variety in fairly large groups, and the lie of the ground should be undulating, whether natural or otherwise. Paths should be narrow and winding, either of grass or dwarf Heath, or even creeping Thyme—but I prefer that sort of turf seen on moorlands or even what I call "starvation" land, where it grows dense and never tall. This will not require much mowing.

Planting may be done at any time of the year if the plants are grown in pots, but otherwise late October to late March is the season, much depending on the soil. On a light, warm, sandy soil, autumn planting is best, but on a heavy, cold soil, I certainly prefer spring planting.

If the plants are pot-grown, be sure that the roots are well soaked with water before planting, whatever time of year it may be, for nothing is so difficult to water effectively as a dry ball of soil once it is planted. There is a firm that specialises in Heaths, and all plants are propagated by cuttings and pot-grown; they are of necessity small when sent out, but obviously the constitution is sound, and in the long run they will succeed better than the plants propagated by division, but at the same time there are plenty of good divided plants to be had as well as plenty of bad ones, and much may be learned by examining them and seeing what the roots are like. If there are long, leggy, hard, woody stems, with a few fibrous roots at the base, discard them, but if they are bushy, compact, with a short mass of fibrous roots, plant them in suitable soil and they should succeed. I prefer the pot-grown plants, for although they may be smaller and more expensive, they are the best.

As the Tree Heaths cannot be propagated by division, they are usually grown in pots and are preferable so, but large plants, if transplanted carefully with a good ball of soil and roots, will move safely.

If the Heath garden is fully exposed to the sun, this often means exposure to winds also, and where strong winds are experienced it may be necessary to give the tall Tree Heaths some support or protection until they are established.

Planting should be done in large drifts of each variety, and care taken to mix the flowering periods so as to avoid large tracts of flowerless groups at any time of the year. Let each group run irregularly into those adjoining and avoid any suggestion of straight lines or round groups.

The Tree Heaths may be placed in small groups of three to nine of a sort, according to the size of the garden, and they should be planted amongst the dwarf sorts, giving them shelter from cold winds where possible. Each plant should have about four feet of space in which to develop, and the dwarf sorts from one foot to two feet, according to habit.

Once the Heath garden is planted, upkeep is inexpensive. The chief work will be weeding until the plants have grown sufficiently to cover the ground and suppress all unwanted guests. Some of the larger-growing Heaths may require trimming, and in the case of *Erica vagans*, this, I think, is best done in the early spring, just before growth commences. This will prevent the plants becoming too leggy and ragged and is best done regularly each year, as when cut back too hard into the old wood the plants will not break so freely, if at all.

The flowering season may begin at any time of year. *E. mediterranea hybrida* comes into flower first of the winter series, but last season for some reason, instead of opening in November, it was not until the end of February that it could be said to be in flower. Anyhow, being a hybrid raised by chance at Darley Dale, and sometimes known as *E. Darleyensis*—its parents being *E. carnea* and *E. mediterranea*—it would be expected to flower between the two parents, but my experience has generally been that it flowers before *E. carnea*. Much, of course, depends on the weather. It is a better and quicker grower than *E. carnea* but of a much paler colour; it is very free-flowering, of good habit and quite indispensable.

Then follows, as a rule, *E. carnea* and the hybrids, as they are so often called, but which are really varieties of *E. carnea*, and most of them were introduced by the firm of Backhouse. One variety, however, introduced from the

Continent stands out far and away above the others. This is *E. c. Vivellii*. It is a deeper colour than any of the others, and the foliage, in winter, changes to a brownish-red shade. The next best is *E. c. King George*, which flowers early and is of a rich colour. All the coloured varieties should be grown, for although there is not a great difference in the colour, the period is extended by them. *E. carnea* and its varieties will grow on a lime soil as also will *E. mediterranea* and *E. mediterranea hybrida*.

Following on the two already described comes *E. mediterranea*, which is taller in growth and paler in colour. It has several varieties. One of the best is the white form, and this should be grown in preference to *E. carnea alba*, although it flowers later. *E. m. hibernica* and its rare form named Brightness, hail, as the name suggests, from Ireland. The latter is worth growing if the true plant can be obtained.

From Christmas onwards one may expect to have the Tree Heaths in flower, commencing with *E. lusitanica* (syn. *E. codonodes*). The flower buds are tinged with pink and open a pure white. Its flowering season depends on the winter, but December to March will see it open. *E. Veitchii* follows close on this and is a hybrid between *E. arborea* and *E. lusitanica*. Roughly described, it is similar to *E. lusitanica*, except that the buds have no pink in their colour. *E. arborea* is slightly later, its habit is dense, while more so and hardier is the variety *alpina*, with white flowers scented like Hawthorn. *E. australis* is the last to flower, continuing well into May; the flowers are deep rose. It is somewhat inclined to be leggy, and therefore I always like to pinch young growths back to make them form a bushy plant. As this Heath flowers in May it is doubly welcome because it fills in a gap between the winter-flowering and summer-flowering Heaths. There is a rare white form named Mr. Robert, which was found in southern Spain by the late Lt. Robert Williams, and named after him.

Now come the early summer varieties, and I give them irrespective of their flowering period. *E. cinerea* is the Bell Heather, and the typical plant is known to everyone. Its forms are several, and the best are *alba major*, and a dwarf form, *alba minor*. *E. c. coccinea* is the brightest of all Heaths, but is a slow grower and of dwarf habit; its colour alone makes it worth growing. *E. c. rosea* is a very free-flowering deep rose variety, and there is an improved form, with much larger spikes of bloom, named Rose Queen. *E. c. pallida* has flowers of a pale mauve tint and is quite attractive if planted near a dark-coloured variety.

Erica ciliaris, the Dorset Heath, is found in this country chiefly round about Wareham. It has large flowers of a clear pink, and growing under ideal conditions will reach nearly two feet in height. It appears to succeed in moister ground than most Heaths. There are, I believe, three or four varieties, including a white one, but the best is *E. c. Mawcana*, of strong growth and with larger flowers than the type. *Erica*.

(To be continued).

ROSE GARDEN.

ROSE SCHNEEZWERG.

THE merits of this hybrid rugosa Rose are not widely known, otherwise it would be more generally cultivated, especially as a shrubby plant or for forming a hedge. The pure white, semi-double flowers are produced in clusters, the season of blooming extending over such a long period as to warrant the name "perpetual."

The flowers are succeeded by small, globular berries which are now beginning to turn colour. The foliage is very attractive and not so coarse as in the ordinary rugosa type.

A specimen of this Rose in Messrs. Geo. Bunyard and Co.'s nursery at Allington has been a conspicuous object all the summer. When I saw it I was impressed with its worth, and visualised how beautiful a hedge of this Rose would appear at all seasons of the year. T.

MARKET FRUIT GARDEN.

THERE is no need for any description of the weather of the past month, for every gardener knows only too well that it could hardly have been worse. A few remarks on the effect on fruit crops of such an exceptionally wet summer may not, however, be without interest. Perhaps the most surprising feature of the season is the soundness of the hard fruits. There was less splitting and rotting amongst Plums than there usually is; and all the Apples picked so far have kept better than early and mid-season varieties commonly do. These varieties were also highly coloured; but this is generally the case in a wet season. Late Apples are maturing very slowly, but will probably colour equally well if allowed to hang long enough. It is reasonable to hope that they will also follow the example of the earlier kinds and keep well after picking.

Having thus looked on the bright side of the picture, I must now turn to the other. From a market grower's point of view, the worst features of the wet season have been the difficulty of dealing with weeds, the frequent interruption of picking, and the depressed state of the markets. On most fruit farms weeds have gained complete mastery, and the work of cleansing bush fruit plantations will be very heavy. Horse cultivation and hand hoeing have been practically useless, and there appears to be no alternative to hoeing the weeds out of the rows later on, and then ploughing between the rows so as to throw the soil towards the bushes. Much as I dislike this method, it is preferable to digging in the actual rows, particularly when there are many weeds to cover. Interruption to picking will make this a long and lingering fruit harvest. I do not expect to gather the last of my Apples until November; and meanwhile they are exposed to loss through gales. The full effect of the unseasonable weather will not, unfortunately, be realised in the present year. When a heavy crop of Apples and a summer with more than the average rainfall occur together, the crop of the following season is invariably very light. Those who have a good crop this year will therefore be wise to anticipate poor results in 1928.

APPLES PLENTIFUL.

I have often, in these notes, asserted that the habit of bearing in alternate years has much more to do with the success or failure of the Apple crop than has frost, which is commonly blamed for all failures. The present season gives support to this view. The crop reports recently published in these pages show that, in spite of the exceptionally severe spring frosts, good yields of Apples are by no means uncommon. The reason is that, after last year's almost universal failure, the trees were very decidedly in their "on" year, and the very severe frosts were not sufficient to prevent bearing in many cases. It is to be hoped that, after this, frost and cold winds at blooming time will not be given quite so often as an excuse for a poor crop of Apples.

In my own plantations the yield is very heavy. Beauty of Bath alone provided very nearly as much fruit as did all varieties together last year. Worcester Pearmain gave a splendid crop of very high quality. Cox's Orange Pippin and Blenheim Pippin are fairly plentiful with me; and Allington Pippin, for once almost free from scab, promises a heavy yield of nicely-coloured Apples. As for cooking varieties, these are nearly all over average. Of those which remain to be gathered, Lane's Prince Albert and Bramley's Seedling are loaded.

GRADING AND PACKING.

In spite of the poor demand for Apples, I am having a thoroughly good season with this crop. Although the markets have been overfilled with under-sized and low-grade cooking Apples, and low prices have been received for many such consignments, large and clean cooking Apples have, as usual, sold fairly

freely at prices not to be despised. As for dessert varieties, I have no reason to complain. Clean, highly-coloured samples have sold well enough if properly graded and packed. I am using the half-bushel box this season for the first time for dessert Apples of the higher grades, in preference to the standard bushel box, and I like it very much. As compared with the larger box, there is probably no advantage in price, but the half-box is easier to pack. Only a very slight bulge on the lid is necessary to keep the smaller quantity of Apples firm, which means less risk of bruising. I have always considered that the bushel is too large a unit for choice dessert varieties, and should like to see the newer half-box become the standard. It is just as well, moreover, to be a little bit different from the overseas grower. At a time when the general price for quite good, though mixed, samples of Worcester Pearmain was quoted at 3s. per half-sieve, in London, I received from 8s. to 10s. per half-box of about 20lb. For identical Apples, properly graded and ringed into half-sieves, I received from 5s. to 6s. only. For the very finest Apples, not less than two-and-a-half inches in diameter, there is nothing better than the single-layer tray. Worcester Pearmain packed in this realised from 2½d. to 3d. per Apple. I have just received 20s. to 22s. per half-box for my first consignment of Cox's Orange Pippin. Needless to say, in all these cases, the fruits were perfectly clean, highly coloured, and very closely graded for size. These points are of much more importance than the choice of package.

In order to secure such results, one must first of all contrive to grow a crop free from scab and other skin blemishes, a matter which has been fairly easy this year, owing to the dry May, but which is very difficult in some seasons. The proportion of rough fruit is small in my crop this year, but what there is is ruthlessly sorted out and sent to a market which can deal with such stuff. Quite small cooking Apples are sold direct to a jam factory. A good many growers now adopt similar or even better methods. If the rank and file were to follow suit, there would probably be much less reason to complain of slow sales and low prices. The public now demand Apples of good quality, and there is practically no demand for inferior samples. There is little to be made of Apples except by growers who manage, by attention to every detail of cultivation, especially spraying and thinning, to produce a crop of high quality, and who follow this by careful grading and packing.

PLUM PRESIDENT.

For once in a way, President, the latest variety amongst my Plums, gave quite a good account of itself this season. This variety has previously been very disappointing. It generally blooms profusely, but seldom crops well; and much of the fruit often rots. The Blossom Wilt form of Brown Rot has, I am sure, been the chief reason of the poor set of fruit. Much of the bloom used to wither and turn brown; and the young shoots were also affected, the bark being covered with brown patches. After three successive years of tar-distillate spraying this disease is undoubtedly disappearing. Although President has little flavour to commend it, it is a fine-looking Plum, and is valuable for its lateness, generally realising satisfactory prices. It is a great pity that so few Plums of real dessert quality yield well enough to be worth including in a market plantation, for there is a demand amongst the public for Plums of good flavour which may be eaten raw. Victoria is the only largely-grown Plum which is really fit for dessert; and this is not being planted widely on account of its liability to silver-leaf.

TWO DISEASES.

Amongst the unwelcome results of the unseasonable weather I ought to have included two diseases, Leaf Scorch and Sooty Blotch. The former is unusually prevalent in my district on Apples and various bush fruits; and I have received specimens from other parts of the country. Although it is often a sign of lack

of potash, in this case it is probably due to defective root-action caused by the water-logged state of the soil. The other disease, Sooty Blotch, appears on the fruits of Apples, and is due to the fungus *Cleodes pomigena*. It does not seem to be very commonly recognised, and is not described in any of the text books I possess, although it has been mentioned in publications of the Ministry of Agriculture. Probably it is not found in all districts; but in mine there is generally a little of it on late Apples. As its name implies, it causes sooty-looking spots on the skin of the fruit; and in serious cases these blotches run together, making the fruit appear very dirty and unattractive. It is fortunately entirely on the surface, and can be wiped off with a damp cloth, except when it appears on a variety with a velvety skin, such as Blenheim Pippin. My worst attack this year was on Lord Derby, and the labour of wiping all the fruits was considerable. In this case the trees had received no fungicide spraying for scab prevention, which, I think, accounted for the serious attack, for none of my sprayed trees are anything like so badly affected. I have seen it stated in American publications, however, that the usual scab spraying is too early for Sooty Blotch, and that an application of fungicide in July is necessary. *Market Grower*.

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, Ante pp. 131-137).

(Continued from p. 293).

ENGLAND, S.

BERKSHIRE.—The fruits in these gardens are of good quality and the crops in most cases up to average. Our Strawberry crop was quite equal to any I have seen here, and the berries were of good size and excellent flavour. Gooseberries and Currants were exceptionally plentiful. Plums, with the exception of Monarch and Diamond, were good, especially Utility. Damsons were poor, both in crop and quality. Apples promised a very heavy yield, but Beauty of Bath failed. This Apple was severely cut by frost early in May, although the flowers had been over some days previously. We registered 9° of frost on May 1, but except for injuring some of the more forward blossoms, and the Apple mentioned above, it did little harm. *Stanley R. Gammon, Farley Court Gardens, Farley Hill, Reading*.

—The fruit crops are, on the whole, much better than last year. Small fruits yielded well. Some sorts of Apples are plentiful, but certain varieties suffered severely from frost. On April 27 we experienced 7°, on 28 7°, on April 30 8½°, on May 1, 7°, and although Apples were late in flowering the bloom suffered before it was expanded. Pears are a very poor crop, but Raspberries yielded well. All fruit trees look very healthy and clean. *J. Kitt, Wasing Place Gardens, Aldermaston*.

—The severe frosts in April are responsible for a light Apple crop, but the trees are clean; such varieties as Ribston Pippin, American Mother, James Grieve, Ellison's Orange, Beauty of Bath, Sturmer Pippin, Keswick Codlin, Lord Derby, Rev. W. Wilks, Newton Wonder, Bismarck, Bountiful and King Edward are carrying good crops. Strawberries were a failure and I am inclined to think that the inclement weather in late spring was somewhat responsible. Some were planted in frames and some of the same stock was used for forcing and planted outside. Those in the frames and pots gave good crops, whilst those outside of the same stock never grew, but dwindled away. Two fresh plantations were planted this last spring and look like giving good returns next summer. The dry weather of May was not very beneficial to them. All bush fruits cropped well. Our soil is of a light texture and on a subsoil of clay. *A. B. Wadds, Englefield Gardens, Reading*.

DORSETSHIRE.—The prospects in early spring were very promising, but we had 18° of frost in the late spring followed by drought, which ended in June. Apples flowered well, but the frost destroyed many flowers, the anthers and stigmas being blackened, in some cases in the unexpanded buds. The bulk of the Pear crop was destroyed, only a few fruits maturing on cordon trees on walls. Plums in the open suffered badly, the embryo fruits being blackened and destroyed, but for some obscure reason two or three trees were not affected. Peaches and Nectarines were satisfactory, and, strange to state, these fruits did not suffer from frost, although growing on an east wall, and unprotected. Apricots are never too satisfactory here; the branches die back in spite of every care. Loganberries, Raspberries and Black Currants were thinned by the frost, but a good crop remained, the fruits being the finest I have seen for many years. Red Currants were fine, and I attribute the size of the fruits to a partial thinning of the crop by the frost, whilst the June rains came in time for the final swelling. The frost utterly destroyed the first crop of Strawberry flowers, even in the small bud stage. The plants developed a second crop of trusses which bore well, but the dry period in May and early June made the crop a light one, although the berries were of good quality. Gooseberries, of which we grow quite a number, presented an extraordinary appearance after the severe spring frost. Berry's Early Kent was ready to gather, but 70 per cent. to 80 per cent. of the crop was destroyed, the fruits going quite soft, appearing exactly as if they had been partly boiled. The older portion of the gardens here are situated in a valley, at the base of a watershed, and the soil may be described as a good garden loam. A more recent addition to the gardens is on higher ground, and the soil is a good medium loam overlying chalk. *Henry F. Maidment, The Gardens, Criche Estate, Wimborne*.

—The fruit crops are a great disappointment; until the last week in April everything was promising a good season, then, on the mornings of the 27th and 28th, we registered 22° and 21° of frost, which not only destroyed all flower that was open but spoiled many that were not expanded. We had a fortnight of north-east winds which finished the work of the frosts. Apples are a very thin crop; Bramley's Seedling and Newton Wonder have quite failed; Warner's King is good, and we have a fair sprinkling of dessert varieties. Raspberries were good but Loganberries were poor and Gooseberries only about half a crop. Currants were satisfactory. The Strawberry crop was the worst I have ever known. Peaches produced a full crop; the trees had plenty of foliage when the frost came, having flowered very early. *W. E. Axford, St. Giles Gardens*.

HAMPSHIRE.—The fruit crops generally are very good, though the late spring frosts destroyed the early Strawberries, Pears and certain varieties of Plums. The frosts were followed by cold winds. Scarcely any dews were noticed to assist the growth, which are essential during such dry spells. The rain came late in June and this assisted fruits of all kinds wonderfully, including late Strawberries. Such varieties of Plums as Denniston's Superb, Utility, Laxton's Supreme, Coe's Golden Drop, Prince of Wales, Kirke's, and Merryweather Damson carried very good crops. Apples are very good; Cox's Orange Pippin, Charles Ross, Allington Pippin, Worcester Pearmain, Lady Sudeley, Wealthy, Ben's Red, Beauty of Bath, Bramley's Seedling, Norfolk Beauty, Grenadier, Warner's King, Lane's Prince Albert, Mère de Ménage and Lord Grosvenor are all heavily cropped. Raspberries gave a bountiful crop of very fine fruits, including Lloyd George, Park Lane, The Devon and Pine's Royal. Black, Red and White Currants had fine, clean crops. The soil is a heavy loam resting on a stony, yellow clay. *George Ellwood, Swanmore Park Gardens, Swanmore*.

—The fruit crops generally are fairly good. Apples are exceptionally plentiful, and we had to thin the fruits; the trees are very clean and healthy. Pears and Plums are very patchy;

in some gardens in this district there are good crops of these fruits, in other places they are failures. Small fruits, such as Gooseberries, Raspberries, Loganberries and Black Currants were satisfactory, but Red and White Currants were not so good. The yield of Strawberries was poor; all the early flowers were cut off by frost, and afterwards dry weather set in, so that the late flowers were ruined; in fact, it was the worst crop for years. The soil is a medium loam on limestone. *George Summersell, Buriton House Gardens, Petersfield*.

—The fruit crops are very satisfactory; Apples in particular are a heavy crop and practically all sorts are yielding well. Trees of Bramley's Seedling, which suffered injury from frost in many districts, are simply laden here, and all fruit trees are wonderfully clean. Pears and Plums are average crops. The Strawberry was the only fruit which suffered to any considerable extent from the late frosts, yet we had a fair yield, although continuous wet weather spoilt many of the berries. All small fruits were plentiful and of excellent quality. *A. J. Legge, Dogmersfield Park Gardens, Winchfield, Basingstoke*.

—There was every prospect of bounteous fruit crops in spring, following the beneficial effects of last autumn's summer-like weather in ripening the wood and fruit spurs, perfect ripening of the growth being evident in the spring by the large quantity of blossom on most fruit trees. As sometimes happens after a mild winter, late frosts occurred, 14° being registered on April 28, the lowest temperature since the closing days of October; we had 9° on April 29, 8° on the 30th, and 10° on May 1, following a burst of summer weather earlier in the month which had hastened the development of all growth. These frosts caused irreparable damage to the young growths of shrubs and flowers. The stigmas, pistils and anthers were damaged in the undeveloped blooms. These gardens are somewhat exposed, on a chalk formation in a low-lying position, with the River Test flowing through them, and are not first-rate for fruit growing. Other gardens in the district, especially those less exposed to the north and east, and those near to the New Forest, report a better yield than ours. *Frederick Gooch, Bossington House Gardens, Houghton, Stockbridge*.

—The fruit crops generally are light. The trees blossomed well, but sharp frosts on the nights of May 25, 26 and 27 did severe damage. Of small fruits, Raspberries were an exceptionally good crop. Strawberries were not plentiful, but the berries were of good size and flavour. Gooseberries were a good crop and the berries of very large size. Red and Black Currants were poor crops, but Cherries were an average yield, both the sweet and Morello kinds. Plums also were a light crop. Pears seemed to set well, but owing to the frosts most of the fruits dropped from the trees. Apples are about an average crop, our best varieties being Cox's Orange Pippin, Lane's Prince Albert, Worcester Pearmain, Galloway Pippin, Keswick Codlin, Lord Suffield and Easter Pippin. *William G. Osborne, Sutton Manor Gardens, Sutton Scotney*.

KENT.—Owing to the uneven effect of the serious spring frosts, this report applies only to my own crops. The wet June and July has left a sad harvest of scab on hard fruits, and a great part of the mid-season and late Cherry crops were ruined and abandoned. Small fruits, however, rejoiced in the abundant moisture, and Raspberries and Gooseberries have been unusually good. *Edward A. Bunyard, Allington, Maidstone*.

—Taking my orchard of about five acres for the basis of my report, the following relates to the Apple crop. Dumelow's Seedling (Wellington), one-third of a good crop (28 trees); Lane's Prince Albert, two-thirds (28 trees); Cox's Orange Pippin, one-third (about 30 trees); Warner's King, two-thirds (28 trees); Peasgood's Nonesuch, one-third (25 trees). I note a large trade grower within half-a-mile from here, on his whole plantation, a very large one, has not a bushel of Apples of this last variety. Beauty of Kent, two-thirds (about 30 trees);

Baumann's Red Winter Reinette (25 trees), a very small crop; James' Grieve, one-third crop; Gascoyne's Scarlet, half-a-crop (75 trees); (contrary to usual results, the crops show that there are more fruits on the Crab stock than on the Paradise stock); Blenheim Pippin, two-thirds of a crop (7 trees); Annie Elizabeth, full crop (one tree); Lord Suffield, two-thirds of an average yield; and Ribston Pippin, two-thirds. Charles E. Shea, *The Elms, Foots Cray, Kent*.

(To be continued).

A COLOUR CORRELATION IN THE POTATO.

SEVERAL colour connections in the Potato have been already recorded. In 1922 the writer* reported that pigment in the placentas of the ovary and fruit was always associated with coloured tubers; Salaman† has enumerated several correlations, the most complete of which are those between colour in the anther and colour in the tuber; Snell‡ was the first to draw attention to the connection between flower and sprout colours; and it is a matter of common knowledge that sprout colour is associated with any colour which may appear on the tuber or stolon. The present article deals with a correlation which exists between flower colour and the location of pigment in the tuber.

It has been known for some time that coloured varieties of Potatoes differ in respect of the tissues in which most colouring matter is found in the tubers; in some it appears to be entirely in the cortex and in others mainly in the cork cells. The colouring is due to a pigment dissolved in the cell sap and it may be found in the cortex, secondary cortex and cork. In some varieties, however, the cork cambium appears unable to give rise to pigmented cork cells. The importance of the above, especially from a genetic standpoint, has been stressed by Krantz§ and, in order to accumulate data concerning British varieties, an examination of all common commercial Potatoes and many seedlings was made during August and September of the present year. Determinations were made with the aid of a microscope, but it may be stated that, with immature tubers at least, the location of the pigment may be ascertained with the naked eye.

According to the information obtained, coloured tubers may be arranged in the following groups: (A) Colour entirely in the cortex; (B) Colour in both cortex and cork; and (C) Colour mainly in cork, but a little appearing in the cortex in the neighbourhood of the eyes and lenticels. Although the colour may be only faint it has been found in all varieties examined in the secondary cortex in the neighbourhood of the eyes and lenticels. The majority of whole-coloured varieties belong to group A, and parti-coloured varieties to group C, but there are exceptions, and these are of importance from the systematic point of view.

It was considered likely that where colour appeared in the cork of the tuber it might also be found in the absciss layer at the junction of the pedicel and peduncle. In most varieties a slight colouring is to be found in this tissue. Unfortunately, owing to the incidence of Blight, complete observations could not be made, but of all the varieties available for inspection the following were outstanding because of coloured absciss layers, viz., Rector, Lord Tennyson, The Dean (A. Dean), Adirondack, Beauty of Bute and Buchan Beauty. It is noteworthy that all these varieties have colour in the tuber cork cells.

It was next sought to correlate, if possible, flower colour with tuber colour, and it was found that, without exception, in the eighty-nine varieties examined, whenever colour appeared in the cork cells of the tuber the flower, when it existed, was coloured. Indeed, the flower colours of a number of seedlings were predicted

before they were known. The actual colour, of course, corresponds to the tuber colour red-purple or blue-purple, according as the tuber colour is red or purple. When colour is absent from the cork cells there is, so far, no certain means of predicting whether the flower will be coloured or white; many white-skinned varieties and many which have colour in the cortex only, have coloured flowers.

SUMMARY.

(1) Pigment in whole-coloured and parti-coloured tubers may be located in the cortex alone or in the cortex and cork in varying proportions.

(2) A highly pigmented absciss layer at the junction of the pedicel and peduncle appears to be associated with colour in the tuber cork.

(3) Pigment in the tuber cork appears to be definitely correlated with coloured flowers. T. P. McIntosh.

FIG. 140.—BANANA IN FRUIT AT LAYTON MANOR, WEST LAYTON, RICHMOND, YORKS.

HOME CORRESPONDENCE.

[The Editors do not hold themselves responsible for the opinions expressed by correspondents.]

Musa Cavendishii.—I enclose a photograph of a fruiting specimen of *Musa Cavendishii* (see Fig. 140). The bunch carried about one-hundred-and-fifty "fingers," two of which I send for you to taste. The specimen photographed is growing in the gardens of H. C. Embleton, Esq., Layton Manor, West Layton, Richmond, Yorkshire. Although so far north, we have been very successful with Bananas, and the flavour of the fruits produced is very

much finer than that of imported Bananas. R. Cooper, *Layton Manor Gardens*.

[The fruits were of good size and excellent flavour.—Eds.]

Foxgloves and Verbascums.—Some three years ago, a few white Foxglove plants appeared here after some considerable clearing up, and alongside grew a tiny specimen of *Verbascum*. This *Verbascum* plant was very late and fragile, and in late October produced a few blooms. Later, I secured a pinch of seed, but when spring came I had lost or mislaid it. In the next year a considerable number of white Foxgloves appeared, but no *Verbascum*. I saved a larger quantity of the seeds of white Foxglove, and in the spring before last I sowed them. Instead of white Foxgloves, I had a crop of *Verbascum* plants, about one hundred or so, but there was no white Foxglove on the plot where I sowed the bulk of the seeds. A pinch of the seeds sown by me as a precaution in a shallow box produced plants (considerably retarded) which are evidently Foxgloves. Although the statement may seem somewhat incredible, I think it deserves to be reported. Edward O'Brien, M.A., *Falmore House, Moville, Derry*.

A Tall Foxglove.—I have a *Digitalis*, still in flower at the top, over ten feet high. Is this a record? R. Westmore, *Rockwood Gardens, Watford*.

The Effect of Creosote on Seedlings.—In the recent interesting article on the Selective Action of Tetrachlorethane on Plants (*Gard. Chron.*, September 17, p. 232) the contributor mentions, among other vapours, that of cresol as generally damaging to vegetation. An unsought experience I had here last spring suggests some selective action on the part of this substance. Late last winter, a row of brick hot-beds had its wooden framework renewed. In early March it is customary here to raise the Tomato plants required in one of these hot-beds. This year, as usual, they germinated quite readily, but soon showed signs of distress. Such behaviour was puzzling for a time, until I learned on enquiry that the joiners, in fixing the framework, had treated its underside with solignum, which, I imagine, is a proprietary preparation of creosote. It then became interesting to observe how various seedlings would fare in these frames. The Tomatoes declined to thrive at all, and to preserve them they had to be moved to a cold greenhouse, as there is no heated glass structure here, thus delaying their fruiting by a fortnight. Mustard, Cress, Radishes and early Turnips were badly affected. Globe Beet and French Carrots were unharmed, and gave good crops in the frames. Celery and Celeriac were raised without difficulty. Lettuces appeared to be immune, and Vegetable Marrows and Pumpkins flourished. Seedling Asters, Dahlias and *Ageratum* were unaffected. It is to be noted that the behaviour towards the fumes is apparently a family one. For instance, the Crucifers were sufferers, but the Umbellifers and Composites were resistant. The writer does not wish to stress unduly these observations. They were merely casual and not carried out as a scientific experiment. The different seeds were not all sown at the same time, and some of the seedlings, owing to their position in the frames, may have been less subjected to the fumes than others. That there was some selective action, however, can hardly be doubted. The sensitiveness of the Tomato seedlings was remarkable. A second batch, sown two or three weeks later, were likewise affected. On the other hand, the Carrots, for example, growing in proximity to the Tomatoes, behaved quite normally and suffered no check. It was noted in the case of the Tomato seedlings that the cotyledons became swollen and glazed, then they slowly browned, eventually shrivelling from the tip downwards. The first foliage leaves were stunted in size and also, sooner or later, began to brown and wither similarly. A peculiar feature noticed when potting the seedlings was the brittle nature of the cotyledons and first leaves; it was difficult to avoid breaking them. The Tomatoes, I may state, recovered perfectly when removed in time from the frames, and have given a good crop of fruits. J. Parkin, *Blaithewaite, Carlisle*.

SOCIETIES.

ROYAL HORTICULTURAL FRUIT SHOW.

OCTOBER 11.—In the opinion of all who attended it, the great Fruit Show held at Vincent Square on this date was a very fine one. Entries were numerous and the competition was keen throughout almost all the one-hundred-and-fourteen classes, and the quality of the fruits exhibited was of a very high average. In size and colour the Apples were especially fine, while Grapes were, on the whole, of better quality than usual. In the Grape classes and the dessert fruit classes competition was excellent. The commercial fruit classes attracted considerable attention, and the trade displays, though necessarily limited in extent, added to the interest and appearance of the show. The hall and annexe were so well filled with fruit exhibits that there was no room for displays of flowers and plants.

Several plants were brought up for consideration by the Floral and Orchid Committees, which, however, did not meet; members were present as they had received no notice to the effect that their attendance would not be required on this occasion.

GRAPES.

There were three collections of twelve bunches of Grapes, wherein four varieties (one of which must be white), three bunches of each, were required. The first prize, a Silver Hogg Medal and £15, was won by the Duke of Newcastle (gr. Mr. S. Barker), Clumber, Worksop, with a handsome set that consisted of three very big bunches of Gros Guillaume, three finely-berried and well-finished clusters of Gros Colman, three beautifully coloured bunches of Muscat of Alexandria and three of Mrs. Pearson. In pointing, the judges were instructed to regard each three bunches as "a dish," and they awarded 9½, 8½, 8 and 9 points, respectively, or a total of 35 points out of a possible 43. Second prize was awarded to Mrs. T. S. HALL (gr. Mr. G. Richardson), Cricket St. Thomas, Chard, for an even set of Muscat of Alexandria, Madresfield Court, Black Hamburgh and Alicante, the pointing being 8, 7, 7 and 7, respectively, or 29 out of a possible 43. Third prize was won by G. MAYER, Esq. (gr. Mr. R. Cottam), Wistler's Wood, Woldingham, with Prince of Wales, Lady Downes, Alicante and Muscat of Alexandria to which 7, 6, 6 and 6 points were awarded respectively, or 25 points out of a possible 43.

For four bunches of Grapes, two bunches each of a white and a black variety, LORD SWAYTHLING (gr. Mr. F. J. Rose), Townhill Park, Bitterne, Southampton, easily won the premier award among seven competitors. He showed splendid, large and shapely bunches of Muscat of Alexandria and Mrs. Pince, gaining 10 out of 12 points, and 9 out of 11 points, respectively; total, 19 out of 23; second prize, LADY DURNING LAWRENCE (gr. Mr. J. Rutherford), King's Ride, Ascot, for superbly berried bunches of Muscat of Alexandria, 11 points, and Alicante, 7 points; total, 18 out of 22; third, Captain R. B. BRASSEY (gr. Mr. J. G. Quinn), Cottessbrooke Hall, Northampton, with Muscat of Alexandria, 8, and Madresfield Court, 8; total, 16 points out of 23.

In the other Grape classes, two bunches of specified varieties were required. In the Lady Downes class, Mrs. T. S. HALL led, followed in order by G. MAYER, Esq., and VISCOUNT HAMBLEDON (gr. Mr. W. Turnham), Greenlands, Henley-on-Thames; five entries.

Five competed in the class for a pair of bunches of Mrs. Pince, and here LORD SWAYTHLING led with heavy, well-finished clusters, followed by Captain M. DRUMMOND (gr. Mr. L. A. Smith), Cadland Park, Southampton; no third prize was awarded.

The Hon. Mrs. TUFTON (gr. Mr. H. H. Brown), Castle Hill, Englefield Green, had the best pair of bunches of Alicante and they were particularly good ones, both in size and berry; second, Sir HUGO CUNLIFFE-OWEN (gr. Mr. F. Tester),

Weir Bank, Bray, Berkshire; third, Captain R. B. BRASSEY; eight entries.

Captain BRASSEY led in the class for Madresfield Court with heavy bunches; second, the DUKE OF NEWCASTLE; only two entries. The best pair of bunches of Appley Towers was shown by LADY JULIET DUFF (gr. Mr. H. Weaver), Coombe Court, Kingston Hill, and though there were heavier bunches, these were the best finished of the four sets; second, Sir CHARLES NALL-CAIN (gr. Mr. T. Pateman), Brocket Hall, Hatfield; third, Mrs. T. S. HALL.

In the class for any other black Grape, the DUKE OF NEWCASTLE won first prize with Black Hamburgh; second, Mrs. T. S. HALL, with the same variety; third, LORD SWAYTHLING, with Gros Colman, fine in bunch and berry but rather red in colour.

The class for two bunches of Muscat of Alexandria proved an attractive one as there were thirteen competitors. Large-berried, amber-coloured clusters won first prize for LADY DURNING LAWRENCE; second, Mrs. HORNBY LEWIS (gr. Mr. A. E. Friend), Danesfield Park, Marlow; third, the DUKE OF NEWCASTLE, Clumber.

In the "any other white" class, LORD SWAYTHLING led with big bunches of Mrs. Pearson; second, Captain BRASSEY, with Golden Queen; third, the DUKE OF NEWCASTLE, with Mrs. Pearson; eight entries.

COLLECTIONS OF DESSERT FRUIT.

The best collection of nine dishes of ripe dessert fruits, not fewer than six kinds, came from the DUKE OF NEWCASTLE, who showed Muscat of Alexandria and Gros Colman Grapes; Hero of Lockinge Melon; Doyenné du Comice and Pitmaston Duchess Pears; Golden Eagle and Princess of Wales Peaches; and Cox's Orange Pippin and Ribston Pippin Apples; total, 67½ points; second prize was awarded to Captain M. DRUMMOND, whose very showy collection consisted of heavy bunches of Muscat of Alexandria and Alicante Grapes; Superlative Melon; Salway Peaches; Beurré Superfin (over-ripe) and Louise Bonne of Jersey Pears; Coe's Golden Drop Plums; and Cox's Orange Pippin and James Grieve Apples; 64½ points; third, Sir CHARLES NALL-CAIN, 63 points.

In the smaller class for six dishes of four kinds of ripe dessert fruit, LADY JULIET DUFF secured the first prize with good bunches of Muscat of Alexandria and Appley Towers Grapes; Prince of Wales Peaches; Triomphe de Vienne Pears; Hero of Lockinge Melon; and Worcester Pearmain Apples; 40½ points; second, Mrs. T. S. HALL, who had Muscat of Alexandria and Prince of Wales Grapes; Superlative Melon; Doyenné du Comice Pears; and Cox's Orange Pippin and Ribston Pippin Apples; 39½ points; third, Mrs. HORNBY LEWIS, 35 points. There were five entries in this class.

COLLECTIONS OF HARDY FRUITS.

In the class for a collection of thirty dishes of hardy fruits grown in the open air and arranged on a space twelve feet by three feet, the first prize was won by Captain M. DRUMMOND (gr. Mr. L. A. Smith), Cadland Park, Southampton, who exhibited very fine examples of Stirling Castle, Herring's Pippin, Peasgood's Nonesuch, Mère de Ménage, Warner's King, Ellison's Orange, Charles Ross and Lane's Prince Albert Apples; Triomphe de Vienne, Doyenné du Comice, Conference, St. Luke, Beurré Alexandra Lucas and Charles Ernest Pears; White Marseilles Figs, Salway Peaches, Morello Cherries and Coe's Violet, Wyedale, President and Coe's Golden Drop Plums; second, Sir CHARLES NALL-CAIN (gr. Mr. T. Pateman), Brocket Hall, Hatfield, who had very fine dishes of Peasgood's Nonesuch, Charles Eyre and Annie Elizabeth Apples; Pitmaston Duchess, Durondeau and Magnate Pears; Nectarine Peach, Coe's Golden Drop, Archduke, The President and Prince Engelbert Plums.

The best collection of twelve dishes of hardy fruits grown in the open air was shown by Col. F. J. D. WINGFIELD DIGBY (gr. Mr. E. Hill), Sherborne Castle, Dorset, who had a very excellent exhibit of highly-coloured fruits of Peasgood's Nonesuch, Cox's Orange Pippin, Rev. W. Wilks, Allington Pippin and Herring's Pippin

Apples; Doyenné du Comice, Marguerite Marillat, Pitmaston Duchess and Beurre Hardy Pears, and Coe's Golden Drop, President and Rivers' Late Orange Plums; total points, 55½; second, F. C. STOOP, Esq. (gr. Mr. G. Carpenter), West Hall, Byfleet, with 53 points; third, J. H. LOUDON, Esq. (gr. Mr. J. Bond), Olantigh, Wye, Kent. There were six exhibitors in this class.

COMMERCIAL FRUIT CLASSES.

Ten classes were arranged for competition amongst market growers. Combinations of individuals or firms were not allowed, nor could the fruit shown be the produce of different districts. The object of these classes was to illustrate the most suitable types of fruit and methods of packing. As the exhibits were sent direct by the grower to the show and opened by officials of the Society, it was a real test of method. In nearly all the classes the grading and packing were admirable, and it was very rare that an Apple showed any sign of being bruised. The quality of the fruit also reached a high standard of excellence, and most of the fruits which normally have coloured skins were of really brilliant appearance. There was no exhibit in the class requiring four British Standard boxes of Cox's Orange Pippin Apples, but the competition was very good in the other Apple and in the Pear classes.

The seven exhibits of four boxes of any dessert variety other than Cox's Orange were all filled with Apples of brilliant colour. One was a trifle over-filled, while a second erred in the opposite direction. The first prize was awarded to Mr. GLOVER LONG, Dairy Farm, Lower Higham, Rochester, for boxes of admirable Allington Pippin. The Apples were of very even quality and of splendid appearance. For packing, this exhibit received 38½ points out of a possible 40. The maximum was given for edible quality and for size, while for maturity, freedom from diseases and pests, and freedom from bruises and other damage only a quarter-of-a-point in each quality was lost. The second prize was awarded to the UNIVERSITY OF READING for most brilliantly coloured fruits of Worcester Pearmain. This exhibit was only a quarter-of-a-point behind the leader. The fruit itself was slightly superior, but the packing was one point behind.

There were eight exhibits of Bramley's Seedling, and the first prize was awarded to Mr. H. G. KLEINWORT, Wierton Place, Monchelsea, Maidstone, for four boxes of Apples of even quality and good colour, though the boxes were a trifle over-filled, and an occasional fruit showed a slight bruise. For packing, this exhibit received 38 points from a maximum of 40, while the fruit itself was pointed at 57½ from a maximum of 60. The second prize was awarded to the UNIVERSITY OF READING for well packed boxes of Apples of beautiful colour and even size.

Lord Derby, shown by the HOLLESLEY BAY LABOUR COLONY, Suffolk, with 39 points for packing and 58½ points for fruit, was first in the class for four boxes of any cooking Apple other than Bramley's Seedling. The UNIVERSITY OF READING showed highly coloured fruits of Newton Wonder and was again a close second.

The classes for three one-layer boxes of Apples were very popular with both the growers and the visitors. In the class for Cox's Orange Pippin the first prize was awarded to Mr. H. T. MASON, Hampton Hill, for even fruits which possessed the golden tinge which tells of good flavour, though they were just a trifle large. But 59½ points from a maximum of 60 were awarded for the fruits, and 23½ from a maximum of 25 points were given for packing. Mr. M. C. EVANS, Hatfield Peverel, was a good second in this large class. Charles Ross, of delicately beautiful colour, shown by the EXECUTORS of Mr. W. E. BEAR, Magham Down, Hailsham, was the best dessert variety other than Cox's Orange, and Worcester Pearmain, of very high colour, shown by the UNIVERSITY OF READING, was second. The judges did not state the number of points in this class.

Pears, shown in three one-layer boxes, were of irregular quality, but the best were very good indeed. The boxes of Conference, which won the first prize for the HOLLESLEY BAY LABOUR COLONY, were of very high quality, while Lt.-Col.

LUMLEY WEBB, Ham Green, Upchurch, was second. There were four exhibits of Doyenné du Comice, and here a Special Prize was awarded to Mr. J. MITCHELL, Longueville, St. Saviours, Jersey, for magnificent fruits, which were sent in boxes "not of the required dimensions." The second prize was awarded to Mr. C. H. H. WEEKES, Dukes Bradnich, for smaller Pears of even size.

In the two classes for four 12 lb. chip baskets of any black and any white Grapes, only Messrs. J. ALMOND AND SON sent exhibits. They were awarded the first prize for splendid bunches of black Grapes, and the second prize for shapely bunches of Muscat of Alexandria Grapes which, unfortunately, were not quite ripe.

AMATEURS' CLASSES.

Ten classes were provided for exhibits of Apples, Pears, Plums, Damsons and Autumn Raspberries grown by amateurs. Nearly all the Apples were of exceptional quality and the competition was very keen, but Pears were not so freely shown. There were many exhibits of sixteen dishes of culinary, and eight dishes of dessert Apples, and the best collection was shown by Captain M. DRUMMOND (gr. Mr. L. A. Smith), Cadland Park, Southampton, whose cooking varieties included excellent dishes of Rev. W. Wilks, Peasgood's Nonesuch and Bramley's Seedling, and he had splendid dishes of Ellison's Orange, Rival, Sir John Thornycroft and James Grieve amongst the dessert varieties. Col. WINGFIELD DIGBY (gr. Mr. E. Hill), Sherborne Castle, Dorset, was second, and he had brilliantly coloured fruits of Charles Ross, King of the Pippins, Cox's Orange and Baron Wolseley.

The many exhibits of eighteen dishes of culinary and four dishes of dessert Apples were of exceptionally high quality. The first prize was won by J. A. STIDSTON, Esq., Bishopsteignton, Devon, who included in Masterpiece and Crimson Peasgood's two new Apples of beautiful appearance. He also showed Sir John Thornycroft, Emperor Alexander, Baron Wolseley and Crimson Bramley, of very high quality. J. H. LOUDON, Esq. (gr. Mr. J. Bond), Olantigh, Wye, was a good second, and he showed James Grieve, Rev. W. Wilks and Peasgood's Nonesuch of fine quality.

Of the seven exhibits of six dishes of cooking Apples, the best was shown by Capt. DRUMMOND, who had exceptionally good specimens of Bismarck, Warner's King and Stirling Castle. In his second prize exhibit, A. JAMES, Esq., Bishopsteignton, Devon, included Rev. W. Wilks of beautiful-golden colouring.

Mrs. HELSHAM JONES (gr. Mr. F. Lock), Tile Barn, Newbury, won the first prize for nine admirable dishes of dessert Pears, which included Durondeau, Marguerite Marillat and Pitmaston Duchess of splendid appearance. J. A. STIDSTON, Esq., was second and he included Doyenné Bussoch and Durondeau of fine colour.

The best three dishes of Plums were shown by LADY MARY MORRISON (gr. Mr. W. H. Mills), Tisbury, Wilts., who had excellent dishes of Late Orange, President and Coe's Golden Drop. Captain DRUMMOND was second, and his best dish was of Coe's Golden Drop. Sir CHARLES NALL-CAIN, Bt. (gr. Mr. T. Pateman), Brocket Hall, Hatfield, was easily first with three dishes of Damsons or Bullaces. His varieties were Merryweather, Farleigh Prolific and Bradley's King. R. H. LING, Esq. (gr. Mr. D. W. Bedford), The Braes, Berkhamsted, was second. The Hailsham Berry, shown by Mrs. HORNBY LEWIS (gr. Mr. A. E. Friend), Danesfield Park, Marlow, was first in the class for a dish of autumn Raspberries, and Queen Alexandra, shown by Col. R. G. HOWARD VYSE (gr. Mr. F. S. Booke), Stoke Place, Slough, was second.

DISTRICT COUNTY CLASSES.

In most of the classes arranged for competition amongst amateurs in the various county districts the competition was good and the fruits of high quality, but there was no exhibit from the Channel Islands. In each district there were two classes, one requiring four dishes of culinary and two of dessert Apples, and the other for six dishes of dessert Pears.

Many amateurs competed in the Kent, Surrey, Sussex and Hants. section. The best Apples were shown by W. H. MYERS, Esq. (gr. Mr. G. Ellwood), Swanmore House, Hants., who showed excellent dishes of The Queen, Cox's Orange and Ribston Pippin. Mrs. WINTERBOTHAM (gr. Mr. G. Brown), Oakley Place, East Grinstead, was first with Pears, and the best dishes were of Beurré Superfin, Doyenné Bussoch and Beurré Diel.

Three exhibits of Apples were staged from the Western Counties, and the first five dishes of J. A. STIDSTON, Esq., Devon, were excellent; Cox's Orange, Blenheim Pippin, Emperor Alexander and Queen were splendidly coloured. LADY MARY MORRISON, who was first for Pears, was second. The dishes of Pears included excellent Conference, Doyenné du Comice and Marguerite Marillat.

In the Oxford, Bucks., Berks., Beds., Herts. and Middlesex class, the best of eight exhibits of Apples was shown by S. GARDNER, Esq. (gr. Mr. G. Sturt), Oakhurst, Harrow-on-the-Hill, who showed good dishes of Fearn's Pippin, Cox's Orange and Bismarck. Mrs. AUSTIN (gr. Mr. E. G. Longhurst), Ellern Mede, Totteridge, was a good second. Six exhibits of Pears were staged. The Rev. ROLAND SMITH (gr. Mr. H. Bates), Hertingfordbury Park, Hertford, was first, and he had good dishes of Louise Bonne of Jersey, Durondeau and Pitmaston Duchess.

The best of the five collections of Apples in the Essex, Suffolk, Norfolk, Cambridge, Hunts. and Rutland class was shown by Lt.-Col. HILDER, J.P. (gr. Mr. J. R. Smith), Huskards, Ingatstone, Essex, who staged Ribston Pippin, Cox's Orange Pippin and Peasgood's Nonesuch, of good appearance. H. G. BOIS, Esq. (gr. Mr. A. E. Moss), Billesley Manor, Alcester, was second with fruits of good colour. LORD SUFFIELD (gr. Mr. A. J. Jones), Gunton Park, Norfolk, had the best Pears, and showed fine dishes of Marguerite Marillat, Triomphe de Vienne and Beurré Bussoch.

Only two sets of Apples were shown from Lincoln, Northampton, Warwick, Leicester, Notts., Derby, Staffs, Shropshire and Cheshire. The first prize was won by W. FRITH, Esq. (gr. Mr. R. W. Thatcher), Carlton Park, Market Harborough, whose fruits of Emperor Alexander, Wealthy and James Grieve were of handsome appearance. Only the second prize was awarded for Pears which were shown by the Rev. H. M. BURDEN (gr. Mr. W. Parks), Whittington Hall, Chesterfield.

The EARL OF COVENTRY (gr. Mr. W. H. Wilson), Croome Court, Worcester, won both first prizes in the Gloucester, Worcester, Hereford and Monmouth class. His best Apples were Prince's Pippin, Cox's Orange Pippin and Warner's King, and he had good dishes of Beurré Hardy and Beurré Bachelier Pears.

LADY KNOTT (gr. Mr. W. E. Anderson), Close House, Wylam-on-Tyne, was the only exhibitor in the Northern Counties class, and was awarded both first prizes for very good dishes. The Apples included Charles Ross and Mabbott's Pearmain, while Marguerite Marillat, Beurré d'Anjou and Pitmaston Duchess Pears were very handsome.

F. J. CORBETT, Esq. (gr. Mr. J. Jones), Yns-y-Maengwyn, Merioneth, the only exhibitor for Wales, was awarded both first prizes. Amongst his Apples the varieties Peacemaker, Cox's Orange Pippin, Charles Ross and Emperor Alexander were excellent, as also were the Pears Durondeau, Conference and Pitmaston Duchess.

Of the Scottish exhibits of Apples, the best were from Major C. L. GORDON (gr. Mr. J. Duff), Threave House, Castle Douglas, who showed highly coloured fruits of Wealthy, Cutler Grieve and Worcester Pearmain. There were no Pears.

THE EARL OF BESSBOROUGH (gr. Mr. T. E. Tomalin), Piltown, Co. Kilkenny, had splendid dishes of Apples in the Irish class, and his first prize exhibit included Rival, Cox's Orange, Loddington and Lane's Prince Albert. The EARL OF DUNRAVEN (gr. Mr. E. S. Goff), Castletown, Carrick-on-Suir, was second, and he had highly coloured dishes of Worcester Pearmain, Charles Ross and Baron Wolseley. The prizes for Pears were won by the same exhibitors in the same order. The EARL OF BESSBOROUGH had hand

some dishes of Triomphe de Vienne, Conference and Doyenné Bussoch, and the second prize collection included Grosse Calebasse of good appearance.

SINGLE DISH CLASSES: APPLES.

Competition in these classes was keen throughout and the quality of the fruits was very good.

J. A. STIDSTON, Esq., Bishopsteignton, Teignmouth, was the most successful competitor and gained first prizes in the classes for Adams's Pearmain, American Mother, Blenheim Pippin, Duke of Devonshire, Egremont Russet, Ellison's Orange, King's Acre Pippin, Rival, William Crump, Bismarck and Stirling Castle.

The best dishes of Charles Ross, Cox's Orange Pippin, large fruits of Blenheim Pippin, Lane's Prince Albert, Newton Wonder, Norfolk Beauty and The Queen were staged by W. H. MYERS, Esq. (gr. Mr. G. Ellwood), Swanmore House, Swanmore. VISCOUNT HAMBLEDON (gr. Mr. W. Turnham), Greenlands, Henley-on-Thames, won first prize for Allington Pippin, and he was equally successful for a dish of Edward VII and for a dish of eight fruits of a variety not included in the schedule, with Charles Eyre.

The best dish of Claygate Pearmain was staged by Col. F. J. B. WINGFIELD DIGBY (gr. Mr. E. Hill), Sherborne Castle, Dorset, who was also placed first for S. T. Wright.

Mrs. R. LUKIN, Brookfield House, Burghfield Common had the best dishes of Gascoyne's Scarlet, James Grieve and Peasgood's Nonesuch; while H. W. HENDERSON, Esq. (gr. Mr. F. L. Pike), West Woodhay, Newbury, gained premier honours for Superb and Orleans Reinette. Captain M. DRUMMOND (gr. Mr. L. A. Smith), Cadland Park, Southampton, won first prizes for Ribston Pippin and Dumelow's Seedling, and F. C. STOOPE, Esq. (gr. Mr. G. Carpenter), West Hall, Byfleet, had the best dish of St. Cecilia. The first prize dish of Sturmer Pippin was shown by W. J. H. WHITTALL, Esq. (gr. Mr. J. M. Grant), Grayswood Hill, Haslemere, who also had the best set of Golden Spire.

In the class for one dish of eight fruits of any early variety not named in the schedule, and fit for use, C. BUTT, Esq., Northbrook, High Park, Ryde, Isle of Wight, was successful with the variety Coronation, and this competitor was also placed first for a dish of eight fruits of any late variety not named in the schedule, with King of Tompkin's County.

The best dish of Annie Elizabeth was shown by the TRUSTEES of the late Sir CHARLES HENRY (gr. Mr. W. E. Hewitt), Parkwood, Henley-on-Thames; while Mr. A. C. BARNETT, Moor Common, Lane End, Bucks., was first for Bramley's Seedling.

Sir CHARLES NALL-CAIN (gr. Mr. T. Pateman), had the best dishes of Crawley Beauty and Lord Derby, and A. H. PULLIN, Esq., Hawthorne Road, Wallington, was placed first for Ecklinville. The prize-winning dish of Encore was exhibited by H. J. EVANS, Esq., Taormina, Burdon Lane, Cheam; Mrs. DENNISTON (gr. Mr. Norris), Highdown, Compton, Winchester, had the best dish of Golden Noble; LADY MARY MORRISON (gr. Mr. H. H. Mills), Tisbury, Wilts., the best dish of Grenadier; Mrs. HORNBY LEWIS (gr. Mr. A. E. Friend), Danesfield Park, Marlow, Bucks., the best dish of Rev. W. Wilks; and G. E. DANKS, Esq., Rotherfield Road, Carshalton, the best dish of Warner's King.

The prize winning dish of eight fruits of the best flavoured Apple not mentioned in the single dish classes was won by the EARL OF BESSBOROUGH (gr. Mr. T. E. Tomalin), Emsworth, Hants., with St. Edmund's Pippin.

SINGLE DISH CLASSES: PEARS.

Captain DRUMMOND was very successful in the Pear classes, and gained premier honours for dishes of Beurré d'Anjou, Pitmaston Duchess, Glou Morceau and Louise Bonne of Jersey; while Mrs. AUSTIN (gr. Mr. E. G. Longhurst), Ellern Mede, Totteridge, Herts., was first for Beurré Bosc, and for a dish of eight fruits of any early sort not named in the schedule, with Souvenir du Congrès. The dish of Beurré Hardy shown by LADY MARY MORRISON was placed first, while Col. R. G. HOWARD VYSE (gr. Mr. F. S. Booke), Stoke Place, Slough, had the best Beurré Superfin; and Mrs. HORNBY

LEWIS the premier dish of Comte de Lamy, only two competing in this class.

J. A. STIDSTON, Esq., exhibited the first prize fruits of Conference and Thompson's; LORD SUFFIELD (gr. Mr. A. J. Jones), Gunton Park, Norwich, the best dishes of Doyenné du Comice and Marguerite Marillat; Miss J. PHILLIPS, Abbotskerswell, Newton Abbot, the finest examples of Durondeu; and Rev. ROLAND SMITH (gr. Mr. H. Bates), Hertingfordbury Park, Hertford, the premier dish of Emile d'Heyst. There were only two exhibitors in the class for a dish of Fondante d'Automne, and no first prize was awarded, Mrs. HELSHAM JONES (gr. Mr. F. Lock), Tile Barn, Woolton Hill, Newbury, being placed second.

For a dish of Josephine de Malines, the EARL OF BESSBOROUGH was placed first, and Captain R. B. BRASSEY (gr. Mr. J. G. Quinn), Cottessbrooke Hall, Northampton, had the best dish of Marie Louise. The DUKE OF NEWCASTLE (gr. Mr. S. Barker), Clumber, Worksop, excelled for Pitmaston Duchess, and also gained first place for a dish of eight fruits of any late variety not named in the schedule, with Charles Ernest. The best-flavoured Pear, not named in the above classes, was Seekle, shown by Col. R. G. HOWARD VYSE.

Fruit Committee.

Present: Mr. G. E. A. Nix (in the chair), Mr. J. Cheal, Mr. A. H. Pearson, Mr. P. C. M. Veitch, Mr. G. F. Tinley, Mr. H. S. Rivers, Mr. W. H. Divers, Mr. W. F. Giles, Mr. T. Pateman, Mr. A. Bullock, Mr. H. Markham, Mr. J. G. Weston, Mr. H. Prince, Mr. E. Neal, Mr. A. W. Metcalfe, Mr. F. Jordan, Mr. A. C. Smith, Mr. P. A. Tuckett, Mr. J. Harrison, Mr. G. Woodward, Mr. John Basham, Mr. E. A. Laxton and Mr. A. Rawes (Secretary).

No awards were made, but a host of fruits were received for naming. The Bunyard Cup for a seedling Apple was withheld.

NON-COMPETITIVE EXHIBITS.

MESSRS. S. SPOONER AND SONS had a small exhibit of baskets and dishes of Apples, and showed Newton Wonder, Allington Pippin, Royal Jubilee, Charles Ross, Bismarck, Rev. W. Wilks and Guelph Apples in fine condition and good colour.

An attractive display from the BARNHAM NURSERIES, LTD., consisted of brown baskets of Apples and Pears. Among the Apples, a few of the best varieties were Peasgood's Nonesuch, Bramley's Seedling, Ellison's Orange, Charles Ross, Ribston Pippin, Rival, Peacemaker, Coronation and Newton Wonder. Berberis and Rhus foliage was used between the baskets.

Mr. J. C. ALLGROVE had one of the largest exhibits and raised well above his finely-coloured Apples were elegant fruiting sprays of Berberis vulgaris. His arrangement was good, and there were large baskets of Cox's Orange Pippin, Peasgood's Nonesuch, Emperor Alexander, Encore, S. T. Wright (beautifully coloured), Allington Pippin, Gascoyne's Scarlet and Newton Wonder; while Pears were represented by Conference, Souvenir du Congrès, Marguerite Marillat, Doyenné du Comice and Marie Louise; Coe's Violet, President, Wyedale and Coe's Golden Drop Plums were also included, while clusters of the brilliantly coloured hips of Rosa rugosa and R. Moyesii were placed on the table between the baskets of fruits.

MESSRS. G. BUNYARD AND CO. put up a very attractive display consisting of Apples, Pears, Grapes, Nuts, Plums and Crabs. The leading Apples were Upton Pine, Peasgood's Nonesuch, Blenheim Pippin, Bramley's Seedling, Stirling Castle, Lord Derby, Sanspareil, Christmas Pearmain, Autumn Pearmain and Coronation, while attractive Pears were Doyenné Georges Boucher, Conference, Beurré Diel, Doyenné du Comice and Beurré Six. Grapes grown in the cool house were represented by neat little bunches of Buckland Sweetwater, Chasselas Vibert, Madresfield Court, Esperione, Gros Maroc, Strawberry Grape, Black Prince, White Frontignon and Reine Olga de Wurtemberg.

A useful education exhibit was put up by the READING UNIVERSITY COLLEGE, from their gardens, the idea being chiefly to illustrate different methods of packing for market. There were trays with one layer of fruit, bushel baskets

and bushel boxes, half-bushel baskets and boxes, and barrels. In the case of the useful half-bushel boxes, the sides were removed and panes of glass put in their place so that the style of packing could be seen quite easily. The exhibit contained particularly good fruits of Worcester Pearmain, James Grieve, Lord Derby, Coronation, Allington Pippin, Newton Wonder and Wealthy Apples.

MESSRS. J. CHEAL AND SONS exhibited their finely-coloured Apples in white baskets and made up a very attractive display. Particularly fine were their samples of Peasgood's Nonesuch, Warner's King, Rival, Encore, Bramley's Seedling, Crawley Beauty, Lady Henniker, Newton Wonder, Ribston Pippin, Ellison's Orange, Charles Ross and King of the Pippins. A few pot Figs were included and fruiting sprays of Pernettya were placed among the baskets of Apples.

A small exhibit of particularly fine fruits was arranged by Messrs. T. RIVERS AND SONS, who had pot trees of Gascoyne's Scarlet Apples in the centre, with baskets of highly coloured Ribston Pippin, Worcester Pearmain, Wealthy, The Queen, Cox's Orange Pippin, Peasgood's Nonesuch, Washington, King of Tompkin's County and Rival Apples on either side of the trees. Boxes of President Plum were also shown, and Berberis sprays were used for decorative purposes. Messrs. SEABROOK AND SONS exhibit contained capital specimens of Rival, Charles Ross, Monarch, Bismarck, Ellison's Orange and Newton Wonder Apples.

MESSRS. LAXTON BROS., Bedford, had a very bright exhibit in which the Edward Langley Blackberry, a new variety, and the so-called Strawberry-Raspberry were used as a background, while sprays of Berberis were placed between the baskets of Cox's Pomona, Gascoyne's Scarlet, Laxton's Superb, Lord Lambourne, Lord Derby and James Grieve Apples.

The SWANLEY HORTICULTURAL COLLEGE exhibited Apples and Pears in low baskets and used Grevilleas and Berberis sprays for decorative purposes. The leading Apples were Allington Pippin, Newton Wonder, Peasgood's Nonesuch, Bismarck, Loddington, Alfreton and Charles Ross. Messrs. DANIEL BROTHERS contributed a small display of Crimson Bramley, Newton Wonder, Norfolk Beauty, Peacemaker, Herring's Pippin, Charles Ross and Monarch Apples, and large fruits of Pitmaston Duchess, Doyenné du Comice and Santa Claus Pears. The Apples were arranged in baskets with large, coloured leaves of Vitis Coignetiae, and Berberis sprays were placed among the fruits.

Mr. W. J. H. WHITTALL, Grayswood Hill, Haslemere, exhibited a collection of 135 named varieties of Apples grown by him at 600 feet above sea level. LADY HADDON (gr. Mr. Hayles), Berkhamsted, exhibited a dozen dishes of fully ripe Morello Cherries. Mr. H. THOMAS sent, from a West Ealing garden, branches of Conference Pear carrying clusters of eight to ten fruits. Mr. W. TAYLER showed examples of his new Apple named Joy Bells.

MEDAL AWARDS.

Silver-gilt Hogg Medal.—To Mr. J. C. ALLGROVE, MESSRS. GEORGE BUNYARD AND CO., MESSRS. J. CHEAL AND SONS, MESSRS. T. H. RIVERS AND SONS, and the UNIVERSITY COLLEGE GARDENS, Reading.

Silver Hogg Medal.—To MESSRS. LAXTON BROTHERS, Mr. W. J. H. WHITTALL, MESSRS. W. SEABROOK AND SONS, and the BARNHAM NURSERIES, LTD.

Hogg Medal.—To MESSRS. DANIELS BROTHERS, MESSRS. S. SPOONER AND SONS, and the SWANLEY HORTICULTURAL COLLEGE.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

At the meeting held on Friday, October 7, the members of Committee present were Messrs. Hy. Astley Bell (in the chair), J. B. Adamson, R. Ashworth, A. Burns, A. Coningsby, J. McCartney, D. McLeod, W. J. Morgan and H. Arthur (Secretary). Messrs. A. G. Ellwood and J. Thrower were invited to sit with the Committee.

FIRST CLASS CERTIFICATE.

Brasso-Cattleya Jazz.—A fairly large flower of very unusual colouring; sepals and petals orange-red, with a pink tinge; lip round, slightly fringed, orange-yellow, with orange-red lines. From J. B. ADAMSON, Esq.

AWARDS OF MERIT.

Laelio-Cattleya Carmencita var. Bronze Queen; *L.-C. Mrs. T. W. Ward var. Crimson Glory*; *L.-C. Queen Mary var. Sunray*; *Cattleya amabilis var. White Queen*; *C. Princess Royal var. Towneley*; and *Odontoglossum Lilian var. magnificum*, all from J. B. ADAMSON, Esq.

CULTURAL CERTIFICATES.

To Mr. J. HOWES, for *Oncidium incurvum*, and *Cattleya hybrids* in variety; to Mr. A. BURNS, for *Odontoglossums* of the grande section; to Mr. W. J. Morgan, for *Epidendrum vitellinum*; and to Mr. T. W. Potts for *Oncidium ornithorhynchum*.

GROUPS.

J. B. ADAMSON, Esq., Blackpool (gr. Mr. J. Howes), staged a group to which a Gold Medal was awarded. This exhibit included many fine *Cattleyas* and *Laelio-Cattleyas*, *Cypripedium Queen Alexandra*, *C. Nabob*, *C. Bianca*, *C. Leyburnense magnificum*, *C. Madame A. Fevrier*, *Oncidium incurvum* and *Miltonia Bleueana grandiflora*. Mrs. BRUCE and Miss WRIGLEY, Bury (gr. Mr. A. Burns), were awarded a Large Silver Medal for a group of well-grown plants of *Odontoglossum grande* in variety.

Captain W. HORRIDGE, Bury (gr. Mr. A. Coningsby), showed *Cattleya Fabia alba*, *C. labiata var. Prince of Wales* and *C. Mantinii nobilior*. H. J. BROMLOW, Esq., Rainhill (gr. Mr. W. J. Morgan), staged a specimen plant of *Epidendrum vitellinum*. J. MCCARTNEY, Esq., Bolton (gr. Mr. T. W. Potts), exhibited *Oncidium ornithorhynchum*.

MESSRS. SANDERS, St. Albans, staged a group to which a Large Silver Medal was awarded; *Cattleya Fabia var. Arethusa* and *C. F. sanguinea*, *Odontonia Brugensis*, *Oncidium tigrinum* and *O. praetextum*, *Vanda coerulea* and *V. Kimballiana*, were all included.

MESSRS. CHARLESWORTH AND CO., Haywards Heath, showed *Odontoglossum crispum var. Caliph*, *O. Eudora*, *O. Porthos* and *O. Reve d'Or*. Mr. D. McLEOD, Chorlton-cum-Hardy, showed *Cypripedium Reginald Young* and *C. Germain Opoix*, West Point var.

GLASGOW AND WEST OF SCOTLAND HORTICULTURAL.

THE winter series of lectures was inaugurated on Wednesday, the 21st ult., when Mr. David Torrance, Busby, addressed a largely attended meeting, on "Dahlia Culture." Mr. Thomas Dagg, who presided, announced that on the occasion of the recent show the receipts at the door amounted to £580 17s. 6d., an increase of £64 on last year.

Mr. TORRANCE exhibited a large collection of Dahlias, consisting of ninety-seven varieties, from his nursery at Busby, and Awards of Merit were given to the dwarf seedlings, Elsie and Purity, while Busby Gem received a First Class Certificate.

Obituary.

R. Johnson.—We regret to learn of the death of Mr. R. Johnson, who was Superintendent of the Tottenham Parks and Open Spaces for about twenty-five years, and only resigned from that position about two years ago. Mr. Johnson laid out the Chestnuts Recreation Ground, and made Bruce Castle Park one of the prettiest places in north London. He was an ardent supporter of the Stoke Newington exhibitions, general adviser to the local allotment holders, and a keen bowler.

ANSWERS TO CORRESPONDENTS.

AGREEMENT FOR LAND AND HOUSING ACCOMMODATION.—A. E. L. The agreement is not duly stamped as, in view of the rent, it was liable to a duty of £1. This does not however affect the validity of the document, but prevents it being produced in evidence in Court until the proper stamp duty and penalty has been paid, also a Court fee. You do not give the date of the agreement, but if the tenancy is not prosecuted by the Rent Restriction Act and the proper notice to determine the agreement has been given, and ignored, you should proceed in the County Court for ejectment.

APPLES DISEASED.—W. V. Your Apples are affected by scab disease, caused by the fungus *Venturia inaequalis*. Syringe the trees this winter with a solution of sulphate of iron and next spring, spray with diluted Bordeaux mixture, just when the buds are beginning to open, again when the petals are falling from the flowers and a third time when the young fruits are about the size of Peas.

CARNATION LEAVES DISEASED.—H. G. Your Carnations are suffering from a rather bad attack of leaf disease, caused by the fungus *Septoria dianthi*. As the trouble is liable to spread rapidly, all infected leaves should be removed and the plants sprayed with a solution of potassium sulphide. The disease attacking your Tomatos is probably *Cladosporium scabiei*, but, of course, we cannot tell without seeing specimens.

CONIFERS DISEASED.—W. M. C. The specimens received for examination were not large enough to enable us correctly to identify the disease attacking your Pine trees, but there were indications that the shoots may have been injured by one of the Pine Shoot Tortrix Moths (species of *Retinii*). Injured shoots usually wilt and die towards the end of summer. All that can be done in the case of this pest is to collect and burn infected shoots during early summer, before the end of the pupation period, which is usually in June.

CREOSOTING TREE STAKES.—J. W. If you treat the stakes with creosote and allow them to dry for a few days before driving them into the ground, they are not likely to cause injury to the trees. If you apply the creosote with a brush it would be advisable to give two or three dressings at intervals of a few days.

CYANIDE FOR THE DESTRUCTION OF WHITE FLY AND MEALY BUG.—R. G. For tender plants, such as Begonias, one ounce of sodium cyanide, one-and-a-half fluid ounce of sulphuric acid, and five fluid ounces of water should be used for every five hundred cubic feet of space, care being taken to fumigate during the evening, after having kept the plants on the dry side for a day or two. For a vinery, where the vines are at rest, the above quantities should be used for every two hundred cubic feet of space. Full particulars for cyaniding were given in our issue for November 22, 1924, p. 362.

MELON SEEDS GERMINATING INSIDE THE FRUIT.—N. McM. Although not a matter of frequent occurrence, the germination of seeds inside the fruits of Melons and Vegetable Marrows has been recorded on numerous occasions, and it appears to occur most frequently when the fruits are a long time coming into maturity, and when a burst of warm weather comes at a late period, or, in the case of Melons, when extra artificial heat is used to bring the fruits to maturity. An excess of moisture at the roots may also have some influence.

NAMES OF PLANTS.—H. M. 1. Bramley's Seedling; 2. Pear's Pippin; 3. not recognised; 4. Hornsea Pearmain; 5. Allington Pippin; 6 and 38. Ribston Pippin; 7. Royal Russet

(syn. Leather Coat); 8 and 16, Dumelow's Seedling (syn. Wellington); 9, not recognised; 10, Ashmead's Kernel; 11, Bismarck; 12, Belle de Pontoise; 13, White Nonpareil; 14, Reinette du Canada; 15, Small's Admirable; 17, Lane's Prince Albert; 18, Lord Suffield; 19, White Westling; 20, Durondeau; 21, Cellini; 22, Hawthornden; 23, Margaret Marillat; 24, Napoléon III; 25, not recognised; 26, Beurré Sterekinans; 27, Beurré Bosc; 28, not recognised; 29, 31 and 37, Louise Bonne de Jersey; 30, not recognised; 32, Autumn Bergamot; 33, Beurré Hardy; 34, Beurré Diel; 35, Clapp's Favourite; 36 and 39, not recognised; 40, Jalousie de Fontenay; 41, Pitmaston Duchess; 42, Van Mons Léon Leclerc; 43, Vicar of Winkfield; 44, Williams's Bon Chretien; 45, Glou Morceau; 46, Catillac; 47, Beurré d'Amanlis. —R. J. 1, Winter Strawberry; 2, Bramley's Seedling; 3, Sturmer Pippin; 4, Nonesuch; 5, American Mother; 6, Calville St. Sauveur; 7, Bachelor's Glory; 8, Flower of Kent; 9, Newton Wonder; 10, Stirling Castle. —W. A. L. Apple Cox's Orange Pippin; Pear Marie Louise. Apple Belle de Pontoise is classed as a culinary variety. —C. H. 1, Nanny; 2, Hanwell Sourcing; 3, Chelmsford Wonder; 4, Anne Elizabeth; 5, Newton Wonder; 6, Lemon Pippin; 7, Margil; 8, Scarlet Nonpareil; 9, Old Nonpareil; 10, Gozar Pippin (syn. Stone Pippin); 11, Easter Pippin; 12, Cellini. —R. H. J. 1, Emperor Alexander; 2, Stone's (Loddington); 3, Lord Burghley; 4, Lane's Prince Albert; 6, Small's Admirable. —C. A. Apple Margil. J. E. A. Probably James Grieve.

NAMES OF PLANTS.—A. C. 1, Sphacele Lindleyi; 2, Feijoa Sellowiana; 3, Abutilon megapotamicum (syn. A. vexillarium); 4, Abelia floribunda; 5, A. longituba; 6, Leptospermum scoparium; 7, Lonicera species, probably L. sempervirens; 8, Correa alba; 9, Olearia nummularifolia. —Mrs. H. C. Conifer: Cupressus pisifera var. filifera; Tree: Acer campestre. —E. J. Abelia rupestris. —J. B. P. Specimens very scrappy for identification, but they appear to be forms of Linaria purpurea. —E. C. V. G. 1, Berberis species; 2, Ceanothus Gloire de Versailles; 3, Polygonum species, probably P. compactum; 4, Aralia chinensis; 5, Euonymus latifolius; 6, Phytolacca decandra; 7, Salvia Horminum. —E. W. D. 1, Tecoma grandiflora; 2, Leycesteria formosa; 3, Lythrum Salicaria variety. —H. F. T. 1, Alchemilla laciniata; 2, Ligustrum coriaceum; 3, Prunus Padus (Bird Cherry); 4, P. cerasifera (Myrobella). —C. H. Ulmus viminalis. —A. P., Claygate. 1, Mentha Pulegium; 2, Chlorophytum elatum; 3, Berberis vulgaris; 4, Amelanchier canadensis; 5, Cornus Mas; 6, Platanus acerifolia; 7, Cupressus pisifera var. squarrosa sulphurea; 8, Cupressus Lawsoniana var. aurea; 9, Larix sp. —A. B. H. A form of Salvia Przewalskii, but the under sides of the leaves are more woolly than usual. —E. W. 1, Veronica repens; 2, V. Lyallii; 3, send when in flower; 4, Polomonium caeruleum; 5, Anthericum Liliago. —A. W. G. Impatiens Roylei. —C. A. Polygonum affine. —W. F. H. Schizostylis coccinea.

PEACHES AND GRAPES.—J. S. The Peach sent for naming was decayed at the base, at the crown and around the stone, which made it impossible to name it correctly. We certainly do not think it is Dymond; it is more like Princess of Wales in the colour of the flesh, and the leaves, with round glands, are like those of that variety. Neither Dymond nor Princess of Wales should be bitter; both are highly-flavoured varieties. Give the border a dressing of slaked lime in the autumn and use more potash when feeding the trees next spring. Insufficient water at the roots over a long period would cause roots to grow down into the subsoil, and this, with over-cropping, would cause the stones to split and the fruits to be of poor flavour. Partially lifting the trees and bringing the roots nearer to the surface, adding plenty of lime-rubble and a fair sprinkling of bone-meal to the soil,

would result in increased fertility of the trees and improve the quality of the fruits generally, as, apparently, your cultural methods are all that can be desired. The wet season may have contributed to the splitting of your Madrasfield Court Grapes. Always maintain a little warmth in the water-pipes and a constant circulation of warm air from the time the berries commence to colour. Do not withhold water and atmospheric moisture suddenly and you should not be troubled further with cracking.

TULIPS FOR PLANTING AN ELLIPTICAL BED.—Miss C. You give no indication as to what colours you require, whether you prefer the strong, or softer shades. You may plant the bulbs six inches apart, and will require in all about 750 bulbs. Here again we are at a loss, as you do not state how wide the edging of Crocuses is to be. As the position is exposed, it would be wise to use only the dwarfier-growing Tulips. If you like scarlet or red shades, you could use Glow for the outer planting, then Isis, with William Pitt or Bartigon, for the centre; all these sorts grow about two feet tall. If you prefer a taller variety for the centre you can use Farncombe Sanders. If you like the softer rose and pink shades, Clara Butt, White Queen and Margaret may be planted in the centre, using White Queen next to the Crocuses. A mixed planting of Clara Butt, Loveliness, Rev. Ewbank and Suzon is very beautiful and has been much admired. All the above are Darwin varieties; if you prefer the Cottage varieties you could try Picotee for the outside, followed by Inglescombe Yellow and Inglescombe Pink in the centre, or if you like a stronger colour you could plant Gesneriana major in the centre. Some of the varieties with brown, bronze and orange shadings are very beautiful, such as Dom Pedro, Panorama and Prince of Orange.

REGISTERED PLANT NOVELTIES.

THE following plants have been registered with the Federation Horticole Professionnelle Internationale:—

Rose Distinction.—Polyantha, dwarf (remontant); a fixed sport from Joseph Guy; flower of similar size; colour rose neyron red, turning to deep rosy-pink. Raisers, MM. E. TURBAT ET CIE., 67, Route d'Olivet, Orleans.

Rose Marie Gouchault.—Hybrid of Wichuriana and multiflora; light red, turning to salmon-pink flowering three weeks before Dorothy Perkins; good for forcing. Raisers, M.M. E. TURBAT ET CIE.

Rose Tis Blanc.—Polyantha, Dwarf, clusters of twelve to fifteen flowers, large for the section, pure white, centre suffused with cream. Raisers, MM. E. TURBAT ET CIE., Orleans.

Rose Seduction.—Dwarf, clusters of fifty to sixty flowers; very lasting; Peach-blossom colour. Raisers, MM. E. TURBAT ET CIE., Orleans.

Rose Madame Delmas.—Very vigorous, large foliage; colour cherry-red; very scented; keeps well and does not get blue. Raised by M. GEYER PIERRE, Manager, La Roseraie de St. Jean, Antibes, and offered for sale by Dr. Delmas, La Roseraie de St. Jean, Antibes.

Rose George Perdoux.—A H.T. variety suitable for grouping. Flowers light copper and carmine, in bunches of five or six. Raised and offered by MM. BARBIER ET CIE., 16, Route d'Olivet, Orleans.

Rose Marie Menudel.—Flowers single, on long and strong stems. Colour similar to that of Her Majesty, with a lemon-pink centre. Good for forcing. Raised by MM. BARBIER ET CIE.

Sambucus nigra splendens.—Large foliage with golden-yellow markings; very consistent. Raised by MM. BARBIER ET CIE.

MARKETS.

COVENT GARDEN, Tuesday, October 11th, 1927.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Tuesday by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market and the demand, and they may fluctuate, not only from day to day, but occasionally several times in the day.—EDS.

Plants in Pots, etc.: Average Wholesale Prices.

REMARKS.—Amongst Chrysanthemums there is still a limited supply of good quality blooms, and all bunches are well supplied. The market is generally well supplied with all the principal varieties of cut flowers, and the prices are generally well maintained. The market is generally well supplied with all the principal varieties of cut flowers, and the prices are generally well maintained.

Crawford, Liberty, Richmond and Roselandia. Amongst the Liliums, L. speciosum album and L. s. rubrum are the shortest supply and much below requirements. L. longiflorum remains unchanged in price owing to a more regular supply. A few L. auratum are still available, but there is little demand for them. Arum (Richardias) are becoming more plentiful and show a general improvement in quality. Owing to a short supply of Stephanotis and Lapagerias, Camellias are selling more freely. A small consignment of scarlet Nerines was received from Guernsey during the week. The first consignment of Parma Violets arrived on Saturday last from the south of France. Single Violets are increasing in quantity almost daily and are of finer quality and prices are on the down grade. Amongst Orchids, Cypripediums are more plentiful and a few more Cattleyas have been offered during the week.

REMARKS.—Some improvement is noticeable in the general demand in most sections. Quantities of English Apples show a considerable decline and better values are ruling for the best Worcester Pearmain. Cox's Orange Pippin is rather more plentiful but shows much variation in quality. Although large cooking Apples are comparatively scarce, there are as yet no high prices, even for the finest samples. Hothouse Grapes have come along in large supply, mainly from the Channel Islands, and are quoted at reasonable prices. Peaches sell at high prices for perfect specimens. English Pears are only in moderate demand, but fairly good figures are ruling for choice varieties. Apples from the North American continent are reported as being on the scarce side, and available supplies sell fairly well. Pears from California, and Oranges also, meet a popular demand and generally arrive in good condition. Mushrooms increase in supply almost each day, but a satisfactory price level is being maintained. Tomatoes sell well if the fruit is of the new crop; old crop Tomatoes are difficult to sell. Jersey is sending Tomatoes rather heavily, but well-finished fruits are selling readily. The Cucumber trade is moderately good. The Guernsey Bean trade continues a little unstable, prices showing

some fluctuation for similar produce from day to day. Salads are improving. Old Potatoes are in firm demand and selling well.

GLASGOW.

Improved conditions prevailed in the cut flower market especially during the last three days of the week, when a larger volume of business was done at firm prices. As the result of the good weather, Chrysanthemums were plentiful and disbudded blooms were readily disposed of at the following values: Debutante, 2s. 3d. to 2s. 6d. for 6's; Crawford Yellow, 2s. to 2s. 6d.; Pink Delight, 1s. 6d. to 1s. 9d.; Harvester, 1s. 3d. to 1s. 4d.; Sanctity, 1s. 4d. to 1s. 6d.; and Aleale, 2s. 6d. to 3s. for 12's; white sprays made from 6d. to 8d. for Holmes' White; Polly, 3d. to 7d.; Abercorn Beauty, 3d. to 6d.; McAlpine, 4d. to 5d.; Dolores, 1s. to 1s. 3d.; Phoenix, 1s. 2d. to 1s. 4d.; and Betty Spark, 1s. to 1s. 3d. Carnations were worth 2s. 6d. to 3s. per dozen; Pink Roses, 2s. to 3s. 6d.; red, 2s. 6d. to 3s.; Lily-of-the-Valley, 2s. per bunch; Lilium Harrisi and L. speciosum rubrum, 2s. to 2s. 6d.; Calendula, 2d. to 4d.; Smilax, 1s. to 1s. 6d.; and Asparagus, 9d. to 1s.

A feature of the fruit market was the further sharp advance in the price of Apples. British Columbia Jonathan averaged 20s. per case; Wealthy, 14s. to 16s. 6d.; Nova Scotia Gravenstein (No. 1), 2s. to 3s. per barrel; (No. 2), 2s. to 2s. 6d.; Dudleys (No. 1), 2s. to 2s. 6d.; York Imperial, 2s. to 2s. 6d.; Ruperor and Wolff River (No. 1), 2s. to 2s. 6d.; (No. 2), 1s. 8d. to 2s.; Blenheim, 2s. to 2s. 6d.; Porto Rico Grape Fruit realised 32s. per case; South African Oranges, 1s. per case; Sunkist ditto, 2s. to 2s. 6d.; Magnifique Pears, 14s. per half-case; Beurre Hardy 15s.; Pomegranates, 11s. 6d. to 14s.; Smyrna Figs, 8s. per 10 lb. box; Canadian Peaches, 10s. per case of 28 and 32; Pineapples, 4s. 6d. to 5s. 6d. each; White Grapes, 3s. per lb.; black, 1s. to 1s. 6d.; Victoria Plums (table quality), 8d. to 10d.; (cooking), 4d. to 5d.; Murcia Lemons, 40s. to 42s. per case.

Tomatoes were dearer at 8d. to 10d. per lb.; Mushrooms, 3s. 6d.; Cucumbers, 2s. to 6s. per dozen; Lettuce, 1s.; Cauliflower, 3s. to 7s.; and Brussels Sprouts, 3s. 6d. per bag of 21 lbs.

THE WEATHER IN SEPTEMBER.

The protracted spell of wet weather was continued in an intensified form all through the month. The normal rainfall for the district is under 2½ inches, but the huge total of 9·23 inches fell during the month. September 6 yielded a rainfall of over one inch. Sunshine also was under the average though only to the extent of half-an-hour daily, the total for the month being 91·8 hours. The temperature was higher than the average and gave an actual mean of 51°. The highest maximum temperature of 69° occurred on the 1st, and the lowest—39°—on the 27th. The lowest grass minimum was 17° on the 27th, and that also was the only night of ground frost. The soil temperature at one foot deep fell from 58° to 48° during the month. Barometric readings were generally low. The highest reading of 1027 millibars was obtained on the 3rd, and the lowest, 980 millibars, on the 24th. William McClelland, Meteorological Station, St. Andrews Training College Gardens, Mayfield, Dundee.

GARDENING APPOINTMENT.

Mr. W. Wynn, for the past four years gardener to Colonel G. S. SPURRIER, D.S.O., Luerns House, Goring Heath, Oxon., and previously five years gardener to H. WALLIS, Esq., at the same place, as gardener to The Hon. ALGERNON BORTHWICK, Woodcote House, Woodcote, Oxon. (Thanks for 1s. 6d. for R.G.O.F. Box.—EDS.).

SCHEDULES RECEIVED.

DERBYSHIRE HORTICULTURAL ASSOCIATION.—Twentieth Chrysanthemum Show to be held at the Royal Drill Hall, on Thursday, Friday and Saturday, November 3, 4 and 5.—Secretary, Mr. W. Wardman, 5, St. Augustine Street, Derby.

IPSWICH AND DISTRICT GARDENERS' ASSOCIATION.—Exhibition to be held in the Corn Exchange, on Thursday, November 10.—Secretary, Mr. R. Ball, 39, Withington Street, Ipswich.

CATALOGUES RECEIVED.

R. GILL AND SON, Himalayan Nurseries, Penryn, Cornwall.—Himalayan, Chinese and other Rhododendrons, etc.

BARR AND SONS, 11, King Street, W.C.2.—Flag Irises.

T. RIVERS AND SON, LTD., Sawbridgeworth.—Fruit Trees, Roses, shrubs and hardy perennials.

E. P. DIXON AND SONS, LTD., Hull.—Nursery Stock.

Foreign.

SLUIS EN GROOT, Enkhuizen, Holland.—Vegetable seeds.

L. SPATH, Berlin-Baumschulenweg.—Nursery stock.

ERNST BENARY, Erfurt, Germany.—Novelties.

SUPPLEMENT PLATE.

Pancratium illyricum.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 47.5.

ACTUAL TEMPERATURE—The Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, October 19, 10 a.m. Bar. 29.9°. Temp. 55°. Weather, Dull.

Strawberry Cultivation

(i).

EVERY gardener who grows Strawberries should read the article in the *Journal of the Ministry of Agriculture*,* summarising the investigations carried out by Messrs. Ball, Mann and Staniland at the Long Ashton Research Station. The investigations are not only valuable in themselves, but they provide a model of what investigations devoted to horticultural ends should be. The problem which offered itself for investigation was the serious fall in yield which has characterised the Strawberry crop in recent years. Whereas in years gone by two tons to four tons of fruit to the acre used to be obtained the yield now is little or no more than fifteen hundredweights. It is easy to guess at the causes of this large reduction, but to find out the truth of the guess must needs be a laborious process. This the authors recognised and proceeded to the enquiry. Sundry explanations have been advanced from time to time to account for the falling off in yield. The land becomes Strawberry sick! Varieties propagated vegetatively for many generations undergo a natural deterioration! The Strawberry plant, like the Potato, falls a victim to one of the

obscure virus diseases which works its sterilising way gradually and progressively!; or else the war is responsible! When more food had to be grown, County agricultural authorities often issued edicts against the growing of Strawberries. The area under cultivation was restricted; and so when peace came there were not enough good plants to supply the demand for runners, hence the quality of supply deteriorated! Lastly the Strawberry aphid, which is known to attack the plant, may be a more serious pest than is generally considered. This more or less exhausts the guessing process, and having given, and rightly given, rein to conjecture, the authors proceeded to set about testing the various hypotheses. But before doing so they decided to learn something about the Strawberry plant itself. This was wise, for we do not know the detailed life history of any plant. Careful and prolonged observation on the growth and development of the Strawberry resulted in a valuable addition to knowledge and one, moreover, which must form the only secure basis for any final conclusions with respect to the cause of the falling off of yield and the means of restoring the Strawberry to its pristine prolificness. The observations were made on upwards of 1,000 plants of Royal Sovereign, planted at Long Ashton on September 2, 1924, and lifted in batches of ten, at intervals of from three to six weeks during the next two years. These observations show that no sooner is a runner planted than the root-system begins to develop. Strong laterals are thrown out from the main roots, and white roots are produced adventitiously from the crowns. The crowns themselves do little during these autumn months (September to December). Then the plant becomes dormant. But by February it begins to become active again. By March, more fine lateral roots have been produced from the autumn-formed roots. By the end of April these fibrous roots are numerous and are, of course, all important as the organs of supply. They are therefore properly called feeding roots. In the meantime the crown has grown, three or four new leaves having been formed, and the flowering trusses are also partially developed. During May and June the old roots turn brown and black. This, however, is not a sign of death. It is due to cork formation as a result of which the outer layers are cast off and new tissues, which are to serve as starch-storing organs, are formed beneath the corky layers. Nothing of particular interest happens to the roots till mid-July. At that period, however, a new phase of root development begins. Right and left of the leaf base of the earliest leaves new roots appear. They must have encouragement, for on their growth must depend that of the whole plant. After they have formed, new foliage arises and daughter crowns appear. The July-formed roots grow vigorously in August, and the daughter crowns also produce new roots. As the year wanes, this post-cropping root development gradually ceases. So much for development: next, it was necessary to determine the distribution of the roots. Careful investigation showed that the Strawberry is a remarkably surface-rooting plant. One-quarter of the total root system is confined to the top inch of soil, and three-quarters of the whole root system lie within the top three inches; seventeen per cent. lie between the third and sixth inch of soil, and a few roots straggle so deeply as thirteen inches to sixteen inches. These facts of periodicity of growth and superficiality of distribution give the gardener information on which he can

act. They provide the basis for the kinds of cultivation and fertilisers which he must use and also indicate the time at which they must be applied. Here the first part of the investigation ends. We will conclude an account of the second part in the near future.

Pancratium illyricum.—"A native of Sicily, Corsica, Spain and Sardinia; Morison says he found it near Rochelle, buried very deep in the sand of the sea-shore. Thrives in the open ground when placed close to the foot of a wall in a dry southern border; so do *Amaryllis vittata*, *belladonna* and *formosissima*, as we have seen at the Nursery of Messrs. Grimwood and Wykes, Kensington, where our drawing was taken. In *Hort. Kew.* it is mentioned as a greenhouse plant, but we never found it succeed with that treatment. Is generally mistaken among the nurserymen for *Pancratium maritimum*, a plant we have not yet found in bloom in our gardens. The bulbs of our species are often imported from Holland with those of the Hyacinth. Cultivated by Parkinson in 1615." This quotation from the *Botanical Magazine* (t. 718), February 1, 1804, is ample proof that *Pancratium illyricum* is a very old cultivated plant; nevertheless, it is still uncommon even in those gardens where the less popular, but no less beautiful plants are grown. The white, fragrant flowers are freely produced when the bulbs are established in a warm, well-drained border, and as the leaves die down before winter there is no need for elaborate protection. The plants illustrated in the Supplement Plate that accompanies this issue were very beautiful when we saw them in May, flowering in a narrow border outside one of the glasshouses at Oxford Botanic Garden—where Mr. W. G. Baker cultivates many interesting plants with great skill and success.

Preservation of London Squares.—A large scheme for the preservation of no fewer than four hundred squares and similar open spaces in London is being considered by a Royal Commission that has already held one meeting at the House of Lords. This Royal Commission proposes to hold further meetings in public, and about four weeks hence will receive evidence from the London County Council.

The School Garden and its Place in Education.—The teaching of biology in schools seems at last destined to come into its own. This was one of the many important lessons brought out when the Imperial Social Hygiene Congress met in the first week of this month under the auspices of the British Social Hygiene Council, at the Caxton Hall, Westminster. The Rt. Hon. W. Ormsby-Gore, Parliamentary Secretary for the Colonies, when addressing the Congress on "Colonies, Protectorates and Mandated Territories," complained that children in their early days were taught very little science, and then they were nearly always taught chemistry and physics. Biology very rarely appeared in the curriculum, and yet this was probably the most important subject for mankind, as it affected men, animals and plants. Unless, he said, a wider grasp of the significance of biology was attained, it would be difficult to get the policy of personal and social hygiene carried out. What was wanted was to develop a biological conscience which should concern itself with such questions as the laws of nutrition and so forth. During the same Congress the whole problem of biological teaching was considered by Dr. W. K. Spencer, of the Board of Education, both in the widest meaning of the term and as it applied directly to the study of plants and animals. He pointed out how the Board of Education had recently revised their "suggestions for the consideration of teachers" in the public elementary schools. The science teaching was now definitely linked with that on health, and the Board had pointed out that amongst the minimum content of knowledge essential to an understanding of everyday occurrences was that obtained by an elementary study of the conditions for the healthy growth of animals and plants. This, as he said, can only be satisfactorily carried out by observations

upon the living organism, and, therefore the old object lessons are replaced, to a large extent, by activities in the case of the younger children who can assume definite responsibilities for looking after the animals and plants kept indoors. They wash the flower vases and arrange flowers brought to school or obtained from the garden; they prepare seed-pans and window-boxes; they make simple plant-labels, sow seeds, set up germination experiments, change the water in the smaller aquaria and feed the tadpoles, sticklebacks and other forms of pond life. After showing that it is a comparatively simple matter to study the elements of physiology by means of plants, Dr. Spencer continued:—"A very important factor in this training is the growth in the number of school gardens. Observations in natural history can often be carried out far more conveniently in the school garden than on country walks, and the cultivation emphasises the necessity of continuous care. It is customary for both boys and girls to take a part in the care of the garden, and an endeavour is usually made to make it more beautiful as well as utilitarian. Experimental science in co-ordination with the garden fits well within a normal biological course." Professor Winifred Cullis told a dreadful story of the way in which the biological sciences have been treated in the past. She was once asked to examine a group of physical training experts for a diploma of Physical Training and Physiology. Five questions were set in Physical Training and four in Physiology, only two of which were compulsory. Many of the physiology answers were so bad that she could give no marks, but the answers in Physical Training were so good that the candidates were awarded the diploma in Physical Training and Physiology. Her protests, she said, were so violent that she was never asked by that college to examine again. That the Imperial Social Hygiene Congress was unanimous in insisting on the study of biology as the basis of hygiene and that delegate after delegate insisted that it must be treated as a serious subject, is all to the good. A knowledge of the habit and growth of plants undoubtedly is helpful to an understanding of hygiene, but the call of botany and the call of gardening are so clamant that if they are taught with sympathy they will never be tied to the chariot wheels of even so adorable a mistress as Hygiene. If the schools teach botany as a living subject and not in the dry-as-dust spirit of the old grammarians, it will claim its own votaries. Many, if not most, of the school teachers are fired with enthusiasm and are encouraged to work out their own methods.

Ken Wood, Hampstead.—By the will of the late Lord Iveagh, who purchased seventy-four acres of the Ken Wood estate, Hampstead, including the mansion, some years ago, this property is to be added to the portions already acquired for the use and enjoyment of the public. It is not known how soon this bequest will become effective, but when it does, the whole of Ken Wood Estate will have been saved for the nation. In November, 1924, when the greater part of the estate was purchased out of funds raised by the Ken Wood Preservation Committee, it was greatly feared that it would be impossible to prevent the remaining portion from being built over. Lord Iveagh's generous and public spirited action in purchasing the remainder himself, with a promise that it should be handed over for public use at the expiration of ten years, set these fears at rest. The portion of Ken Wood which came under the aegis of the London County Council in 1924-5 has been dealt with in a capable and sympathetic manner, and is enjoyed by many thousands of the public every summer. The woodland, which is one of the few remaining portions of the ancient Middlesex forest, has been fenced in for protection from damage, but not in an unsightly manner; the ducks and swans which nest on the lakes are protected from annoyance by light iron railings, and one of the lakes has been made suitable for a bathing pool for girls and women, by whom it is used freely. It will be interesting to see what use is eventually made of the Adam mansion which stands in a commanding position on the slope of the hill overlooking the grounds. Its demolition would

certainly detract from the interest of the estate, and it would appear preferable to use it, if possible, as a refreshment house, in the same manner as Lauderdale House in Waterlow Park, and the Golders Green mansion.

Mr. Allan Falconer.—One of the most successful of modern exhibitors is Mr. A. Falconer, who began his gardening career in 1897 as an apprentice to a nurseryman and florist at Lyndhurst, in the New Forest, where he stayed two years, subsequently moving on to Bryanston Hall, Blandford, where he worked in all the departments before serving for two years as journeyman under Mr. Pilgrim, at Bodorgan Hall, Isle of Anglesey, where he gained a large and varied experience with stove and greenhouse plants and indoor fruit culture. After leaving Bodorgan, Mr. Falconer served temporarily in Messrs. Dickson's nurseries at Chester, and then became journeyman under Mr. Metcalfe, at Headfort House, County Meath. He remained in Ireland for one year and then became journey-

MR. A. FALCONER.

man under Mr. Sanders, at Halton Park, Tring, where, it is interesting to recall, the late Mr. Alfred Rothschild required ripe Figs for Christmas Day. After a stay of three years at Halton, Mr. Falconer became decorator to Lady Hollenden, at Hall Place, Kent, where he stayed for one year. His next post was that of outside foreman under Mr. David Gibson, at Ford Manor, Lingfield, where, at that time the gardens were being reconstructed, a new range of glass erected and a golf course laid down. It was at Ford Manor that Mr. Falconer gained his special knowledge of growing vegetables for exhibition. Eventually he became gardener to the late Major J. J. Joicey, Poulton Priory, Fairford, but war broke out and he became a signaller in the Royal Garrison Artillery, and saw plenty of fighting in France. After a period in hospital, he was demobilised and returned to Poulton Priory, but soon afterwards commenced business on his own account; this, however, did not appeal to him, and in February, 1922, he took charge of the garden at the Cheadle Royal Mental Hospital, Cheshire, which at that time had been neglected. However, with every assistance from the Committee and Dr. Roy, the Medical Superintendent, who gives Mr. Falconer every encouragement, this garden has become one of the finest and most up-to-date in the country. Mr. Falconer has made the garden worthy of the Hospital, and produces vegetables, fruits, plants and flowers for the sole use of the patients—a very big task considering the state of the ground. Mr. Falconer tackled his problems in such a methodical manner that not only is he able to supply the Hospital with garden produce all the year

round, but his many alterations and improvements in the pleasure grounds have tended to improve the health of the patients. Mr. Falconer has become one of our leading exhibitors at the big shows, and during the present season has won several Cups and over one hundred prizes for plants, flowers and vegetables.

German Horticultural Officials in Council.

The annual Conference of the German National Association of Horticultural Officials took place this year at Hamburg, in the Town Hall. The Conference was very enjoyable, largely owing to the fact that Hamburg and Altona contain so many features of horticultural and gardening interest, of which not the least was the display of hardy flowers at the nurseries of Nonne and Höpker. Many subjects were discussed, including horticultural education and examinations, protection of the interests of horticultural state-employees, the growth of the Association, and of its press. Two papers were also read, one by Professor Dr. Reh on the plant diseases prevalent in Hamburg, and the other by the chief inspector of gardens, Heer C. Goebel, on the gardens of Hamburg. The 1928 annual conference will be held in south Germany.

Flower and Garden Pictures.—A two-fold exhibition of paintings was opened at Colnaghi's Galleries, in New Bond Street, on October 14, comprising landscapes and flower pieces by George Thomson, and thirty-five paintings by various well-known British artists, including Augustus John, Sir William Orpen and Sir John Lavery. The Thomson paintings were in oil, but differed greatly from most modern oil-work, being produced by a special process worked out by the artist himself, which is strongly reminiscent of the effects produced by early Italian painters. The process lends itself remarkably well to the production of delicate flower colours, and some of the pieces—notably Begonias (5); Camellias, a warm shade of pink, arranged loosely in a jade jar (13); and a dish of fruit, were especially effective. Apart from flower paintings, one of the portraits, of a Basque peasant girl, was unusually treated, the light having been thrown on the side of the face in such a way that nearly all the features were in deep shadow. A Window in Samer (23), taken from the inside of a room, the bright sunlight from outside touching a vase of homely flowers on the sill and throwing into relief the houses in the road, was essentially a picture that could be lived with. Of the miscellaneous works, Paeonies and Delphiniums, by H. Davis Richter, was well executed. Hyde Park, by Stephen Bone, was somewhat etherealised; it is doubtful whether the colouring would be so clear on an autumn day, though the evidences of sky and trees suggest wind. Gardens on the Loire (Charles Cundall) is photographic, but pleasing, and shows the usual mixture of orchard, flower garden and closely-cultivated kitchen garden so dear to the heart of the French peasant. Algernon Newton's November Dawn, Waterloo Bridge, is only too true to life.

Seedling Potato Trial at Ayr.—Scientific and trade interests were well represented at Alloway on the occasion of the annual demonstration of seedling Potatoes raised by Messrs. McGill and Smith. Included in the company were Messrs. A. Main, A. Miller, M. Dickie and G. Gilray, of the Board of Agriculture, and Messrs. D. G. O'Brien, R. M. Laird and E. C. Macnaughton of the West of Scotland Agricultural College. Upwards of one hundred seedlings were arranged in a field for inspection. They were planted on May 20, in drills twenty-seven inches apart, on land which had manure ploughed in last autumn and received a dressing at planting-time of 6 cwt. superphosphate, 2 cwt. sulphate of potash, and 1½ cwt. sulphate of ammonia per acre. With the object of ascertaining the opinion of their guests regarding the merits of the seedlings, the firm invited the company to select by a card vote the best ten varieties in the trials. When the poll was declared it was found that a seedling obtained by crossing the new early variety Herald with Arran Comrade was placed first with a total of 322, while Doon Star, a maincrop variety, which is one of the candidates for registration this year was second with 218. The winner is a first-year

seedling which produced 7 lbs. of shapely tubers per root, equivalent to 28 tons per acre. Three seedlings of British Queen and Herald parentage occupied third, fourth and fifth places, while the product of a Great Scot-Herald cross was seventh on the list. At the conference which followed the luncheon, Mr. J. F. McGill expressed the opinion that the pedigree should be given of all Potatos registered with the Board of Agriculture. Mr. Main observed that the standard of stock-purity in the Scottish seed Potato trade was higher than it had ever been and higher than was ever anticipated, while the purity of the tubers that went to England was beyond reproach. That in itself was something to be proud of, while so far as marketing Potatos was concerned, they had advanced further than any other class of agriculture. The next step was soundness. They wanted a Potato that was highly resistant to disease; indeed, they were endeavouring to go further and find out more of the incidence

Richmond (Surrey) Gardens and open spaces, the Mayor of the Royal Borough presented Mr. Skelton with a gold watch on which were engraved the borough arms and "Boro. Richmond (Surrey), Mr. Edward Skelton, Borough Gardener 1891-1927." Mrs. Skelton was given a handsome gold brooch. The staff of the Terrace Gardens gave Mr. Skelton a gold albert watch-chain, and on behalf of the Richmond Municipal Officers' Association, the Borough Treasurer presented Mr. Skelton with an oak, chiming, grandmother clock, appropriately inscribed.

Mr. John Cypher, V.M.H.—The many friends of Mr. John Cypher, of Cheltenham, will deeply regret to learn he is suffering from a very severe illness that has confined him to his room for several weeks past. Many kindly expressions of affection and esteem for this fine grower and exhibitor were forthcoming from members of the R.H.S. Orchid Committee on Tuesday last,

Mandevilla suaveolens growing over a trellis as a hardy climber. With a view to test the severity of the winter, I inquired what species of *Passiflora* flourished under similar treatment and learnt that none but *P. caerulea* would live there out-of-doors; all others which had been tried had been killed by frost in winter. On my remarking that *P. caerulea* flourished in England, the gardener assured me that *Mandevilla* was decidedly more hardy; and that where *P. caerulea* flourished he had no doubt *Mandevilla* would equally. In accordance with this statement, I observe that a branch of *Mandevilla* which had grown out through the roof of my greenhouse, is this day (October 18) in perfect flower, having been exposed about ten days to a frost which injured French Beans, *Convolvulus major*, caused the leaves of Mangold Wurzel to droop, and so damaged flowers of *Passiflora caerulea* against a wall that they did not expand. I should remark that the greenhouse is span-roofed, so that the *Mandevilla*

FIG. 41.—GENTIANA FARRERI AT BLINKBONNY.
(see p. 325).

of virus diseases, for if anything could be done to get really outstanding immune varieties then their problems would be much easier. In the meantime they were endeavouring to produce Potatos which were an improvement on old standard varieties. The standard by which the Board of Agriculture tested the seedlings was a very high one, and when a new Potato reached the registration stage it had to be a really good variety. Mr. McGill stated, that in all his recollection he had never known a year when blight was so bad as in 1927, and he estimated the loss in Scotland at one-and-a-quarter million sterling. Mr. O'Brien said blight caused an annual loss to the country of £5,000,000, and in a year like the present it would be much greater. As blight could be controlled to a great extent, he thought they should concentrate their efforts upon it.

Presentations to Mr. and Mrs. Edward Skelton.—On the occasion of the retirement of Mr. Edward Skelton, chief of the

and at their request, Sir Jeremiah Colman agreed to send a letter of sympathy and good wishes to Mr. Cypher and his daughter.

Appointments for the Ensuing Week.

MONDAY, OCTOBER 24: Birmingham Gardeners' Mutual Improvement Association's lecture. WEDNESDAY, OCTOBER 26: Southampton Royal Horticultural Society's show (two days); French Chrysanthemum Society's Congress in Paris (three days); French National Horticultural Society's show; Sheffield Chrysanthemum Society's meeting; Wimbledon Gardeners' Society's meeting. THURSDAY, OCTOBER 27: Holland County Potato Show; London Gardens Guild Lecture. FRIDAY, OCTOBER 28: Imperial Fruit Show at Belle Vue Gardens, Manchester (nine days). SATURDAY, OCTOBER 29: Lancaster Horticultural Association's lecture.

"Gardeners' Chronicle" Seventy-five Years Ago.—*Mandevilla suaveolens*.—In a recent visit to the Botanic Gardens at Montpellier, I observed

was exposed both to wind and radiation without any protection whatever. I mention this to induce others to try *Mandevilla*, as I intend to do next year against a wall where *Passiflora* flourishes. I may add that the frosts at Montpellier are occasionally so severe that *Cupressus lusitanica* was severely injured, and Oranges and Olives killed outright. On the other hand, from the heat of the summer, *Nelumbium* both flowers and seeds in a tank in the middle of the garden.—*J. R., Gard. Chron., October 23, 1852.*

Publications Received.—*Schädlingsbekämpfung*, by Dr. Walther Trappmann; S. Hirzel, 2, Königstrasse, Leipzig; price, Rm. 20.—*Latin Names of Common Plants*, by F. Dawtrey Drewitt; H. F. and G. Witherby, 326, High Holborn, W.C.; price, 3/6 net.—*Alte Bürgerliche Gartenkunst*, by Hans Reichow; price, Mk 4; *Saaleck*, by Paul Schultze-Naumburg; price, Mk 4; both published by *Gartenschönheit*, Berlin-Westend, Akazien-Allee 14.

The Week's Work.

THE ORCHID HOUSES.

By J. T. BARKER, Dunstable, Bedfordshire.

Miltonias.—Miltonias of the Brazilian section, such as *M. Binotii*, *M. spectabilis*, and its variety *Moreliana*, with *M. Clowesii* and *M. Regnellii*, produce their flowers during late summer and early autumn. After the plants have flowered and the pseudo-bulbs have finished their development, the supply of water at the roots should be gradually reduced and the rooting material kept on the dry side until growth becomes active again in the new year. *M. candida* is now developing its flower spikes, and after it has flowered the plant should receive similar treatment. All these Orchids are subject to attacks of red spider, especially during the autumn, therefore, the leaves should be sponged occasionally with a weak solution of some safe insecticide.

M. Roezlii, **M. R. alba** and **M. Phalaenopsis**.—These are seldom found in good condition, although their progeny, *M. Bleuana* and *M. Venus*, are seen in robust health at the spring and early summer exhibitions. Their constitution is not so strong as in the case of the Brazilian section, and they should therefore receive careful attention. They also require a slightly higher temperature than that section, and as both the species named are now starting into growth and fresh roots are pushing from the base, any necessary repotting may be done at this season. Plants of *M. vexillaria*, which were potted some time since, and have become established in the new material, should now be removed to an intermediate temperature and placed in a light, airy position. During damp, dull weather, the immediate surroundings of the plants should not be kept too moist, as an excess of moisture may cause the foliage to decay. Water at the roots should be applied sparingly to Miltonias all through the winter months.

Paphinia.—Members of this small genus of low-growing plants are occasionally seen in cultivation. Both *P. cristata* and *P. rugosa* should be grown in small pans filled to one-half their depth with drainage material. They are best grown suspended from the roof of the warmest house and shaded from strong sunlight, especially during the summer months. A suitable rooting-medium consists of Sphagnum-moss and fibrous peat in equal parts, on which the plants should be placed, so that the base of the pseudo-bulbs may be on a level with the rim of the pan. As the Paphinias grow naturally in a very humid atmosphere, constant attention must be given to the supply of water, and also to keeping the plants free from insect pests, as these small plants fall an easy prey to attacks of any kind. When the new pseudo-bulbs are fully developed, water must be applied with great discretion.

Coelogyne cristata.—Plants of this species and its varieties have almost finished their season's growth, and when the pseudo-bulbs are fully matured only sufficient water need be given to keep the plants plump and healthy. Arrange them in a light position at the cool end of the Cattleya house. Where kept under cooler conditions, this *Coelogyne* continues to grow for another three or four weeks, and must be treated accordingly. Other *Coelogyne*s that have completed their growth should not be watered excessively or the roots will decay.

Cypripediums.—Many plants of the cool-growing *Cypripediums*, both species and hybrids, are sending up their flower scapes and should be given every encouragement to flower satisfactorily. The leaves should be cleaned thoroughly by carefully sponging them with a weak insecticide. As the scapes become of sufficient length they should be tied neatly to thin stakes to prevent them becoming twisted. When used as cut flowers, the stalks should be

as straight as possible in order that the blooms may be arranged to the best advantage. As the season advances, the plants should be afforded all the light possible and supplied liberally with water at the roots each time the compost shows signs of becoming dry. Large, pot-bound specimens of the different varieties of *C. insigne* may receive weak, liquid manure at alternate waterings until the flowers commence to expand; thence onward clear water only should be given. Plants of the summer-flowering section, such as *C. l'Ansonii*, *C. Shillanum* and *C. J. H. Veitch*, may be repotted as they pass out of bloom, should this be necessary.

THE KITCHEN GARDEN.

By R. H. CROCKFORD, Gardener to THE RT. HON. LORD WAVERTREE, Horsley Hall, Gresford, N. Wales.

Cauliflowers and Autumn Broccoli.—As frost is now likely to become more severe, much damage will be done to heads of these useful vegetables unless the curds are well protected by their own leaves. Where plenty of deep frames are available, it is wise to lift as many plants as possible with heads showing, and plant or heel them in, covering the lights on frosty nights. Another good plan is to lift all that are fully developed and hang the plants upside down in a cool, dark shed; under these conditions it is surprising to find how long the heads remain quite fresh. Before placing the plants in position, make quite sure that all caterpillars or grubs are removed, and while they are stored beware of rats and mice. I remember once storing plants in this way for exhibition and finding many heads spoiled by these marauders.

Celery.—A stock of Bracken or straw should be kept at hand ready to protect the tops of Celery. I find that Bean poles, placed in position so as to form a rough trellis over the rows, just clear of the leaves, will hold the Bracken covering admirably; this method allows the easy removal of the covering in fine weather, and is far better than laying the protective material directly on the plants.

Rhubarb.—Where a very early supply is appreciated, a few of the earliest and best matured clumps of Rhubarb may be lifted and left fully exposed to the weather for a little while before taking the crowns into the forcing house. A small amount of fermenting material should be placed in the bins, or on the floor, the roots laid thereon and well packed round with leaf-mould; maintain a humid atmosphere and useful stalks will soon appear.

Endive.—If plants of this indispensable salad are growing outside they must be protected from frost. Where they are fully developed, a quantity may be lifted with as much soil as possible attaching to the roots, placed in a frame, and kept quite dark to blanch perfectly; or they may be placed in a dark shed or Mushroom house. Fill all available frames with Endive plants in various stages of growth. The curled or mossy varieties damp off more readily than the round-leaved sorts.

Parsley.—Where grown outside in exposed positions, Parsley should also be protected during severe frosts. A few poles or battens arranged over the bed, on which mats or tiffany may be placed, answer the purpose well.

HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD, Wrotham Park, Barnet, Middlesex.

Borders for Peaches and Nectarines.—Where it is intended to plant Peaches and Nectarines against newly-erected walls the borders should be thoroughly prepared so that they may be ready when the trees arrive from the nursery. Both fruits require plenty of drainage, especially if the subsoil is of a heavy texture; indeed, it is a good plan to raise the border several inches above the surrounding level, unless the soil is light and porous, overlying gravel, and the climate is good for Peach growing. The borders need not exceed six feet in width,

at least for a few years, after which two or more feet of new soil may be added to its width if the roots have reached the previous limit. Good pasture loam, with plenty of old mortar rubble, wood ash and a fair sprinkling of crushed bones, all mixed well together, will suit these fruits; no manure need be added, except where the soil is of poor quality. At the bottom of the border place plenty of old broken bricks or other rough material for drainage, and cover this with turves placed grass-side downwards.

Good Varieties.—A few dependable varieties given in order of ripening are Waterloo, Duchess of Cornwall, Hale's Early, Rivers' Early York, Peregrine, Goshawk, Dymond, Royal George, Stirling Castle, Bellegarde, Barrington and Sea Eagle Peaches. If given a warm position, Princess of Wales will ripen its fruits very well in favourable seasons. Early Rivers, Cardinal, Dryden, Elruge, Pineapple, Humboldt and Albert Victor are all good Nectarines. There are other good varieties of each fruit but those named will usually give satisfaction and rarely fail to crop.

Sweet Cherries.—In all gardens where Sweet Cherries are given reasonable attention the trees generally give a good return for the labour bestowed upon them. When preparing the ground for the reception of the Cherries, see that the drainage is good and the soil durable. A west aspect is the best for these fruits, if grown on walls, and the trees should be trained fan-shape, although grand crops of large Cherries may be grown on cordons planted three feet apart. Varieties should be chosen to ripen in succession and thus maintain a supply for so long as possible. Early Rivers, May Duke, Waterloo, Bigarreau de Schreken, Black Heart, Frogmore Bigarreau, Kentish Bigarreau, Napoleon Bigarreau (one of the best), and Black Heart make a suitable selection.

Top-dressing.—This work is best carried out at the present time. Remove the old soil to a good depth, taking care to preserve the roots; after cutting the ends of damaged portions, relay the surface roots in good soil and follow with a mulch of manure, especially where the old soil has not been renewed for several years. Fruit trees will improve in condition rapidly when once the roots have taken to the new soil.

PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NALL-CAIN, Brocket Hall, Hertfordshire.

Chrysanthemums.—Many blooms of the large-flowered Chrysanthemums will be nearing maturity, and it is at this stage a little extra care is needed, especially when applying stimulants to the roots. As a rule, when the flowers are three parts open no more feeding is necessary, but discretion must be used in treating different varieties. The stronger-growing sorts will need more feeding to develop their flowers than those of a weaker growth that generally produce clean "kind" buds. Although many Chrysanthemum flowers are ruined by overfeeding after the plants are housed, others fail to develop because of insufficient feeding. To produce exhibition flowers of a high standard feeding is absolutely necessary. Although care is needed with regards to watering, it must also be borne in mind that the plants must never be allowed to suffer through lack of moisture at the roots, otherwise the florets of the flowers will flag and damping will follow. As the flowers develop less air will be needed; but, at the same time, a close atmosphere must be guarded against. Keep the top ventilators open day and night, more or less, according to outside conditions; during foggy weather the hot-water pipes should be sufficiently warmed to keep the air moving and dispel damp. Watering should be completed early in the forenoon so that the surroundings may become dry before evening. Earwigs should be sought for during the evening; they are easily caught by the aid of a strong light.

Late-flowering Chrysanthemums.—These should be grown under the coolest conditions possible to obtain flowers for use during the early months

of the new year. Guard against over-feeding or the growths will become sappy and fail to produce flowers of good substance. These late sorts will be found most serviceable where disbudding is resorted to, either partially or severely, according to the variety.

Campanula pyramidalis.—Plants of the Chimney Campanula raised from seeds as advised in a previous calendar, and which are intended to be grown for conservatory decoration, should be placed in their flowering pots, after which the pots may be plunged in ashes in a cold frame, where protection may be given during severe weather. Receptacles seven inches in diameter will be suitable for these Campanulas. Canterbury Bells are also useful plants for the conservatory and may be treated somewhat similarly.

General Remarks.—At this time of year when accommodation is sorely needed for winter-flowering and spring-flowering plants, it becomes necessary to discard plants that are of no particular value.

Early Bulbs.—Paper White Narcissi and Roman Hyacinths should be examined and if sufficient growth has been made they may have the covering material removed and be stood in a cool frame, where they should be shaded for a few days before finally exposing them to full light.

FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P., Ford Manor, Lingfield, Surrey.

Peaches.—By the time these notes appear all Peaches will be over and next year's crop will greatly depend upon the treatment the trees receive through the remainder of the autumn. It is a mistake to think that drought at the roots ripens the wood; indeed, when the time arrives for root-lifting, the careless grower will find that the trees have not received more than half the water they required. If the borders are properly made and drained, it is almost impossible to overwater old Peach trees after the fruit is gathered and all the ventilators are open. It is rather late to restore trees that have not had sufficient water, but where there is any doubt, no time should be lost in trying to set matters right. These remarks apply to early and late houses and to trees that suffer from bud-dropping in the spring.

Pruning.—Trees in early and mid-season houses will have been pruned, so far as cutting out superfluous shoots furnished with foliage can be done. Late trees should also be pruned without loss of time, allowing five or six inches between the growths. All the shoots retained and especially the leaders on extension-trained trees, should be left their full length. It is not necessary to cut close back, as the final pruning may be done when the trees are detached from the trellises, the object now being to let in light and air.

Borders.—Any borders in which the trees are making either too strong or very weak growth must be taken in hand and dealt with accordingly. If growth has been too strong, root-lifting and replanting in open, calcareous loam are the best remedies, and the firmer the compost is rammed the better. If growth is weak, owing to age or overcropping, the borders may be watered with diluted liquid manure, and top-dressed with good loam, soot, bone-meal and lime-rubble. Manure may be used in extreme cases, but generally the weakest trees can be restored by mulching, top-dressing and summer feeding. The new compost can hardly be used in too dry a condition, nor can it be made too firm. When the borders are finished, apply tepid water freely to encourage root action. If kept too dry the roots remain dormant through the winter, but if properly moistened, a careful examination will reveal new roots in the course of a few weeks.

Compost.—Advantage should be taken of fine, dry weather to lay in a good stock of old turf for use through the coming season, espe-

cially if it be of a heavy, tenacious nature. The preparation of soil often entails a great deal of wheeling, and the whole of the heavy work should be pushed forward when the soil is dry and warmer than it will be later. Opinions differ as to the proper depth of borders, but on well-drained sites two feet is ample if thorough watering is given when the fruits have set and are swelling freely.

THE FLOWER GARDEN.

By JOHN COUTTS, Assistant Curator, Royal Botanic Gardens, Kew.

Lobelia fulgens.—There are several fine varieties of *Lobelia fulgens*, and they often prove difficult to keep through the winter; in certain soils and situations the roots may be safely left in the ground, especially if they are covered with ashes. As a rule, however, it is wise to lift the roots and store them in cold frames for the winter; for this purpose pack them into boxes with some light, sandy soil. They may often be successfully wintered at the foot of a warm wall. *L. fulgens* and its varieties are generally confused with *L. cardinalis*, which is a very distinct plant with green leaves and by no means common in cultivation.

Montbretias.—Choice, named varieties should be lifted and placed in boxes, in which they should be stored in cold frames for the winter, increasing them by means of the stolons during the spring; by this means the finest results are obtained. The stolons should be detached and potted up separately or, if grown in quantity, they may be placed in other boxes of light, rich soil and planted in their flowering quarters at the beginning of May.

Schizostylis coccinea.—*S. coccinea* and its pink variety, known as Mrs. Hegarty, are both excellent for a display during September, October and November, especially when planted in a warm border in front of a wall. They are excellent for furnishing a supply of cut flowers and are easily protected from slight frosts. During the summer they enjoy plenty of water at the roots. The pink variety seeds freely and in my experience comes true from seeds. Planting or replanting is best done during the spring.

Reserve Garden.—Where a supply of cut flowers has to be maintained, plants suitable for the purpose should be grown in the reserve ground. Many bulbous plants are valuable for this purpose, including Narcissi, Tulips and Irises. The bulbs required for cut flowers should be planted in good time; the reserve garden may also be used for testing new varieties before they are planted on a large scale for bedding purposes.

Iris.—Both Spanish and English Irises are very useful, not only for bedding purposes, but also for furnishing a supply of cut flowers. As bedding plants, they have the disadvantage of flowering rather late, and for this reason they are best used in odd beds where they may be replaced by early Chrysanthemums, or some subject that may be grown on in pots. The newer Dutch Irises flower about ten days in advance of the Spanish varieties, and on this account they have a distinct advantage for bedding purposes. The Spanish varieties do not, as a rule, last long, except on very favoured soils; the English varieties are, however, long-lived, and increase when left in the ground. For this reason they are well suited to planting in clumps in the mixed or herbaceous border.

Sweet Peas.—Seeds are best sown from the middle to the end of October. Very early sowing is a mistake, as the resulting plants do not winter well. Many advantages accrue from autumn sowing, provided the situation and local conditions admit of successful wintering; unfortunately, in many localities it is almost impossible to bring seedlings safely through the winter, especially in damp, low situations, where slugs prove very troublesome. The best results are usually obtained in open positions on warm, well-drained soil. Where outdoor

conditions present difficulties it is a good plan to make a sowing towards the end of October or beginning of November in cold frames, keeping the seedlings perfectly cool during the winter and removing the frame lights on every favourable occasion.

FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF AILSA, Culzean Castle, Maybole, Ayrshire.

Bowling Greens.—Where any repairs are necessary the present month is a most suitable time to carry them out, and when completed the application of a suitable fertiliser, such as blood manure or finely-ground bone-meal is recommended. This should be evenly distributed over the surface of the green during dry weather, and brushed in, after which a coating of sea-sand should be spread over the manure and carefully levelled by using a wooden tool made for the purpose. When the greens are mossy, the moss should be removed by scarifying the surface with rakes, or by using the moss extractor sold for dealing expeditiously with this trouble, but in order to get rid of the moss permanently the greens should be pierced at regular intervals of a few inches apart, and deep enough to reach the sand on which the turf is laid, usually about three inches; this work is performed by using a tool resembling a short, blunt digging fork, and occupies a considerable time if done thoroughly. The results, however, are usually very satisfactory, as the turf is thoroughly aerated, and by the time the playing season comes round again the holes have filled up and the fresh young grass forms a perfect surface. The banks also require attention when subsidences have taken place, and they must be brought up to the regulation height above the greens, while the ditches around the green should also be trimmed and a fresh coating of gravel or other material placed therein.

Chrysanthemums.—The later varieties of Chrysanthemums should now be ready for placing under cover, but nothing is gained by removing them until the buds are well set, and, so long as frost keeps away, they are better left out-of-doors. They should, however, be so arranged that they may be readily protected at short notice when frost threatens. The earlier varieties which were housed some time ago must be well supplied with stimulants such as liquid manure, or light top-dressings of an approved artificial manure, until the blooms begin to show colour. Keep a close watch for green fly or other insect pests, and fumigate accordingly. Where the leaf-miner is troublesome good results have been obtained by fumigating with the preparation known as Auto-shreds, and, so far as observed, not the slightest damage is done by this fumigant to the tenderest foliage, while its penetrating fumes appear powerful enough to kill the leaf-miner embedded in the leaves. Cinerarias also may be safely fumigated by this preparation without danger of disfiguring the foliage.

Cyclamens.—The old corms which were repotted in July are now growing more freely; so soon as the roots have reached the sides of the pots they may be watered more frequently, and when well rooted should be given a little extra feeding occasionally. These older plants are sometimes attacked during the autumn months by a grub or maggot that works in the soil and is not readily observed until the foliage begins to flag; examination then shows that the roots and sometimes the base of the corm have been eaten. To prevent the attack from spreading, or to kill the grubs before too much damage has been done, water the plants two or three times with lime-water which has been prepared by placing a quantity of ground lime in water and allowing time for it to settle, using only the clear lime water. Young plants which are beginning to show flowers should have these removed, and if they also have well-filled their pots with roots, an occasional watering with soot-water and diluted liquid manure will assist them to grow vigorously and produce healthy foliage.

TREES AND SHRUBS.

LAVENDULA STOECHAS.

THOUGH a native of the hot, dry slopes of the hills bordering the Mediterranean, this Lavender has survived two or three winters here and is now blooming. It grows about two feet tall and the leaves, which are broader than those of the common Lavender, are rather more than an inch long and pale grey-green on both sides. In its native south where there is more sun, they are very much greyer. The flowering stems rise erect to a height of some six or twelve inches and terminate in a dense, four-sided, cone-shaped inflorescence. The true flowers are a very deep purple, almost black, but the sterile bracts which surmount them are a rich purple. But these bracts, which may be over an inch long and fully half as wide, vary a good deal in shade of colour in the wild plants, some of them being a pale mauve, others approaching a sumptuous violet, with intermediate tints. There is also a variety with pure white bracts, but this I have not seen. *L. Stoechas* is often extremely showy in its native haunts, and if it proves hardy enough for dry sunny spots in favoured parts of this country it should be a useful little shrub. It would be interesting to know how other readers have succeeded with it and to what extent it can resist frost.

BUDDLEIA ALTERNIFOLIA.

It would be interesting to hear the candid opinion of others upon this shrub, for while there are some who extol its qualities with unrestrained fervour, not a few hold their peace when they do not "damn by faint praise." I belong to the latter company and may have been unfortunate, but I have not yet seen *B. alternifolia* make anything like the effect one is led to expect. Again, I read the other day that *B. alternifolia* was the ideal shrub for the small garden, but my own experience of it leads me to believe that it will eventually grow larger than any of the better-known hardy species. One specimen here has made strong upright shoots nearly ten feet long in a single season, and it has flowered so feebly that I am contemplating removing it in favour of something better. Yet *B. alternifolia* is a shrub of such superlative elegance of habit that, given plenty of space and a generous crop of blossom, it should make a most inspiring object. *J.*

ESCALLONIAS.

THIS genus contains many handsome shrubs, of which all are more or less evergreen, with the exception of *E. philippiana*. They are more or less tender, except in the milder districts where they make beautiful specimens in the open; in the colder counties many thrive if given the protection of a wall. Two kinds that contribute to the floral display in the garden during September are worthy of special note.

Escallonia exoniensis is a rapid-growing plant with shining green leaves, and attains a height of ten to fifteen feet or more in favoured districts. The flowers are borne in terminal panicles, and vary from very pale rose to pure white, and are produced with the greatest freedom from June to September. This is a much harder shrub than most people imagine it to be, for it will withstand severe weather when many others are killed by frost.

Another fine *Escallonia* in bloom at the end of September is *E. montevidensis*, and without doubt this is one of the best of this genus. A native of South America, it is only in the milder and more favoured districts that we see it at its best in the open. I have recollections of specimens growing in a district more favoured than some parts of Surrey, and where the plants were the joy and pride of the proprietor and his gardener every autumn. We cannot all succeed with this shrub in the open, but it is well worthy of the protection of a wall, where, in an average season, it will winter safely. The Wisley plant is growing against a wall facing north, where it was an object of great beauty for several weeks, with its large, rounded trusses of white flowers and its bright green foliage.

E. macrantha, a common shrub in southern and western maritime districts, where it can be

used for forming hedges, is most attractive, as its rosy-crimson flowers are produced in endless profusion; the foliage is of a shining green and very ornamental. Even if the plant is cut down by frosts it will usually grow away again with great vigour from the ground level. I recently examined some examples growing in the open in an exposed part of a garden in north Norfolk; the plants were killed to the ground level during the winter of 1917, but are once again beautiful specimens. *E. langleyensis* is a hardy kind and will survive all but the severest winters; it has a graceful, pendulous habit, making a bush from five feet to seven feet high and covered during June and July with rich, rosy-red flowers, which are freely produced. *E. Donard* Seedling is becoming a well-known variety, although of recent introduction; the flowers are pale pinkish-mauve; it is a rapid grower and soon forms an attractive bush.

E. philippiana, the hardiest member of the genus, is more or less deciduous; it is quite a distinct shrub, bearing white, fragrant flowers in great profusion.

Of the Escallonias that are furnished with resin glands on the leaves and branches, mention may be made of *E. illinita*, an evergreen species, bearing white flowers. This is said to be hardy but was killed to the ground level during 1925-26 at Wisley. Known to many as the Pig Plant, this *Escallonia* has the peculiarity of emitting an odour which is suggestive of a pig-sty; so strongly odorous are the shoots and leaves that they will retain the odour for months after they have been dried. It seems, from observation, that the peculiar odour is most freely emitted during dull, damp days, especially during the latter part of summer and autumn. *R. F., Wisley.*

PLAGIANTHUS LYALLII.

KNOWN in New Zealand, of which country it is a native, as the Lacebark, this semi-deciduous plant grows naturally to a height of from twenty to thirty feet, though it seldom attains to more than ten feet in this country. Its young growths are covered with silvery down, but they become dark brown and furrowed with age. The leaves are usually semi-persistent, remaining in clusters at the ends of the growths. They are heart-shaped, bright green in colour and slightly downy, with deep, doubly-crenated margins, slightly tapering apices, and downy petioles an inch or more in length.

The flowers are produced in drooping axillary clusters on stalks about an inch long. The corolla consists of five concave, pure white petals, while the clusters of stamens are yellow-anthered, thus increasing the attractiveness of the blooms. *Plagianthus Lyallii* should be planted in a warm, sheltered position, or given the protection of a wall, in well-drained loamy soil. It may be increased from cuttings or layers. *A. G. F.*

THE HEATH GARDEN.

(Concluded from p. 311).

ERICA TETRALIX comes next; this is the common Cross-leaved Heath found in all parts of the country, and very often in very wet places, with large pink flowers. There are several varieties, including two or three white ones—the best being *E. T. alba mollis*, with silvery-grey foliage (this gained an A.M., R.H.S., just lately). There is *E. T. Mackayi*, and its double form, which is very pretty; both have deep pink flowers.

Erica vagans, the Cornish Heath, follows. This has several varieties, one of which, *E. v. Mrs. D. F. Maxwell*, is, in my humble opinion, the best of all. I congratulate the introducer, Mr. D. F. Maxwell, the Heath expert of the Broadstone Nurseries, on his find. I read its history in his delightful book on Heaths, *The Low Road*, but having lent this to a friend, I am unable to verify the facts, but I think he found it at Helston, in Cornwall, on a bank, whilst picking Mushrooms—having got wearied of looking for an outstanding variety. It is a plant that should be in every garden, and has flowers of a rich cerise colour. With all due deference to that well-known artist, Miss Wini-

fred Walker, I do not think she has done the plant justice, but it may be the printer's fault, for my recollection of the coloured illustration in the book referred to is that it is decidedly dull and drab looking, whereas the plant in real life is not.

The second best plant is *E. v. St. Keverne*, found by that great gardener and charming gentleman, Mr. P. D. Williams, of Lanarth. This plant has soft rose-pink flowers, without a suspicion of blue in the pink, and is a very charming Heath. Like the previous one, it should be in every collection, and plenty of it. Another new variety that came to me through the Broadstone firm is *E. v. Lyonesse*, and this is far and away the best of the white forms. There are also *E. v. carnea*, pink flowers; *E. v. grandiflora*, with pink flowers in a long spike and of loose habit; *E. v. pallida*, pale pink; *E. v. rubra*, deep red. These varieties carry the brown, dead, flower heads throughout the winter and are quite attractive then.

The last of the species is not an *Erica* but *Calluna vulgaris*. This is the Common Ling, and there are many varieties of it. For a long time I was under the impression that *E. cinerea* was the Scotch Heather, but I found that the Ling in England becomes Heather in Scotland. There are many white forms, only three or four being really distinct. The best are *C. v. alba Serlei*, which flowers latest of all the white forms; *C. v. a. Hamondii*, which grows rather upright and into big bushes with rich green foliage; *C. v. Alportii*, that has bright crimson flowers and is of rather upright habit, with a sort of purplish tone to the foliage; *C. v. fl. pl.* has double flowers of a mauve-pink shade. I find the habit somewhat straggly.

There are several other forms, but many are still rare and others are too much alike to trouble about, but the following are worth growing:—*C. v. aurea*, which has the ordinary purple flowers but the foliage is golden-yellow, becoming deeper in winter, and for this reason it is worth its place for winter colour; *C. v. cupraea* is, perhaps, better still, but on the shady side of the plant the winter colour is lacking; the general tone is, as the name denotes, copper colour.

Then come three dwarf forms, two, if not all, of which may be used for covering the paths in the Heath garden. The dwarfiest is *C. v. minima*, growing only about two inches high; *C. v. Foxii nana*, slightly bigger; and *C. v. pygmaea*, which grows up to about six inches. They are rather shy in flowering, hence their use for the paths, which can also be planted with *Thymus serpyllum*.

There are some hybrid Heaths but still scarcer, chiefly of *E. ciliaris* and *E. Tetralix* blood, which the Heather specialist may get to complete the collection, as well as *E. scoparia* and *E. stricta*, both tall growing. The former is grown as a foliage plant as its greenish-brown flowers are of no value. The latter has pink flowers which appear spasmodically during the summer, but both are more of botanical than garden interest.

Many dwarf shrubs that delight in the ideal Heath soil may be grown in the Heath garden, chief among them would be the dwarf Rhododendrons of the Lapponicum section, which in their native land, take the place of Heather on the mountains and moorlands. Most of these have flowers of blue, mauve or lavender shades, and bloom very freely; *Andromeda polifolia*, with its pink, drooping bells; some of the dwarf Azaleas, although I should prefer them to have slight shade for some part of the day in the hottest part of the year; *Gaultherias* in variety; *Ledums* and *Pernettyas*—in all the different coloured forms obtainable. *Daboecia polifolia*, the St. Daboec's Heath, should, I suppose, have been included in the list of the Heaths, but it is not an *Erica* or even a *Calluna*, so has been kept apart. There are white, purple and bicolor forms.

And now I think my list is exhausted, but what genus can give such a show over such an extended period and at such little cost after the initial expense?

If space allows, plant some double Gorse about the Heath garden, and, on the sheltered side, *Erica australis*. *Erica.*

GENTIANA FARRERI.

The photograph reproduced in Fig. 141, p. 321, shows *Gentiana Farreri* growing in my garden in Perthshire. The plants were raised from seeds sown in the spring of 1925. Some of the plants flowered last year, but during the present summer they have increased in growth very much, as shown by the photograph, which was taken early in September. These plants were raised from specially selected seeds taken from plants which have very large flowers, with the result that nearly all of the seedlings have given exceptionally large blooms.

When raising the species from seeds, I find a great variation in the colour of the flowers, from very light to dark blue.

Gentiana Farreri requires a much more

ALPINE GARDEN.

IBERIS SEMPERVIRENS VAR. GARREXIANA.

The evergreen Candytuft is a very popular garden plant and is useful alike in the rock garden and the flower border. There are several varieties in cultivation, and the one named *Garrexiana* is, perhaps, the best for general use because it does not spread so much as certain others. The heads of white flowers are not so large as in the case of some other Candytufts, but they are produced very freely in spring, and as the flowering season advances the flower stems elongate. *Iberis sempervirens* var. *Garrexiana* is fine in the mass (Fig. 142), and as propagation may be effected by means of seeds, layers and cuttings, there should be no difficulty in obtaining sufficient

withstanding our seasons. He wrote: "It is absolutely hardy in any decent soil or situation."

Notwithstanding this verdict and its own charm of appearance, *C. plantaginea* is rarely listed in catalogues now, and in private gardens, where it was wont to be found, it is no longer visible, having succumbed to some cause or other. The writer has had it several times but has not found it easy to retain, even though in favourable conditions, and this is no uncommon experience among his friends and other correspondents. This is not only to be regretted but it is a matter for surprise, as it is a native of cold, wet places in Patagonia and Terra del Fuego, and surely ought to thrive with us. With me it succumbed in winter or spring, and possibly its demise was hastened by, if not altogether due to, slugs, which are fond of its foliage and injure it badly. The leaves are large, glossy and very ornamental, with very

FIG. 142.—IBERIS SEMPERVIRENS VAR. GARREXIANA.

moist soil than that in which *G. sino-ornata* will grow. For the last four or five years I have been experimenting in growing *G. Farreri* in different parts of my garden, and find it succeeds and flowers best in full sun, but in soil that is always moist, even in a very dry summer. The plants illustrated are growing on the level, in a peaty soil which is full of stones that ensure good drainage. Some growers of this *Gentian* find that the foliage of their plants turns brown before the flowers open; but I think if they were to grow it in a moist, well-drained soil they would succeed much better. *G. Farreri* should always be raised from seeds as the seedlings have a far better constitution than plants raised from cuttings, and it is very interesting to see the variations in the way of colour and size of bloom.

Seeds sown in early spring will germinate very freely in about ten days, and if the seedlings are pricked out into boxes and finally planted out by the end of May, most of them will flower the following autumn. A. Harley, *Blinkbonny, Kirkcaldy*.

plants for a large group once a specimen is established. Cuttings and layers, however, provide the best means of keeping the plant true.

Some little confusion has arisen in regard to the varietal name, as *I. Garrexiana* (the evergreen form) is sometimes described as a species, or possibly a hybrid between *I. sempervirens* and *I. saxatilis*, although Kew considers it a form of *I. sempervirens*. There is also another *Garrexiana* (*I. Garrexiana*, Scop.), but this is referable to *I. saxatilis*.

CALCEOLARIA PLANTAGINEA.

SOME flowers which are of high beauty, appear destined to be forgotten unless they are offered in current catalogues, and of such *Calceolaria plantaginea* is one. It has received high praise from that keen critic of alpenes, the late Mr. Reginald Farrer, and has been appreciated by those of us who have grown it. From what Mr. Farrer states in his *English Rock Garden*, it ought to be quite capable of

pronounced corrugation, and in late summer the plant produces sprays of yellow flowers on a foot or more in height.

Where one has failed to retain this *Calceolaria* it would be foolish to advise regarding treatment, but I still do not despair of succeeding with this capital plant in some cool spot, comparatively free from the ravages of slugs. S. Arnott.

TWO ALPINE KNOTWEEDS.

Two dwarf *Polygonums* from the Himalayas rank high amongst alpine plants on account of their floral beauty; these are *P. affine* and *P. vacinifolium*. They are both distinct in habit and very free-blooming during September and October, and are therefore doubly desirable on account of their late blooming habit. Both are hardy if planted in suitable positions and flourish in ordinary loamy soil, while they are easily increased, the former species by division and the latter by cuttings, which, if rooted during the summer and wintered in a cold frame, will provide plants for planting into permanent quarters in the spring.

P. affine is of rapid growth and soon forms dense masses of practically evergreen, rich green, spatulate leaves that arise from a woody prostrate rootstock. Its flowers are bright rose in colour and are produced freely in dense terminal spikes about three inches in length, borne on slender, sparsely-leaved stems from six to eighteen inches high, the small, cauline leaves arising from the base of slender, brown, membranous sheaths. This Knotweed is useful for massing on rocky, sunny slopes.

P. vacciniifolium is of entirely different habit. It forms a close mat of long, woody, trailing growths which are closely covered with small, elliptic, rich-green, persistent leaves. From these trailing growths hosts of leafy flower stems arise, six inches or so in height, terminated by slender, compound spikes of small rose-pink flowers, slightly paler in colour than those of *P. affine*. This species is most effective if planted in a sunny but sheltered position, where it may drape or trail over rocks. *A. G. F.*

LINUM MONOGYNUM.

I HAVE grown this beautiful New Zealand Flax for a good many years and it has never been other than delightful and easy to manage. Though it is apt to die off in winter when growing in damp soil, it is a sound perennial on any really well-drained rock garden ledge. As old plants are liable to get worn-out, frequent division is desirable, but seeds are yielded in such quantity and these germinate so easily that a plentiful stock of young plants is always available from this source. *L. monogynum* makes a dense but elegant sheaf of slender, glaucous, green, leafy stems about fifteen inches in height. These terminate in clusters of large, snow-white flowers, and a succession is maintained almost throughout the season. This is a first-rate rock garden plant, and in a really dry soil it will withstand at least 15° to 20° of frost without serious injury.

HELIANTHEMUM LIBANOTIS.

THIS is such a charming and very distinctive Sun-rose that one is surprised that it is not more often seen in gardens. It is allied to *H. umbellatum* (often erroneously called *H. rosmarinifolium*), but the very pale green leaves are even narrower than they are in that delightful species, nor does the plant appear to grow quite so tall. With me, growing on the top of a dry, retaining wall in full sun, *H. Libanotis* makes a semi-trailing, loose-habited shrub of a foot, or rather more, in height. The flowers are fully twice as large as those of the allied species named, and of a lovely shade of clear yellow. They are produced singly, or in twos and threes, at the ends of the very slender branches from late May onward for several weeks. *H. Libanotis* is certainly one of the most delightful of all species of its race in its own colour and it appears to be quite as hardy as any of them. *A. T. J.* [See pp. 315, 316.—Eds.]

PHLOX SUBULATA.

AMONGST the dwarf, early-flowering Phloxes, *P. subulata* and its varieties provide a group of exceedingly useful plants suitable alike for the rock garden, wall garden, or as an edging to the border. Of free growth and creeping habit, they form thick, carpet-like, evergreen masses, sometimes so much as two feet through, which are pleasing at all seasons and during the flowering season, from April till June, the foliage is almost hidden by a multitude of bright blossoms, thus making a most attractive display.

The plants are not very exacting as regards soil, but thrive best in a well-drained loam, while soils of a very retentive nature may be made suitable by the addition of sand and leaf-soil or similar material. They also succeed in almost any position, provided they are free from the influence of overhanging trees. Large clumps are liable to suffer from damp during the winter, and care should be taken that leaves do not collect in them. It is an easy matter to maintain a young and healthy stock, however, for cuttings root very freely if they are inserted in sandy soil soon after the flowering period and given the protection of a cold frame for

a short time. They should be exposed so soon as roots have formed, when they soon make strong plants, which may be transferred to their permanent positions during the following planting season.

The flowers of *P. subulata* are rose-coloured with a dark eye, while of the numerous varieties, which cover a fairly wide range of colour, the following are worthy of mention: *G. F. Wilson* is a beautiful, free-growing plant with attractive mauve-coloured flowers; *Leila* has pale, rose-grey flowers with purple eye; *Lilacina* is a free-flowering variety with greyish-blue flowers; *Moerheimii* is a compact-growing plant with bright, pink flowers; *Nelsonii* has cushions of moss-like foliage spangled with white flowers, with a tiny, pink eye; *Sprite* has rose-coloured flowers with a crimson eye; and *Vivid*, which is probably the most attractive variety of all, and has warm, salmon-rose flowers of great beauty. *P.*

FLOWER GARDEN.

GAZANIA SPLENDENS.

HAVING seen this *Gazania* in some of the public gardens in the Isle of Thanet, I was impressed by its value. The soil and climatic conditions evidently suit it. I saw it in quantity in various positions, and always healthy and flowering profusely. It was used as a carpet plant between *Tamarix* on the coast, and on the rock gardens it was a conspicuous subject. Beds of *Antirrhinum* in the Winterstoke Gardens were edged with wide belts of *Gazania splendens*, and in another instance it was planted around the lamp standards near the approach to a public hall. In every case the effect was pleasing, and visitors had an opportunity of estimating the value of this somewhat neglected plant.

Gazania splendens was formerly grown in many gardens as an edging plant and for furnishing the fronts of window boxes. Although a sun-loving plant, it has flowered profusely during the present season, and the large, Marigold-like flowers, produced in masses, have been conspicuous during a summer when brightly-coloured subjects have in many cases suffered from an excess of moisture. There is a variegated form also worthy of cultivation. *Gazanias* may be increased from cuttings inserted in sandy soil during the autumn. *C. Ruse.*

BULB GARDEN.

ALSTRÖMERIAS.

THE *Alströmerias* comprise a small genus of tuberous-rooted plants of distinct beauty and considerable decorative value, both as border plants and for cut flower purposes. As most kinds are natives of South America some doubt exists as to their absolute hardiness, but on well-drained soils they may be considered quite hardy.

The essentials for successful cultivation are a deep, well-worked soil and an open sunny position. A not infrequent cause of failure is shallow planting, hence the advantage of a deep, well-worked soil where the tubers may be covered to a depth of six inches or eight inches and there is no danger of water-logging. *Alströmerias* resent disturbance, and generally do not attain their full beauty until the second or third year after planting. They should therefore be left undisturbed for several years or until they show signs of deterioration through overcrowding, when they may be lifted and divided. Lifting affords an opportunity for increase of stock, but plants may also be raised easily from seeds.

A. aurantiaca is the most widely grown species; it has rich orange-coloured flowers, spotted with red, and is probably the best of the genus. *A. chilense* varies in colour from orange to deep red. *A. lutea* has yellow flowers. *A. P. C.*

THE LARGER-FLOWERED TULIP SPECIES.

THE larger and more showy Tulip species possess a very real garden value which may be turned to good account if only they were more easily obtainable in quantity. I well remember reading an eulogy by that lover of bulbous plants, the late Rev. Joseph Jacob, upon a long border of *T. praestans* which he had seen in full flower in the Zwanenburg Nursery, Holland. Even to imagine such a feast of colour is wholly pleasant, and to actually visualise such a display must be to witness something incomparably sensational in its intensity.

However, such species as may be obtained at reasonable rates are well displayed on a rock garden or in a border devoted to choice bulbs, where little colonies will render an excellent account of themselves.

Tulipa Kaufmanniana is, of course, easily procurable, and is a choice and well-known species; it is a variable flower, usually with a ground colour of palest primrose, sometimes with flames of carmine on the exterior of the perianth and the same colour round the yellow base; this same base is gloriously displayed by the open "Water-Lily-like" flower—a sunset suffusion of orange and yellow. *T. K. aurea* is deep yellow, and *T. K. coccinea* is bright scarlet with a yellow base. There are several other more or less distinct and wholly desirable varietal forms of this fine Tulip. *T. Kaufmanniana* came from Central Asia in 1877, and is figured in *Bot. Mag.*, t. 6,887. It is early-flowering.

T. Greigii is a gorgeous Tulip, introduced from Turkestan in 1873, and has never been very plentiful; a distinctive feature of this species is the chocolate markings displayed by the broadly-oblong, glaucous leaves. The perianth is coloured an intense flame-red and possesses a dark base bordered with yellow; the stigma is large, the anthers bright yellow, and the peduncle pubescent. This magnificent species flowers in April.

T. Fosteriana, introduced from Bokhara, is intense vermilion, a wonderfully coloured and noble flower; there is variation in the basal colouring, some flowers having dark bases and others pure yellow.

T. Eichleri bears some similarity to the foregoing species; the colouring of the large flower is bright crimson-scarlet with a black blotch spread over the whole claw of the perianth segments and bordered with yellow; it flowers, with *T. Fosteriana*, in April and May, and somewhat resembles *T. Gesneriana*, the chief point of difference being the pubescent peduncle, not present in *Gesner's* great Tulip. *T. Eichleri* was introduced from Georgia so long ago as 1874, and is figured in *Bot. Mag.*, t. 6191.

T. praestans was introduced from Bokhara in 1902, and is a singularly striking species with very light, bright green foliage and brilliant vermilion flowers, several on a stem; it flowers in April.

T. Oculus-solis is very near to and possibly synonymous with *T. praecox*, and is a very fine, bold-growing Tulip from the South of France, and Italy, whence it came in 1825; the segments are bright red, with a black blotch that is bordered with yellow; the flower is supported by a stout stem. It is a very desirable plant.

T. Mauritiana is an attractive species with a bright red flower and a yellow base; the flowers are unusually persistent and the species is a "good doer." It is probably a variety of *T. Didieri*.

T. Gesneriana is a variable species. The type has a large perianth, campanulate, the segments sometimes bright red with a very obscure basal blotch. The quaint and variable Parrot Tulips are referred to *T. G. dracontia*. The form sold as *T. G. major* is a magnificent garden Tulip. *T. fulgens* is a scarlet species with a yellow base and yellow stamens.

T. Kolpakowskiana is also a variable plant, the colour of the segments ranging from bright scarlet in some forms to bright yellow in others, with a basal blotch of black and yellow. A pretty variety, has deep golden-yellow flowers, shaded externally with rose. *T. Kolpakowskiana* flowers in April, and is a very fine and very old large-flowered species; it was introduced from Central Asia so long ago as 1577 and is figured in *Bot. Mag.*, t. 6,710.

T. Hagin has dark, brick-red flowers, occasionally tinged with yellow, on stems fourteen inches to sixteen inches long; the flowers possess black and yellow basal blotches.

T. Sprengeri is one of the latest of Tulips to bloom; the flowers are fiery orange-scarlet shaded externally with yellow and embellished with golden anthers. We owe much to the Russian botanist, Regel, who introduced several Tulips from Central Asia, some fifty years ago, including T. Greigi and T. Kaufmanniana, and to Mr. C. G. Van Tubergen, junr., who organised expeditions and was responsible for such fine gems as T. Fosteriana and T. praestans. The late Mr. H. J. Elwes did much good work in this direction, introducing some superb species and growing in his garden at Colesborne Park a representative collection of these interesting and lovely bulbs. The late Mr. Dykes was also a great authority on Tulips.

I have not referred to the score or more of smaller and very pretty Tulips, but have confined my remarks to those larger-flowered species which should become popular and magnificent garden plants, so soon as they are available in quantity. *Ralph E. Arnold.*

NOTES FROM GLASNEVIN.

IMPATIENS JERDONIAE.

THIS remarkable and ornamental Balsam (Fig. 143) is by no means new to cultivation, having been introduced to Kew so long ago as 1852 (*Bot. Mag.*, 4739). Not only are the short, fleshy stems, of a conspicuous, reddish-brown colour, but the flowers are remarkable, consisting almost entirely of a single, inflated, pouch-like petal, salmon-red in colour; contrast is provided by the sepals, which are green and yellow. The ovate, serrated leaves are assembled towards the upper end of the stems where also the flowers appear. The flowering period continues throughout the summer, and even a small group of plants remains attractive for several months. The plants succeed admirably in small pans, in a porous compost. During the summer months they flourish in a bright position, and a dry, airy atmosphere that is suitable for Succulent plants, but in winter they prefer a slightly higher temperature.

ANAPHALIS NUBIGENA.

This Himalayan Composite is valuable in the rock garden for its late flowering season, and for the silvery-white effect of the whole plant. The slender stems are eight inches to one foot high, furnished with white hairs throughout and bearing scattered, narrow leaves. The stems are terminated by heads of white flowers so that the whole plant is conspicuously silvery in appearance. A fairly elevated and quite unshaded position, and well-drained soil suit it well. According to the *Flora of British India*, this is a variable plant in size of leaves and number of "heads."

POTENTILLA FRUTICOSA VAR. FARRERI.

The polymorphic *Potentilla fruticosa* has produced no more delightful form than that bearing the name of the enthusiastic collector. From early summer until frost comes, it bears abundantly its bright yellow flowers, finely set off against the numerous small, much-divided, dark green leaves. Of twiggy growth, it makes a neat but vigorous bush, and is equally valuable as a rock garden shrub or for grouping in the shrubbery. It is at its best when fully exposed to the light and, together with other shrubby *Potentilla* species, varieties and hybrids, is admirably adapted for beds or for filling a sunny border. It is readily propagated by seeds or cuttings.

AMICIA ZYGOMERIS.

This distinct and handsome Leguminous plant is a native of Mexico and was discovered by the travellers Humboldt, Bonpland and

Kunth, while travelling in South America, and named by them in honour of John Baptiste Amici. De Candolle described it in his *Prodomus*, and it was subsequently described and excellently figured by Sir William Hooker in the *Bot. Mag.*, of 1843, t. 4,008. Although probably a shrub or sub-shrub in its native country, it is here a herbaceous plant producing, annually, stems which attain a height of five feet, bearing leaves composed of two pairs of large leaflets. When young, the leaves are subtended by conspicuous foliaceous stipules which soon fall off. The flowers, produced on short stalks from the leaf axils, are golden-yellow, the standard large and striking. The young leaves and stems are hairy, and in addition the whole plant is glandular. A remarkable feature of the plant is the sleep movement of the leaves. This is, of course, common in Leguminosae, but the fairly large dimensions of the whole plant in *Amicia* render the day and night positions of the leaflets conspicuous. Normally, spread out horizontally during the day, at night the leaflets hang limply downwards. In cultivation, *Amicia zygomeris* prefers a sunny position in well-drained soil, preferably at the

INDOOR PLANTS.

ZAUSCHNERIA CALIFORNICA MEXICANA.

As a pot plant the brilliant Californian *Fuchsia* makes a most gorgeous display with its dazzling scarlet flowers. Large groups of it, such as have been grown here in pots for the last two years, provide one of the most fascinating effects imaginable, as it flowers profusely for upwards of three months. I recommend it to all who have not grown it in this way, for not only is it valuable for the cold house, but it is a delightful and lasting subject for the decoration of dwelling rooms. Plants grown in six-inch pots with a few small twigs placed near the sides of the receptacles, will easily cover a space well over eighteen inches; forty-eight-sized pots may be used with excellent results.

Soon after the plants have died down they are pulled to pieces, the roots slightly trimmed, and about three small portions are potted directly into the receptacles in which they will flower. Very little water will be needed until

FIG. 143.—IMPATIENS JERDONIAE.

base of a wall, and in districts subject to severe frosts would probably require root protection in winter. I have not seen seeds produced, but cuttings of the shoots root in sandy soil with slight bottom heat.

ANTHOLYZA CAFFRA.

This handsome species of a genus more commonly represented in gardens by *A. aethiopica* and *A. paniculata* seems worthy of more extended cultivation. Seeds were sent to Glasnevin by a Dublin lady resident in South Africa, who has been instrumental in adding many interesting Monocotyledons to our collections, as well as various Proteaceae and Heaths. *A. Caffra* is figured in Sweet's *Flower Garden*, Series 2, t. 84, under the name of *Anisanthus splendens*. The bright red flowers are more conspicuous than those of the better-known species. The leaves are broadly linear and strongly ribbed, characteristic of the genus. So far, it has been cultivated in a pot in a cool house from the seedling stage onwards, but next summer we hope to try it out in a sunny border where similar plants are grown. *J. W. Besant.*

a fair amount of growth has been made. The compost we use consists of two parts good fibrous loam, one part each of leaf-mould, and manure from an old Mushroom bed or hot-bed, and plenty of gritty material to keep the whole porous. The pots should be well crocked so as to allow free drainage, and we place lumps of semi-decayed cow manure over the crocks.

From the time the soil is well-filled with roots, plenty of water and occasional supplies of liquid manure are given. The plants delight in full sunlight.

This treatment (with the exception of growing it in sunshine) is very different from that generally provided, as the *Zauschneria* is usually grown outside on a dry wall or in a dry position in the rockery garden. In the north, however, especially during such a wet season as the present, outdoor cultivation results in disappointment, but when grown as advised, in an airy house, without artificial heat at any time, it is a success.

I may add that all who have seen these pot plants at their best have been agreeably surprised at their beauty and usefulness. *R. H. Crockford, Horsley Hall Gardens, Gresford, North Wales.*

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the **PUBLISHER, 5, Tavistock Street, Covent Garden, W.C. 2.**

Illustrations.—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Editors and Publisher.—Our correspondents would oblige by delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers.

Urgent Communications.—If sent by telegraph, these should be addressed "Gard. Chron., Rand; or by telephone, to Gerrard, 1543.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Letters for Publication as well as specimens of plants for naming, should be addressed to the **EDITORS, 5, Tavistock Street, Covent Garden, London.** Communications should be written on one side ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

HYBRID LILIES.

FOR all that Lilies seem to exercise a perennial fascination over hybridisers of plants, it cannot fairly be said that their efforts in the creation of new forms of the genus have met with more than transient success. Brilliant hybrid Lilies have been reproduced in the past but they have had a meteoric career, and considering those at present available, in which human beings are known to have had a share, we are driven to the conclusion that not one is an improvement on its parents in any particular. And it is not for want of endeavour, for while there are published records of scores of hybrid Lilies, there must be unpublished records of many more.

It almost seems as if Nature had decreed that this genus of comparatively modest numbers and of exceptional beauty and elegance should not be modified by human agency, and the brief careers of some famous hybrid Lilies lend point to that view.

An incalculable amount of casual hybridising of Lilies has been done by amateurs and nurserymen in the past, and probably a year seldom passes in which some interested individual does not try his hand at it; but as a rule the work is done in haphazard fashion and not on definite or scientific lines. Lilies which are in bloom simultaneously are mated indiscriminately, as often as not in a perfunctory way, on the principle, apparently, of "chuck and chance it," and without regard to the section to which each belongs. The writer has known by no means extreme instances where *L. regale*, for example, has been mated with *L. Hansoni*, and the Formosan form of *L. philippinense* with *L. Henryi*! The offspring of a retriever and a bull dog would doubtless be an elegant specimen compared with the result of such unions as these; and yet, the hybridiser will argue that "you can never tell."

If men must hybridise Lilies, they might focus their efforts on some definite purpose, such as the improvement of stamina, a point in which exotic Lilies are all too weak when transplanted to our country. It would be a service rendered to horticulture if, for instance, something of the virile constitution of *L. Henryi*—a Martagon—could be infused into that frail but lovely species, *L. Leichtlinii*, also a Martagon,

and the despair of the English gardener. Again, what an achievement it would be if the lovely colour of the difficult *L. japonicum* could somehow be brought into the trumpet of that strong growing plant, *L. longiflorum formosanum*.

The evolution of a good yellow-flowered Lily combining the elegant habit and delicious fragrance of *L. Parryi* with the happy adaptability of *L. pardalinum*, would be a worthy object to work for, and it should not be unattainable because it happens that each of the species named is readily susceptible to the pollen of the other.

Whatever the future may have in store, it is significant that in this country the famous amateurs of Lilies of the past have been content, in the main, to take this singularly attractive genus as it is, seeking to select especially good forms and to master the elements of the cultivation of exotic species in our changing climate, rather than to raise hybrid forms. It is not to be

living being who has first-hand knowledge of Burbank's work on Lilies, a year later had upwards of 400,000 cross-bred seedlings in pans. These were planted out in a field and flowered in 1894. Three-fourths of them were eliminated and the remaining hundred thousand covered three acres, "solid in nursery rows."

"The field of three acres (at Sebastopol) slopes gently to the east; the soil is a light sandy loam; in an air line the distance to the Pacific Ocean is about twelve miles, and the air is tempered by daily ocean breezes. . . . In the field about one hundred thousand of the hybrids were in bloom It is needless to say that a richer mass of yellow, scarlet and gold could not well be imagined. Nearly all, unlike *L. pardalinum*, were fragrant many exquisitely so. With a favourable wind, the odour can be perceived at a distance of five miles. In colour the flowers

FIG. 144.—LILIUM TESTACEUM.

supposed that all of them have persistently resisted the temptation to hybridise this species and that, for we know that this is not so, but rather that they have realised that the game is not worth the candle.

In the systematic hybridisation of Lilies on a large scale, the work of Luther Burbank stands out above that of all others. About forty years ago, Burbank began by cultivating some fine wild forms of *L. pardalinum* he had collected in north-western California and transferred to his land at Sebastopol, north of San Francisco. Successive generations of seedlings of these forms were raised and intercrossed, and by 1890 Burbank had fixed five or six especially good strains. Then he began fertilising these *pardalinum* strains on a great scale with pollen of Lilies from other countries, and according to C. Purdy,* probably the only

range from the usual yellow or orange centre and scarlet tip of *L. pardalinum* to dark red on one hand and rich orange-red, lemon and a few white and pale lemon or straw-coloured flowers on the other. Nearly all are spotted or dotted, many faintly, and some are clear lemon-yellow. . . . The hybrids have inherited the strong constitution of *L. pardalinum* and its freedom from disease I also noted that hybrids of *L. Parryi* and *L. Humboldtii* show a vigour neither parent possesses."

"All are extremely floriferous, thirty to forty flowers to a plant being common, and a few having over a hundred. One of the most curious forms was one in which *L. pardalinum* var. minor had been crossed with an unknown species. This might be called a Tree Lily. The bulb threw up many stalks. One of these branched about a foot from the ground into eight branches. The largest branch had forty-three

* *Garden and Forest*, August 14, 1895, p. 328.

blooms, while the bulb bore two-hundred-and-seven.

When Purdy saw them in bloom he thought he could detect traces of the influence of the Lilies of the old world and eastern America, which had been used by Burbank in his experiments, but eventually Purdy reached the conclusion that all the crosses in which foreign Lilies had been employed were either failures or reversions to the pardalinum type.

On the other hand, the hybrids among the Pacific Coast Lilies were strikingly successful and Burbank achieved remarkable results by crossing *L. pardalinum* with *L. washingtonianum*, *L. Humboldtii*, *L. Parryi* and *L. maritimum*. Early in the century selected forms of these were distributed by Purdy, to whose care Burbank had consigned them in 1900, and many reached this country along with fine, cultivated forms of *L. pardalinum*. Some of the hybrids of *L. Humboldtii* were particularly lovely, and at one time it almost seemed as if Burbank had succeeded in imbuing the tissues of *L. Humboldtii* with the robust constitution of *L. pardalinum*.

But gradually these hybrid Lilies deteriorated in cultivation here, and for any permanent effect it has had on Lilies in general in this country, Burbank's work might never have been done. Few, if any, of the hybrids remain in cultivation in Britain now, though it is understood that Mr. van Tubergen, of Haarlem, still cultivates *L. Burbanki*, which was the name applied by a firm of nurserymen in New York State, without Burbank's sanction, to some of his hybrids between *L. pardalinum* and *L. washingtonianum*,* which they had acquired.

It was, perhaps, inevitable, that when Japanese Lilies first became available in Britain and America they should have been pressed into service by hybridisers, and if only indifferent success attended their efforts here, it was otherwise in the United States, where a brilliant series of hybrids was raised between *L. auratum*, *L. speciosum* and *L. tigrinum*.

The most remarkable of these was *L. Parkmannii*, which, with the exception of *L. testaceum*, (Fig. 144) was the only hybrid Lily thought worthy of inclusion in the *Monograph* of Elwes. It was the offspring of a union between a deep-coloured form of *L. speciosum*, as the mother, and *L. auratum*, and out of about fifty seedlings which Francis Parkman, the historian, planted out in his garden at Boston, Massachusetts, in 1869, only one had any hybrid character in it; that was the plant to which Parkman's name was ultimately attached. Virtually, it was a deep, red-flowered *L. auratum*, with flowers of a maximum span of all but one foot. Parkman sent some bulbs to Anthony Waterer, in whose nursery, at Knap Hill, the Lily flowered in 1875,† before going the way of so many hybrid Lilies.

Using the same Lilies as parents, C. M. Hovey, of Boston, also raised some remarkable hybrids, one of them having blooms fourteen inches across—larger even than *L. Parkmannii*. In 1864, he succeeded, too, in effecting what was described as an attractive cross between *L. speciosum album* and *L. tigrinum*.‡ In 1914, P. S. Hayward, of Clacton-on-Sea, raised a hybrid of much the same general character as *L. Parkmannii*, between *L. speciosum magnificum* and *L. auratum* var. *platyphyllum*, the latter being the mother (Fig. 145). This magnificent hybrid, whereof the stock came into the hands of the late Col. Hugh Warrender and the writer, has as poor a constitution as the rest, and is not easily kept going.

Innumerable hybrids have been raised between *L. Martagon* and others, and these seem to have a more tenacious hold on life than most. *L. Dalhansonii*, for instance, which was raised in 1893, is still in cultivation, as is *L. Marhan*, raised seven years previously. The Lily called *Golden Gleam*, which was raised in Huftelen's nursery at Le Roy, New York, in 1893, still pursues a more or less fortuitous existence in Britain. It was the result of crossing *L. Martagon album* with *L. tenuifolium*, and is a typical hybrid.

Before her death, six years ago, Mrs. Backhouse raised a number of interesting Lilies of a certain type by crossing *L. Martagon album* and *dalmaticum* with *L. Hansonii* (Fig. 146), and recrossing selected seedlings. In 1900, a Lily with flowers like those of *L. auratum*, but buff-colour, was raised at Kew between *L. Henryi* and the so-called *L. Brownii* var. *chloraster*. This Lily was named *L. kewense*, and though the writer managed to keep it alive for about twenty years; it always had a precarious hold on life and finally the last of the race disappeared two years ago.

L. regale had not been long in cultivation before it was laid under tribute by hybridisers, but so far it does not seem to have fathered any remarkable Lilies. The Lily known as *L. sulphurgale* has *L. regale* for one parent and *L. sulphureum* for the other, and is valued by some growers for its late-flowering habit. *L. princeps** is a natural hybrid between *L. regale* and *L. Sargentiae*, and the same parents,

forms. The Japanese do not hybridise Lilies, and the many Japanese varieties of *L. auratum* and *L. speciosum* have had a natural origin.

Mr. E. A. Bowles, in whose garden Farrer's Lily No. 316 (now called *centifolium*) flowered for the first time, has successfully crossed it with *L. sulphureum*, and the three-year-old seedlings promise well.

L. candidum has long been the sport of Lily hybridisers, but nothing very remarkable ever seems to come of their efforts. There is often a trace of hybrid character in the progeny, usually in some trifling alteration of leaf, petal or port, but the variations from type rarely amount to much; and though it can hardly fail to be born anew some day, *L. testaceum redivivus* has still to appear.* It should be easy of reproduction because though the garden form of *L. candidum* rarely sets fertile seeds, the wild form from Salonika, now in the hands of many growers, is lavish of it.

Though no one can have any serious doubts

FIG. 145.—LILIUM PARKMANNII, HAYWARD'S VARIETY.

as well as those of *L. sulphurgale*, have been mated time and again by amateurs, without, however, evolving a Lily superior in any way to the parents.

Dutch nurserymen have long had a *flair* for raising hybrids of the upright-flowered Lilies loosely classed in catalogues as *davuricum*, *elegans*, *Thunbergianum* and *umbellatum*. The type of the latter is probably a hybrid between *L. davuricum* and *L. croceum*, and it has undoubtedly been used by the Dutch as one parent of some of the hybrids referred to; but the parentage of most of them is so involved as to defy investigation. We may be confident, however, that the group of Lilies classed by Japanese bulb merchants as *L. elegans* has played a prominent part in the evolution of the Dutch hybrids. The Japanese forms of *L. elegans*, or *L. davuricum*, as it would be more correct to call them, are not hybrids but natural

as to the parentage of so obvious a hybrid Lily as *L. testaceum*, the facts of its birth are unknown. Shortly, the plant was first noticed in Haage's nursery at Erfurt, in Saxony, in 1836, among a bed of *Martagon* Lilies Haage had received from Holland. Simultaneously, three amateur gardeners of Lille had the plant, also from Holland, and soon afterwards Van Houtte, of Ghent, bought a number of bulbs in Holland. Bulbs soon reached England and Dr. Lindley, who saw the Lily in bloom at Rollisson's nursery at Tooting, in 1842, was the first to give it a formal name—*L. testaceum*.† Lindley thought it was a Japanese plant and his view was shared by Wallace of Colchester and others at the time, and for years afterwards. It is perhaps needless to add that no Lily even

* *Garden*, September 28, 1901, p. 220.

† *Gard. Chron.*, October 16, 1875, p. 494, fig. 106.

* *Gard. Chron.*, May 22, 1920, p. 255, fig. 118.

* In *The Garden*, January 28, 1889, p. 56, F. W. Burbidge reported that Col. Trevor Clarke had successfully reproduced *L. testaceum*.

† *Bot. Reg.*, 1842, *Misc.* 51, 1843, t. 11.

remotely approaching *L. testaceum* is known in Japan.

When *L. testaceum* is fertilised with the pollen of *L. chalcedonicum*—one of its reputed parents—the result is the Lily known as *L. Beerensi*,* a hybrid which had a precarious existence and has been reproduced since it was first published. Mr. L. Johnston, of Hidcote Manor, flowered the same hybrid in the course of last summer. When mated, Parry's Lily and *L. pardalinum* are profuse in the production of true hybrids, and some of these are very fine. Among the seedlings it is nothing exceptional to find a yellow-flowered *pardalinum*, which can hardly be far removed from the long lost *L. Wareii*. Unfortunately, however, no one seems to have discovered the secret of ensuring to these hybrids the priceless virtue of longevity, and so the stock gradually thins out.

It is not, perhaps, so generally known as it might be that no hybrid Lily seems definitely fixed, not even *L. testaceum*—by far the oldest hybrid known. None of those which have come into the writer's hands can be trusted to breed true from seed, and all must be raised by offsets, scale bulbs or stem cuttings.

Spontaneous hybrids among Lilies are rare, at any rate, in Britain, and in twenty-seven years' experience, the writer has only known of one, though he has had hundreds of many kinds flowering together in a small area, and has often watched bees flying from this species to that. *A. Grove*.

HOW A PATENT IS OBTAINED.

EVERY week applications are made to the Patent Office for the protection of various devices and gadgets which will be used by gardeners all over the country, and which in many cases have been invented by practical gardeners. These inventions include (I am quoting from the *Official Journal of Patents*) such articles as: A Potato dressing apparatus; packing cases for Potatoes; machines for removing stones, cores and stalks from fruit; machines for planting vegetables; collapsible barrels, and a hundred and one other similar devices. Yet for every application for patent rights there must be many gadgets or devices which have been invented by practical gardeners and used successfully by them and their friends, for which no patent has been obtained, and this in spite of the fact that the obtaining of this would have greatly benefited the owner. Why is it that so many people never trouble to protect their inventions, for inventions they are, by securing a patent?

There seems to be a general idea that the obtaining of a patent is an expensive and extremely complicated business; it certainly does cost a few pounds, and I would never advise anyone to obtain a patent for an invention which is merely weird and wonderful, but if a useful device is conceived, and it is such that it can be reproduced on a commercial basis, there is no reason why the inventor should not find it a source of additional income.

In the first place the object for which it is desired to obtain protection must be eligible. To be eligible it must be (1) an invention which is *new within the realm*; (2) the invention must be a *manner of manufacture*; thus where no material produce of a substantial character is realised or affected by the invention, no patent rights may be obtained; for instance, the rights of an author in the production of a book may be protected by copyright, but not by a patent, as this is not a manner of manufacture, and (3) the invention must not be contrary to law or morality, so that no patent may be granted for a lottery.

As regards the actual obtaining of the patent rights, this is governed by the provisions of the Patent and Designs Acts of 1907 and 1919, and the Patent Rules of 1920, which may be referred to for further details, and which may

be obtained from H.M. Stationery Office, Kingsway, London, W.C.2.

Anyone may apply for a patent, provided he is the true and first inventor, or provided he applies jointly with the true and first inventor. How should this application be made? The first thing to do is to obtain from the Controller of the Patent Office, 25, Southampton Buildings, London, W.C.2, a form of application. In this application the inventor will have to make a declaration that he is in possession of an invention, and that he claims to be the true and first inventor, and that he wishes to obtain a patent for his invention.

When this application is sent in it must be accompanied either by a complete or a provisional specification. If it is decided to have a complete specification, this will have to describe the invention in detail, explaining how it is constructed and how it is worked, whereas if a provisional specification is used, all that is necessary is a clear description of the device,

FIG. 146.—LILIUM MRS. R. O. BACKHOUSE.
(*L. Hansonii* × *L. Martagon*).

without going into any details. In the majority of cases, it may be mentioned, the provisional specification is the most useful.

On the application itself a fee of £1 is payable, and if it is accompanied by a complete specification a fee of £3 will have to be paid on that in addition. For a provisional specification no fee is payable, but it is understood that unless a complete specification, together with a fee of £3, is sent within nine months from the date of an application accompanied by a provisional specification only, the application for the patent has been abandoned.

After the application and the specification have been examined and accepted, and on the acceptance of the complete specification, the Controller advertises the acceptance and the specification is open for public inspection.

During a period of two months from the date of this advertisement, anyone who considers that a patent ought not to be granted in respect of the invention in question must give notice of his opposition to the grant; assuming, however, that there is no opposition or that if there has been one it has been successfully disposed of, a patent will be granted to the inventor. Except

in cases where there has been an opposition and an extension allowed, the patent must be sealed within eighteen months of the date of the application. For the sealing of the patent a form must be obtained from the Patent Office and stamped with £1 fee stamp; this should be filled up and left at the Patent Office so that it may be sealed.

Once a patent has been obtained the owner is given the exclusive right of reproducing the invention in question for a period of sixteen years. During this period, however, he must still continue to pay fees for his right to the monopoly. From the fourth year of his patent he will have to pay annual fees rising from £5 to £15, the fee being increased each year by £1.

If during this period of sixteen years anyone infringes the exclusive right of the patentee without his consent, he can bring an action for an injunction, which is an order preventing the wrong doer committing any further infringement, and in addition he can, in certain cases, obtain damages from the infringer for the loss that has been sustained.

An injunction will be granted in every case in which it can be shown that an infringement has taken place; damages, on the other hand, can only be obtained where it can be shown that the wrong doer knew that he was infringing someone's rights, so that if the infringement was innocent no damages will be awarded.

Even though the creator of a useful device thinks that he cannot obtain a patent without outside help, there is no reason why he should not employ someone else to secure the necessary protection for him; a reliable patent agent will carry through the whole business. I have written "reliable," for in most businesses and professions there are "sharks" and the patent agency business is not immune. *H. A. S.*

UNEMPLOYMENT INSURANCE AND THE HORTICULTURAL WORKER.

A QUESTION of no little interest to all horticulturists and workers was raised recently in the law courts; the question of whether or no people employed by horticulturists and nurserymen in preparing their products for sale, and in work in connection with the marketing of these products, were excepted from the provisions of the Unemployment Insurance Act of 1920—as being employed in agriculture—which term in this Act includes horticulture.

In the case in question a man and five women were employed by the nurserymen to select and bunch flowers and grade fruit and Tomatos and similar work, the business of the man being to superintend the work of the five women.

From previous cases and from the decision in the present case on this subject, it appears that the fact that a man is employed in getting the goods ready for the buyer does not prevent him from being employed in horticulture; and if this is so, in order to determine, in such cases, whether unemployment insurance will have to be paid or not, seems to depend on whether the worker has to possess any particular knowledge of the products he is dealing with to carry out his work properly. Thus in a previous case it was decided that men employed in separating and purifying seeds were considered as being employed in horticulture, but a milk roundsman who merely sells the milk and neither knows nor has any need to know anything about its production, could not be considered as being employed in agriculture.

A general rule for determining whether such persons could be said to be employed in horticulture or not was laid down thus: Persons are employed in agriculture and horticulture when employed upon any operation done about the production, preparation, or transfer of the products of the farm or garden or orchard in the best saleable condition to a first buyer or salesman, or agent for sale, if one be employed, or to a distinct business under one proprietorship. But if the industrial status and occupa-

* *Garden*, July 6, 1895, p. 11.

tions of the employed persons are such that, though they are working about or in connection with a farm or garden or orchard, they may properly be said to be essentially pursuing their own special occupations, they are not employed in agriculture or horticulture within the meaning of this rule. H. S.

NOTICE OF BOOK.

Common Wild Flowers.

THOSE who are commencing the study of botany by collecting specimens of wild British plants will find Mr. T. Ernest Waltham's new book* particularly helpful because the line drawings and descriptions of the common wild plants of field and forest, bog and hedgerow render identification a very easy matter. One-hundred-and-eighty species are described and illustrated, and as description and illustration together occupy one page only in each case, the arrangement is a very convenient one, especially for children who are learning to take an interest in our native flora. Thirty-nine genera are represented, and as a frontispiece there is a colour chart showing six colours. The colour names may be all right from the point of view of an artist like Mr. Waltham, but we believe few people would regard his purple, violet and mauve as correctly representing the hues generally recognised under these names.

The author, who is well-known to our readers in connection with the coloured plates that have appeared in *The Gardeners' Chronicle*, has contributed the text as well as the illustrations, and in the former he gives the Natural Order, botanical name, and the British, French and German common names of the plants he illustrates. Interesting information is also given in regard to the pressing and preservation of herbarium specimens, and Mr. Waltham discusses at some length the use of Fuller's earth as a drying medium. Additional notes on poisonous and edible plants appear at the end of the book, and there is a very useful index.

THE PUBLIC PARKS OF SWANSEA.

SOME twenty years or so ago, I had an opportunity of inspecting the public parks of Swansea. It was soon after the appointment of the present General Superintendent, Mr. D. Bliss, and I came away with a feeling of disappointment that the townsmen of such an important town as Swansea should take so little heed of their opportunities for developing their parks and open spaces. There were several parks, but in no single instance had any attempt been made to make them attractive or interesting, neither did anything appear to have been done towards providing facilities for games in the public enclosures.

Quite recently I visited Swansea again and found a very great change. Not only are there more parks and open spaces, but there was displayed on every hand instances of very considerable progress and gardening ability. Distinct horticultural features have been introduced into a number of the parks, such as Rose gardens, herbaceous collections, rock gardens and what not, while there were extensive displays of popular flowers such as Sweet Peas, Delphiniums, Violas and Dahlias. Further, areas had been set apart for games and there were excellent bowling greens, hard and grass tennis courts, cricket and football grounds, miniature golf courses and children's playgrounds.

What, however, impressed me most of all was the innovation made in Singleton Park, where a walled garden had been devoted to a collection of economic plants, hardy and tender and to a collection of British plants.

Singleton Park, formerly the property of Lord Swansea, was acquired by the Corporation a few years ago. The mansion, with an area

of garden ground in the immediate vicinity, was made over for the home of the Swansea University, the remainder of the extensive grounds being retained for a public park. A considerable portion of the park is maintained in a natural state. The ornamental garden near the house, which originally contained amongst other interesting trees and shrubs, a good collection of Himalayan Rhododendrons, is being remodelled; common shrubs are being cut away to give space to the more valuable plants, and new and interesting trees and shrubs are being planted. Peat-loving shrubs are prominent, and there is talk of a collection of Lilies. A Bamboo collection is another feature.

A quarter-of-a-mile or so away from this part of the park is the old-walled kitchen garden, within which stands a second enclosure with plant houses and about an acre of garden ground. The larger garden has been turned into a nursery for trees, shrubs and herbaceous plants for furnishing the other parks, whereas the smaller enclosure has been utilised for a scientific collection of plants. One of the plant houses is used as a conservatory, the others are devoted to tender plants of economic value. Nearly two hundred kinds of plants are to be seen in these houses, embracing all the better-known useful tender plants, of which, Sugar, Tea, Coffee, Cocoa, Para Rubber, Pepper and Ground Nut are examples, with many lesser known subjects. I was informed that there is an intention to go a step further by repairing a large greenhouse at present not in use, and planting out as many as possible of the more important plants. Out-of-doors there are between 300 and 400 species of trees, shrubs and herbaceous plants, that are of economic value. In order that the collection may be used by the general public, a catalogue has been prepared giving scientific and common names, the part of the plant used and the uses, and this is sold for the modest sum of twopence. At the end are lists of British plants that are, or have been, used for food, textiles, medicine or other purposes.

In the same garden a collection of British plants has been arranged in a series of beds, rockeries, swamps and pools. A very considerable number of the plants found wild in the British Isles has been got together and is constantly receiving additions. The Corporation, in looking after their own collections, are not unmindful of the wants of other institutions, for a large number of seeds are collected each year, a seed list printed and distributed to home, continental and other establishments. By this means a large number of packets of seeds are distributed.

A beginning has been made in the establishment of an economic museum, wherein it is intended to display the products of the kinds of plants grown in the garden.

Although the garden has only been established some three or four years, it has already out-grown its quarters, and more space is required. One unfortunate fact is connected with this special garden; it is rather difficult to find and it would be a great advantage to casual visitors if a more prominent entrance could be arranged.

The Corporation of Swansea is to be congratulated upon the progress made in their parks during the last twenty years, and particularly in the development of the scientific garden in Singleton Park, which is probably unique in municipal parks in this country. It is further to be congratulated on having a Superintendent such as Mr. Bliss, who so worthily carries out their wishes. That other Corporations are alive to the value of the training received in the Swansea Parks is evidenced from the fact that the Superintendents of Parks of such important towns as Blackpool and Salford were a few years ago Assistants in the Swansea Parks, whilst within the last few weeks a Swansea Parks Assistant has been appointed Superintendent of Parks at Bath.

In addition to looking after the Corporation's interest in their parks, Mr. Bliss has charge of the cemeteries, foreshore and publicity work connected with the town, therefore his assistants have the opportunity for becoming many-sided men. W. Dallimore.

A NEW RASPBERRY PEST.

DURING the past summer my attention has been directed to the life-history of a fly which is doing much harm to the fruit of the Raspberry. The insect itself is not new, but hitherto I have failed to find any evidence of its having been regarded as injurious. A few details of my personal observations may first be given. In July, when the fruits began to ripen, it was found that those at the base frequently failed to develop. They became dry, shrivelled and black, making the fruit unsightly. As larvae of the beetle which is known to infest cane fruit were seen, it was at first thought that they were the cause.

On August 1, however, about a dozen affected Raspberries were placed in a breeding chamber and watched. The large (beetle) larvae died, and for a time nothing was seen. After three weeks it was found that a great number of flies had emerged, and when the material was examined with a lens, larvae in all stages of development, together with pupae and the empty cases from which the flies had escaped, were found in large numbers. Here was material for the study of the entire life-history. Having thus succeeded in breeding out a score of flies,

FIG. 147.—PUPARIUM OF SCAPTOMYZA, GRAMINIS, FLN.

I determined to test my observations by collecting another series.

On August 19, diseased berries were again placed in a fresh, clean, breeding glass. With them were three large larvae, which soon died. The only other signs of life were two almost invisible eggs, evidently those of a small fly. On August 26 two fly larvae were seen, and the following days others came to view. On August 30, the material had to be left for ten days unobserved, owing to my absence from home, but when on my return I examined the tube there were (September 9) a dozen or more perfect flies, while other larvae were still to be seen. The puparia are about three millimetres in length, the body of the fly being also of the same dimensions. The wings, however, extend two millimetres beyond the posterior end of the body, so that the entire insect is five millimetres in length. One of the insects was allowed to escape on September 12, when it flew straight to the window with great vigour. Several others followed the moment an opportunity occurred. These were all of one species and could readily be distinguished from all the other kinds usually found in the house at this season by their small size and the length of wing. The insects fed freely on the Raspberry pulp in

* *Common British Wild Flowers Easily Named*, by T. Ernest Waltham, Oxford University Press, Falcon Square, E.C. Price 3s. 6d. net.

which they had been bred, so that we have here a confirmation of Sturtevant's remark that he has reared the fly from Tomatos and Potatos (presumably diseased). It would appear that in this country the fly is chiefly in evidence in the months of August and September. It was found in Sherwood Forest on August 30, 1912; in Bulwell Forest, Notts., on the 8th of

FIG. 148.—ANTENNA OF SCAPTOMYZA GRAMINIS, FLN.

caused by the larvae of the Raspberry beetle, but I gather from your article that it is caused by a different larva. I have, however, noticed for some years a little black fly on the Raspberry in May, and often wondered what it was."

Whether or not this fly, and that which attacks the fruits later, is one and the same, remains to be seen, but I have been carefully observing the "seedy Raspberries" submitted by Mr. Dixon, and have bred out a number of flies therefrom identical with those (*S. graminis*) which have done so much damage to my own fruit. Yet the material from Bromsgrove was, to all appearance, affected by the Raspberry beetle only. Of these larvae nearly all died, but at least one has pupated, and the puparium is not only absolutely different in size, colour and general appearance from that of the fly, but is still dormant, while those of the fly have been burst by the perfect imago.

It seems pretty clear that more than one brood can be brought off during the fruiting period. I am unable to state the exact number of days required for perfecting the life-cycle, but as diseased Raspberries placed in the breeding chamber on August 19 had yielded a large number of perfect flies before September 9, three weeks seems to be sufficient for the entire process.

The accompanying illustrations (Figs. 147, 148, 149, and 150) showing a puparium, antenna, wing, and frontal aspect of the head will, it is hoped, although greatly magnified, serve as aids to identification. They are all drawn from recently collected material, but have not been compared with the originals, if any have been published in earlier periodicals. *Hilderic Friend.*

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, Ante pp. 131-137).

(Continued from p. 313).

ENGLAND, S.

KENT.—The fruit crops generally are not very good. Apples, in some places, are yielding well. Plums were very poor; Sweet Cherries in some places were good, and Morello Cherries also were plentiful. Peaches were half-a-crop. Strawberries were a poor crop; the frosts

FIG. 149.—WING OF SCAPTOMYZA GRAMINIS, FLN.

sole cause of the mischief. Thus on August 24, I published in the *Birmingham Daily Post* some account of my observations, which brought a letter from Mr. Ralph Dixon of Bromsgrove, a large Raspberry grower.

"I was always under the impression (he wrote), 'having been so informed by experts, that the seediness at the base of Raspberries was

* *The Invertebrate Fauna of Nottinghamshire*, J. W. Carr, 1916, p. 474.

destroyed most of the blossoms. Gooseberries yielded heavily, and Raspberries were a bumper crop, the varieties Lloyd George and Pine's Royal being very good, but the latter does not fruit for two feet from the bottom of the canes. The question of the Strawberry is very difficult; we cannot get anything like the results we used to have; there does not seem to be any vigour in the plants. Our sub-soil is chalk. *J. T. Shann, Betteshanger Park Gardens, Easry.*

—One cannot write in high enthusiasm of a season so precarious as the present; late frosts, keen winds of a cutting nature during the flowering period of most fruits, and, to crown it all, a month or more of severe drought so soon as the flowers had set, could but result in a disastrous effect on the hardy fruits, and this is the more regrettable, as blossom was abundant in every case. Probably the Strawberry suffered most from frost and drought, and this crop was almost a failure in many gardens. Plums likewise could not endure such climatic conditions, while Pears suffered badly also. The Apple crop appears to have escaped fairly well, for the majority of the trees that have come under my observation are carrying good crops, though many fruits fell owing to drought. Currants, Gooseberries and Raspberries benefited by the bountiful rains. Our soil is variable, with a clay and stony loam subsoil respectively. *James Maye, 32, Wigtown Road, Eltham.*

FIG. 150.—HEAD OF SCAPTOMYZA GRAMINIS, FLN.

MIDDLESEX.—Apples generally are plentiful; the flowers were strong and bright sunny weather prevailed when the trees were in bloom so that the fruits set well. Pears are a good average crop. Soft fruits were plentiful, especially Raspberries, Gooseberries and Strawberries, while Black Currants were better this year than last. Peaches and Cherries were satisfactory, but Plums gave a light yield. The growth of most fruit trees is very satisfactory. The soil is light and gravelly. *H. Markham, Wrotham Park Gardens, Barnet.*

—We have an excellent crop of Apples, and the quality of the fruit is very good. Pears, on the whole, are very good. Plums were below the average quantity. The crop of Cherries was equal to the average. Of small fruits, Gooseberries, Red and Black Currants were all satisfactory. Raspberries have been extremely plentiful and of splendid quality. Strawberries, which ordinarily succeed well in this locality, were the worst crop I have ever known, due, I believe, to the late frosts and the excessively dry spring. Our fruit trees are growing in heavy soil on a substratum of clay. *James A. Paice, Sunnyfields Gardens, Mill Hill.*

—On the whole, the fruit crops are not quite so discouraging as in the past few years. The trees flowered most profusely, but the blossoms were rather later in

opening, and the severe frosts experienced in the spring destroyed many of the flowers. Apples are better than for several years, but certain varieties which are fairly consistent croppers here have failed, notably Lord Grosvenor and Rev. W. Wilks. Cox's Orange Pippin is a very thin crop. Pears are very scarce generally but Doyenné d'Ete bore the heaviest crop for years. We had but few Gooseberries and Currants, although in some gardens these fruits were plentiful. Raspberries were a wonderful crop, especially the variety Lloyd George. Strawberries were largely spoiled by the wet weather at the time the berries were ripening. Plums were very thin; we had just a sprinkling on wall trees. *Goe. H. Head, Fulwell Park Gardens, Twickenham.*

SURREY.—The weather being very dry in April and May, Plums, Pears and some Cherries that set well dropped, but those Plums and Cherries that remained were good. Apples in a grass plantation are doing rather better than those in the cultivated garden. Raspberries yielded heavily and Black and Red Currants also were very fine crops. We pinched out the tips of the current-year's shoots in May as there were a few aphides on them, and ever since these bushes have been clean and healthy. Gooseberries were not plentiful, but we have had some choice fruits. Peach and Nectarine trees cropped better and they were cleaner than they have been for several years. The soil is light and sandy; in some parts the subsoil is iron ore, in other parts gravel. *J. T. Weston, Hatchford End Gardens, Cobham.*

—There was a wealth of blossom on fruit trees, but 15° and 16° of frost were registered on successive nights when the trees were in flower and spoiled all prospects of a good set. Amongst Apples, Keswick Codlin, Mank's Codlin, Lord Derby, Warner's King and Norfolk Beefing set what appeared to be good crops, but many fruits fell when about the size of an egg. Dessert Apples are scarce. Pears are a total failure; a few varieties of Plums gave about half-a-crop; Apricots set a good crop but most of the fruits turned black after the frost. Raspberries, Black and Red Currants, were fairly plentiful, but Gooseberries were a very thin crop. Strawberries were better than last year, but do not do well in these gardens. Our soil is a deep alluvial loam by the side of the river Mole, and only about forty feet above sea-level. *Grigor Roy, Stoke D'Abernon Manor Gardens, Cobham.*

—Apples, Pears and Plums flowered well and set quite freely, Plums being exceptionally good. Strawberries were retarded in growth and the first fruits affected by dry weather; the second fruits were small and of poor quality. Black Currants and Raspberries bore heavy crops, and Raspberries were free from maggot. The gardens are over six hundred feet above sea-level and escaped the severe spring frosts. The soil is loamy sand. *James M. Grant, Grayswood Hill Gardens, Haslemere.*

—We have a good average crop of Apples; the varieties Warner's King, the Codlins, Newton Wonder, and a few other culinary varieties, are carrying heavy crops, and such dessert varieties as Worcester Pearmain, Cox's Orange Pippin, and King of the Pippins are well-cropped. Pears blossomed very freely, but many of the blooms were cut off during heavy hailstorms; trees on walls have an average crop, but fruits are scarce on the standard trees. Plums were very scarce on the standards, for although they blossomed freely they failed to set well; trees on walls carried fair crops. All small fruits have very heavy crops, with the exception of Strawberries, which were much below the average. *J. Collier, Gatton Park Gardens, Reigate.*

—The fruit crops in this locality are very uneven. Apples have about an average crop; Blenheim Pippin, Bramley's Seedling and other culinary varieties have cropped heavily. Plum trees bore a heavy crop of clean fruits. Gooseberries and Currants suffered severely where frost caught the tops of the bushes, otherwise they were very good. Raspberries were our

best crops and Strawberries our worst. Our soil is heavy clay, the district late and cold, so that few dessert Apples finish well here. *F. Jordan, Ford Manor Gardens, Langfield.*

(To be continued).

HOME CORRESPONDENCE.

A Method of Staking Freesias and Other Plants

—I wish to call the attention of fellow gardeners to a method of staking Freesias which I have practised for nearly twenty years. I cannot now recall where I got the idea from, but I have found it very effective, and others whom I have induced to adopt it have also agreed as to its efficiency. As it is rather difficult to describe, I have given a simple diagram (Fig. 151), which, with the help of the letterpress, will enable readers to follow the instructions. The double circle shows the flower pot, and the five small circles the stakes, while the straight lines illustrate the raffia. Five stakes are used at equal distances apart. A long piece of raffia or other tying material is then taken, and a start is made at stake No. 1. One end of the raffia is held at this point in the thumb and finger of one

FIG. 151.—METHOD OF STAKING FREESIAS.

hand, while with the other hand the raffia is passed along the outside of stakes No. 1 and No. 2. It is then continued to No. 4, passed on the outside of this and No. 5, then on to No. 2, and the outside of No. 3, then on to No. 5 and No. 1, then to No. 3 and No. 4, and on to No. 1, where the knot is tied. In this way all the stakes are enclosed, and a five-pointed star is formed, so that there are eleven enclosures into which the blades of the Freesias may be drawn and kept upright. It may at first seem intricate, but all one has to remember is to pass the raffia on the outside of two stakes, then miss one, over two more, miss one, and so on till the raffia is brought for the second time to 1, where a start was made. The raffia is not tied to the stakes, therefore, as growth lengthens, the whole of the arrangement may be raised to hold the foliage in place. This plan keeps the foliage and flowers of Freesias and various bulbs spaced out better than merely putting in four stakes and encircling them with raffia. The stakes over the outside of which the raffia should be passed are in the following order:—1, 2, 4, 5, 2, 3, 5, 1, 3, 4, 1. *William F. Rowles.*

Birds and Fruit.—I admit that birds do a great amount of good in the garden, but the good they do does not counter-balance the harm they do to fruits. It is disastrous to see three parts of the best fruits of Doyenné du Comice and Glou Moreau Pears spoiled by birds; these are grown on cordons on the walls and have been netted, but it requires quarter-inch mesh netting to keep the tits out, and this means a big outlay. We are now receiving attention from

starlings which cleared the fruits from two large Mulberry trees (to which I did not object), and are now concentrating their efforts on late dessert and cooking Apples (which I greatly resent). *A. B. Wadds, Englefield, Reading.*

[The fine fruits of Doyenné du Comice Pears sent by Mr. Wadds were badly pecked.—EDS.]

—It is, perhaps, with good reason gardeners fail to appreciate the good done by tits, therefore they consider ways and means of destroying the birds. In this district of North Wales tits are the most destructive birds we have; they particularly like Pears and are gluttons for Peas, stripping whole rows in an incredibly short space of time. Ordinary fruit netting is useless as a preventive, and the price of small-mesh netting is prohibitive on a large scale, therefore other means have to be taken. A good method of capturing the birds is to procure some mouse traps of the Nipper type; bait them with fairly old Peas, and place them among the spurs of the fruit trees or Pea sticks, to which the traps must be securely fastened. By this means I have caught many dozens of the marauders. *T. L.*

—I freely admit that birds do good in gardens, but, unfortunately, they also do a vast amount of damage. They not only attack fruits, but in many cases destroy the fruit buds. During the winter of 1926-1927, birds were most destructive in these gardens. It is well-known that bullfinches and sparrows are very partial to the buds of Plums and Damsons, but it was a new experience for me to find buds of Black Currants being attacked. If the damage had escaped notice the bushes would have been stripped in a few days, so thoroughly did these mischievous marauders do their work. It was not big-bud mite the birds were after, as our bushes are free from this pest. The damage is done just as the sap is rising and the buds commence to swell. The film from the protecting sprays is then released leaving the buds open to attack. It is a tedious process to fix strands of black thread over standard and pyramid trees, and everywhere this was done it proved to be of no avail, sparrows and finches treating such preventives with contempt. Flowers of Polyanthus are partially destroyed by sparrows and starlings. All tender vegetable seedlings have to be most carefully protected. A bed of August-sown Turnips was demolished by finches. Blue tits pecked holes in choice Pears under the protection of double netting and wasp-proof bags. Ornamental berried shrubs are stripped, in some cases before the berries attain their autumn colour. It would be most useful to hear of any practical suggestion (other than slaughter) by which birds may be prevented from carrying on such wholesale destruction. Surely the birds were not short of water this season! *C. Ruse.*

—I was greatly surprised when I read your correspondent's note (p. 294) stating that blue tits did not touch his fruit. What do they feed on that it is so enticing as to cause them to leave fruit alone? Here, they are easily the very worst pests; indeed, I regard them as far more destructive than rats, which, with perseverance, are easily controlled. Our annual loss caused by blue tits spoiling Apples and Pears is heavy. We net all the trees possible with two thicknesses of netting, but the pests find a way in, and (some) out again. I know that tits devour insect pests, but the latter are under our control; and strange to say, at any other period except when Apples and Pears are ripening, the tits are conspicuous by their absence. I have many trees with nice crops where all the best coloured fruits have a hole in them; tits never go to the same fruit the second time. *J. Kneller, Penrhyn Castle Gardens, Bangor.*

Seed Drying.—We have read with much interest your description of a seed-drying invention (p. 279), but we hardly look upon it as anything particularly new. It appears to be somewhat on the same lines as a drying apparatus we have had on our premises for some years, but from your description, the drying process referred to would appear to be rather primitive compared with our system. *Watkins and Simpson, Ltd.*

SOCIETIES.

ROYAL HORTICULTURAL.

OCTOBER 18 AND 19.—A wonderfully fine exhibition greeted the Fellows on the above dates. The big hall at Vincent Square was well filled with effective and interesting displays, and although it was the occasion of the Orchid Show, Orchids were not the only feature. There were grand groups of Orchids from trade and amateur growers, good displays of Michaelmas Daisies, early Chrysanthemums, Roses, stove plants, late border flowers, alpine plants, Roses, and a superlatively fine display of vegetables from Aldenham.

The Orchid Committee granted seven awards of Merit, and the Floral Committee four, including a retrospective one.

Orchid Committee.

Present: Sir Jeremiah Colman, Bt. (in the chair), Mr. Gurney Wilson (Hon. Secretary), Mr. C. J. Lucas, Mr. Sidney W. Flory, Mr. Arthur Dye, Mr. Fred K. Sander, Mr. A. McBean, Mr. H. S. Alexander, Mr. Charles H. Curtis, Mr. J. E. Shill, Mr. W. Hatcher, Mr. Robert Paterson, Mr. John C. Cowan, Mr. T. Armstrong, Mr. Fred. J. Hanbury, Mr. J. Wilson Potter and Mr. Stuart H. Low.

AWARDS OF MERIT.

Laelio-Cattleya Warrior (*C. Fabia* × *L.-C. Serbia*).—A showy Orchid with wide, clear mauve sepals and petals, and a big, frilled lip that is Tyrian-purple on the front portion and orange-yellow in the throat. The spike carried four fine blooms. Shown by Messrs. J. AND A. McBEAN.

Cattleya Princess Royal (*C. Fabia* × *C. Hardyana*).—A splendid Orchid with large, rich purple flowers, the flattish lip being a very rich, bright purple with an old gold throat. Shown by Messrs. J. AND A. McBEAN.

Laelio-Cattleya Valencia (*L.-C. Soulangé* × *C. Dinah*).—This has a large and finely-formed flower with very broad, purplish-mauve petals, and a handsome rosy-purple lip with a pale yellow throat; the lip is wide and prettily frilled. Shown by Messrs. J. AND A. McBEAN.

Laelio-Cattleya Mrs. Medo, *The Node* var. (*C. Venus* × *L.-C. Luminosa aurea*).—This effective, large-flowered hybrid has very substantial blooms of excellent form. The sepals and petals are a curious shade of bronzy-yellow, the former having deeper veining and shading at the sides and apex. The fine lip is ruby-coloured, with small, purplish-mauve side lobes. Shown by Mrs. CARL HOLMES (gr. Mr. Penton), The Node, Welwyn.

Cypripedium Gowerianum var. *Mrs. Leonard Dixon* (*C. Lawrenceanum Hyeannum* × *C. Curtisii Sanderæ*).—A beautiful form of a fine hybrid. The dorsal sepal is white with green stripes, the lip pale apple-green, and the petals green, shading to white at the tips, and studded with fine green hairs. Shown by Messrs. SANDERS.

Laelio-Cattleya Hilary (*L.-C. Soulangé* × *C. Fabia*).—In this beautiful hybrid the flowers are of fine size and wonderful substance. The sepals and petals are of a pleasing shade of purplish-mauve, while the waved and frilled lip is bright purple with mauve edge and golden veins in the throat.

Cattleya Fabia var. *Queen Elizabeth* (*C. Dowiana* × *C. labiata* var.).—A showy hybrid with broad, clear purple sepals and less broad petals of similar colouring. The big lip has a frilled and purplish-mauve margin, but the chief colour is ruby-purple, shading to purple, with old gold markings in the throat. Shown by Messrs. SANDERS.

GROUPS.

MESSRS. CHARLESWORTH AND Co. had a large and very beautiful group of Orchids in which the central feature was a fine display of well-grown *Dendrobium Phalaenopsis*, interspersed with spikes of *Odontoglossum crispum xanthotes*. At each end of the group there were collections of *Odontoglossums*, wherein conspicuously beautiful kinds were *O. grande*, *O. Phillips-*

ianum aureum, *O. Alvara*, *O. Dictune*, *O. Horus*, first-rate varieties of *O. crispum*, *O. Serapis*, *O. Crethus* and the old *O. Willekeanum aureum*, together with *Odontioda Acis*, *O. Vesuvius*, the very beautiful *Odontonia Alesia* and the small-flowered, but elegant, *Oncidioida Charlesworthii*. Between the *Odontoglossums* and *Dendrobiums*, and against a background of *Oncidium varicosum Rogersii*, were fine examples of the yellow *Laelio-Cattleya Pyramus*, *L.-C. Orebus*, *L.-C. Cynthia*, *L.-C. Miranda*, and *L.-C. Soulangé*, together with *Brasso-Laelio-Cattleya Mercia*, *Brasso-Cattleya Mrs. Chas. Marron*, *B.-C. Viscount Toda*, *Cattleya amabilis* and *C. amabilis alba*. Other interesting plants in this fine exhibit were *Miltonia Princess Mary*, *Coelogyne Brymeriana*, with two long spikes; the pale yellow *Spathoglottis edinensis*; the quaint *Dendrobium Coelogyne*, with a black lip; *Cypripedium Maudiae* and *Vuystekeara rubra*.

Another large exhibit was the one from Messrs. SANDERS, in which the plants were thinly disposed so that the whole of each specimen could be seen. *Oncidium tigrinum* was used as a background to a fine lot of *Cattleya Fabia* in variety, while another grouping consisted of *Vanda coerulea*, *Cattleya Hardyana* and *C. Sylvia*. *Laelio-Cattleya Carmincita* was finely represented, as also were *L.-C. Regina* var. *Cloth of Gold*; the yellow *Cattleya Veiris*, *Brasso-Cattleya Fusilier*, and the pure white *Cattleya Shrewsbury*. Other good things in this display included several examples of *Cypripedium Fairrieianum*, the bold *C. Gowerianum* var. *Mrs. L. Dixon*, *Angraecum Ellisii* with two spikes of its long-spurred, white flowers; a fine example of *Rodriguezia secunda*, with eight spikes of its rosy flowers; the old and rarely seen *Barkeria spectabilis*; *Oncidium citrinum*, and the fine *Cymbidium Tracyanum*.

MESSRS. J. AND A. McBEAN had a very pretty exhibit, and arranged all their plants over green moss. The plants were all admirably arranged, and a few outstanding specimens were those of *Laelio-Cattleya Warrior*, *L.-C. Valencia*, *L.-C. Profusion* in variety; *Cattleya aureata*, *C. amabilis alba*, *C. Fabiata*, *C. Fabia alba*, *C. Hardyana* and the golden *C. Aeneas*, *C. aurea* and *C. Amur*. *Odontioda Bradshawiae* was represented by a large-branched spike, as also was *Odontoglossum Jasper*, while *Oncidium incurvum*, *O. Forbesii*, *Odontioda Devossiana*, *Odontoglossum Theseus*, *O. Beulah* and *O. Uro-Skinneri* var. *Black Prince* were other good subjects. *Cypripediums* of good quality were also included and among smaller subjects we noticed *Cochlidia Noezliana*, *Epidendrum vitellinum majus*, *Sophrontitis grandiflora* and *Miltonia Wm. Pitt*.

MESSRS. STUART LOW AND Co. associated their Orchids with Ferns and small Palms, and made up a very pretty exhibit in which there were capital examples of *Laelio-Cattleya Haroldianum*, *L.-C. Cantab.*, *L.-C. Ortega*, *L.-C. Profusion*, *L.-C. Herald*, *Cattleya amabilis alba*, *Sophr.-Laelio-Cattleya Goodsonii*, with three of its crimson flowers; *Brasso-Laelio-Cattleya Baroness*, *Cymbidium Orion*, *Angraecum Ellisii*, *Vanda coerulea*, *Dendrobium densiflorum* and the very pretty, little *Laelia Dayana delicata*.

Mr. HARRY DIXON contributed numerous *Cypripediums* and examples of *Brasso-Cattleya Nestor*, *Cattleya amabilis alba*, *Oncidium incurvum album*, and *Odontioda Beechense*.

MESSRS. J. CYPHER AND SONS' exhibit consisted chiefly of *Cypripediums*, and in their collection we noticed good examples of *C. Madame A. Fevrier*, *C. Fair-Maud*, *C. Ballet Girl*, *C. Felicity*, *C. Olivia*, *C. Royal George*, *C. Maudiae* and *C. Germain Opoix*. *Odontoglossum grande*, *Oncidium varicosum Rogersii*, *Cattleya Enidsonii* and the old *C. Bowringiana* were also exhibited.

A bold exhibit of well-grown plants was staged by Messrs. COWAN AND Co., who displayed their plants over a groundwork of green moss and Ferns. Graceful spikes of *Oncidium varicosum Rogersii*, *Odontoglossum Pescatorei* and *O. crispum xanthotes* formed a charming background for *Cattleya Mantinii*, *C. Fabia*, *C. Omar*, *C. Daedalus*, *Laelio-Cattleya Queen Mary*, and the handsome *L.-C. Hilary*, which is derived from *L.-C. Soulangé* and *C. Fabia*. *Coelogyne Mooreana* was represented by a plant with two spikes,

and there were also capital examples of *Cypripedium Warrior*, *C. Mastiff*, *C. Stamperland*, *C. Thalia* var. *Mrs. Wellesley*, *C. Bedfordiae*, *C. Prince Albert* and *C. Troilus* var. *Imperialis*; *Odontoglossum Col. Leith* was also shown; this is the result of crossing *O. Rossii* with *O. Uro-Skinneri*; we also noticed a plant of the interesting, but small-flowered, *Acampe papillosa*, with axillary spikes of small green and white flowers.

MESSRS. A. J. KEELING AND SONS exhibited a few Orchids, and among these the most notable were *Cattleya Mrs. Medo* var. *Brilliant*, with yellow sepals and petals and a brilliant ruby lip; *Brasso-Cattleya Nestor* and *Cypripedium Lydia*. Messrs. BLACK AND FLOREY showed *Laelio-Cattleya Edzell* and its shapely *Langley* variety; *Brasso-Cattleya Alderman*, *Brasso-Laelio-Cattleya Vera*, the brilliant *Sophr.-Laelio-Cattleya Eros*, and a small plant of *Miltonia Sanderiana*. Messrs. SUTTON BROS. also exhibited a few Orchids, while BARON BRUNO SCHRÖDER (gr. Mr. Shill), Dell Park, Englefield Green, showed cut flowers of two new yellow-flowered *Brasso-Cattleyas*.

The Orchid Challenge Cup, offered for the best exhibit arranged by an amateur on a space not exceeding sixty square feet, was awarded to J. J. JOICEY, Esq. (gr. Mr. J. Mackay), The Heights, Witley, Surrey, for a capital exhibit of well-grown plants, all well-arranged. Conspicuously good were *Vanda Sanderiana*, *Vanda coerulea* (one of the plants carrying three spikes), *Brasso-Cattleya British Queen* var. *Admiration*, the delightful *Pleione lagenaria*, *Cypripedium Fairrieianum*, *C. insigne Sanderæ*, *C. Boltonii*, *C. Madame A. Fevrier*, *Cymbidium Tracyanum*, *Miltonia Beau Brummel*, and the old, small-flowered *Selenipedium Schlimii*.

Sir JEREMIAH COLMAN, Bt. (gr. Mr. J. Collier), Gatton Park, Reigate, had an interesting group in which there were large specimens of *Cattleya Browniae superba*, *C. Bowringiana lilacina*, *C. labiata coerulea* and *Cypripedium Maudiae*. There was also a cut spike of *Vanda Luzonica* and pretty plants of *Promenaea citrina*; the curious *Bulbophyllum virescens* and *Cirrh-petalum ornatissimum*.

Floral Committee.

Present: Section A.—Mr. Henry B. May (in the chair), Mr. J. F. McLeod, Mr. A. Turner, Lady Beatrix Stanley, Mrs. Ethel M. Wightman, Mr. Donald Allan, Mr. J. M. Bridgeford, Mr. D. Ingamells, Mr. Hugh Dickson, Mr. Courtney Page, Mr. R. Findlay, Mr. James B. Riding, Mr. W. B. Gingell, Mr. A. E. Vasey, Mr. D. B. Crane, Mrs. Helen Lindsay Smith, Mr. Charles E. Pearson, Mr. E. R. Janes and Mr. W. D. Cartwright, Secretary.

Section B.—Mr. Gerald W. E. Loder (in the chair), Mr. W. J. Bean, Mr. R. C. Notcutt, Hon. Henry D. McLaren, Mr. James Hudson, Mr. George Harrow, Mr. F. G. Preston, Mr. Arthur Bedford, Mr. T. Hay, Mr. E. A. Bowles, Mr. Charles T. Musgrave, Sir William Lawrence, Bt., Mr. C. J. Lucas and Mr. N. K. Gould, Secretary.

AWARDS OF MERIT.

Chrysanthemum Mrs. F. C. Maples.—This is a handsome Japanese variety of the best exhibition type and size. The flower is made up of very broad florets of bright yellow colour. The flowers are broad and deep and an occasional floret curls gracefully, adding charm of outline to the blooms. Shown by Mr. E. H. PEARCE, Long Sutton Gardens, Basingstoke.

Chrysanthemum Pinkest.—A valuable Japanese variety of the size valued for marketing purposes. The round blooms are compact and the stiff florets are lightly rolled. The colour is a deep mauve-pink. Shown by Mr. H. SHOESMITH, junr.

Nerine Wales.—This handsome variety was sent to Wisley for trial by the late Rev. JOSEPH JACOBS. It has a large umbel of orange-red flowers which have a flushing of rose. The ends of the floral segments are gracefully undulated. Sent by the DIRECTOR, R.H.S. Gardens, Wisley.

Helianthemum Libanotis var. *latifolium*.—On June 15, 1926, an Award of Merit was given to "*Halimium libanotis*," subject to verification

of name. We are now informed that Dr. Otto Stapf has decided that the name should be *Halimium Libanotis* var. *latifolia*, and the award has been confirmed. According to the *Index kewensis*, *Halimium Libanotis* is, correctly, *Helianthemum Libanotis*. The plant under notice is a broad-leaved variety of the species which is nearly allied to *Helianthemum umbellatum*, but differs in having terminal yellow flowers, usually solitary, with smooth sepals. Shown by Sir OSCAR WANBURG, Headley, Epsom.

FOR TRIAL AT WISLEY.

Aster Silver Spray.—A very graceful *A. cordifolium* variety which bears arching sprays of comparatively small flowers which are white with the slightest suggestion of a lavender blush. Shown by Mr. ERNEST BALLARD.

GROUPS.

The several collections of *Chrysanthemums* were composed of very bright and attractive flowers. Mr. A. G. VINTEN had a considerable group of disbudded blooms of the type which finds a ready sale in the markets. We understand that these grand blooms were gathered from the open ground where they had received occasional protection by means of overhead rollers of tiffany. The chief varieties were *Almirante*, *Mayford Yellow*, *Red Almirante*, *Royal Salute*, Mrs. E. Arkwright and Mrs. Hutt.

An entire length of tabling immediately inside the hall was filled with *Chrysanthemums* by Messrs. KEITH LUXFORD AND Co., and Messrs. YANDELL. The former had a very graceful display in which we especially noted *Harry Clements*, large yellow; *Thalia*, crimson with a gold reverse; *Pink Delight* and *Cranford Pink*, amongst the disbudded varieties; and *Cranford Cream*, *Phoenix*, *Harvester*, Mrs. Jack Pearson and *Crimson Circle* of the spray varieties. Mr. YANDELL had nearly all spray varieties, of which *Goldfinder*, *Phoenix*, Mrs. Phil Page, *Hubert* and *Delice* were very attractive. *Sanctity* and *Armored* well represented the disbudded type.

Trees and shrubs bearing autumn colouring also were a bright display. Messrs. J. CHEAL AND SONS had an extensive exhibit in which there were large sprays of *Quercus rubrum*, *Acer japonicum laciniatum*, *A. rubrum*, *Ribes americanum*, *Berberis Thunbergii* and *Euonymus alatus* in most beautifully coloured sprays. *Rhus Cotinus* and *Berberis Autumn Cheer* provided gorgeous colour in the interesting exhibit of Messrs. R. VEITCH AND SON, who also showed *Arbutus Unedo rubra*, *Colletia armata*, many spikes of *Nerine Bowdenii* and the *Belladonna Lily*.

Michaelmas Daisies were shown in considerable quantity. In a large floor group Messrs. BARR AND SONS displayed many sprays of their admirable variety *Barr's Pink*, with *Hilda* and *Nancy Ballard*, two good pink sorts with smaller flowers, and also *Blue Gem*, Mrs. George Monro, white; *Rachel Ballard*, rosy-mauve; *Little Boy Blue*, *Pink Perfection* and *Mons*.

In an adjoining group, Mr. T. BONES showed *Pink Perfection*, *Sirius*, *Mons*, *Little Pink Lady*, *Sonia* and a good *Aster Amellus* seedling, all of varying shades of pink.

As a background to their collection of miscellaneous border flowers, Messrs. BAKERS, LTD., had goodly stands of unnamed varieties of Michaelmas Daisies, which well set off the vases of *Kniphofias*, *Heleniums*, *Delphiniums* and other flowers. Tall stands were filled by Messrs. WM. WOOD AND SONS with good sprays of *Climax*, *Beechwood Pink*, Mrs. George Monro, *Acme* and other good Michaelmas Daisies.

In the annexe, Mr. ERNEST BALLARD had an attractively arranged collection of Michaelmas Daisies which included tall stems of the graceful variety *Silver Spray*, *October Dawn*, *Blue Gem*, Mrs. George Monro, *Empress of Colwall*, double mauve; *Dick Ballard*, double rosy-mauve; *Powder Puff*, double old rose; and *Ruby Tips*.

A number of good hybrids of the tall-growing *Lobelias*, shown by Messrs. B. LADHAMS, LTD., illustrated desirable advances in colouring, especially in the rose-pink shades. They also staged vases of *Coreopsis auriculata superba*, *Lavatera Olbia*, *Salvia uliginosa* and *Meconopsis* in variety, with sprays of hardy shrubs. The Misses HOPKINS had a pretty little rock garden,

suitably planted, while in a larger rock garden, Mr. F. G. WOOD displayed *Viola Ashted Purple*, some early-flowering Primroses, *Gentiana sino-ornata* and other subjects, and also showed herbaceous flowers. Messrs. ISAAC HOUSE AND SON continue to display excellent flowers of their *Scabiosa caucasica* varieties, with *Scabiosa anthemifolia*, *Kniphofia erecta*, *K. Etna* and *K. grandis globosa*. Mr. J. J. KETTLE had a good collection of sweet Violets which included the varieties *Princess Mary*, *Princess of Wales* and *Lady Shaftesbury*. Messrs. REAMSBOTTOM AND Co. had a good range of their *St. Brigid Anemones*.

An admirable display of Dahlias was made by Messrs. DOBBIE AND Co. Chief amongst the Collette varieties were *Glen Devon*, deep rose with white quills; *Glencoe*, deep scarlet, with scarlet and white quills; *Glen Sannox*, bright scarlet, with white quills; and *Aaron*, bright rose with white quills. The useful miniature *Paeony*-flowered type was also well represented, and these varieties included *Our Annie*, *Chelsea* and *Joan Fife*. Mr. J. T. WEST also contributed very good Dahlias, and his collection included *Treasure* and *Ophelia* of the miniature *Paeony*-flowered section, and *Shining Sun*, *Lady Godfrey*, *Faucett* and *Blanche Rowland* of the small Decoratives. Dahlias and Roses were shown by Messrs. RICH AND COOLING.

Roses were staged in considerable beauty by several growers. Mr. GEORGE PRINCE had a handsome collection which included vases of *Madame Butterfly*, *Lady Inchiquin*, *Golden Emblem*, *Shot Silk*, *Covent Garden* and *Ophelia*. The chief varieties set up by Messrs. B. R. CANT AND SONS were the rich yellow *Cecil*, *Etoile d'Hollande*, Mrs. Beatty, of rich golden colour; *Isobel*, Mrs. George Norwood and *Lady Inchiquin*.

In his collection of Roses, Mr. J. H. PEMBERTON included a number of free-flowering varieties such as *Pax*, *Vanity*, *Felicia* and *Cornelia*, and also staged vases of *Los Angeles*, *Mermaid* and other H.T. varieties. The tall pillars arranged by Messrs. D. PRIOR AND SON contained good blooms of *Hugh Dickson*, *Sunstar*, *Los Angeles*, *Madame Edouard Herriot*, *Shot Silk* and *Madame Abel Chatenay*.

An attractive exhibit from the DUKE OF WELLINGTON (gr. Mr. H. Beckingham), Ewhurst Place, Basingstoke, was made with *Nerine Bowdenii*, *Amaryllis Belladonna*, *Humea elegans* and fruiting sprays of *Pernettya mucronata*. In a corner, Messrs. L. R. RUSSELL, LTD., made up a very graceful group with well-grown plants of *Alocasias*, *Anthuriums*, *Codiaeums* (Crotons), various *Bromeliads*, *Aralia elegantissima*, *Adiantum Glory of Moordrecht*, and *Fittonias*.

Carnations of the accustomed quality and quantity were staged by Messrs. C. ENGELMANN, LTD., Messrs. STUART LOW AND Co., and Messrs. ALLWOOD BROS. The first-named included vases of *Orange Sunstar*, *Spectrum*, *Red Laddie* and *Dorcas*. Messrs. STUART LOW AND Co. gave prominence to *Melchet Beauty*, an attractive Fancy variety, *Betty Low*, of vivid rose-cerise colour, *White Pearl* and *Philip Sassoon*. In the annexe, Messrs. ALLWOOD BROS. staged vases of *Topsy*, *Laddie*, *Red Laddie*, *Jessie Allwood* and *Maud Allwood*, with a front row of *Dianthus Allwoodii*.

There were two very interesting collections of *Sempervivums*. In connection with Dr. R. Lloyd Praeger's lecture, the Director of the Royal Botanic Gardens, Kew, sent pot plants of many new or rare species and varieties. Amongst the plants were those named *Aeonium holochrysum*, *A. arboreum* var. *purpureum*, *A. balsamiferum*, *Monanthes polyphylla*, *M. muralis*, *Greenovia aurea* and *G. aurea* × *aizoon*. H. T. WEEKS, Esq., Northayke, Rusthall Park, Tunbridge Wells, showed in a pleasantly-designed little rockery, good examples of *Sempervivum arachnoideum minus*, *S. Pomelii*, *S. Pregnarium*, *S. Webbium* and *S. triste*.

Fruit and Vegetable Committee.

Present: Mr. C. G. A. Nix (in the chair), Mr. J. Cheal, Mr. P. C. M. Veitch, Mr. George F. Tinley, Mr. George Kelf, Mr. A. Poupard, Mr. H. Markham, Mr. W. H. Divers, Mr. E. A. Bunyard, Mr. E. Beckett and Mr. A. N. Rawes, Secretary).

Mr. W. F. MACEY, Donnington Road, Worcester Park, showed a seedling Apple, much after the style of *Allington Pippin*, but not so good; another seedling Apple came from Mr. J. W. BOYCE, Welney, Norfolk, which appeared rather to resemble the old Norfolk Beefing type. Mr. A. MALPASS, Fleet, Hampshire, showed a seedling Apple named *Malpass Seedling*, which was considered no advance upon existing varieties of similar type and season. Sir WILLIAM LAWRENCE, Bt., Burford, Dorking, exhibited two varieties of Celery, the *Fordhook* and the *Self-blanching Golden Plume*. These varieties are grown in Canada and the Northern United States of America, practically to the exclusion of other sorts; neither Celery requires to be earthed up or wrapped in paper bands. *Golden Plume* is ready for consumption in October-December, while *Fordhook* is lifted and stored in a frost-proof shed for use in the New Year.

GROUPS.

Mr. R. C. NOTCUTT staged a splendid collection of Apples and Pears, the exhibit being tastefully decorated with various berried shrubs. Interesting varieties were *Cullen Grise* (a promising "market" Apple), *Guelph*, *Bismarck*, *Herring's Pippin* and *Lord Rosebery*—all comparatively new introductions of merit. Other good dishees of Apples were *Peasgood's Nonesuch*, *Ellison's Orange*, *Blenheim Pippin*, *Cockle Pippin*, *Annis Elizabeth* and *Crimson Bramley*. Among Pears *Pitmaston Duchess*, *Conference*, *Marie Benoist* and *Catillac* were noted as of outstanding quality and good size.

A magnificent exhibit of vegetables was arranged by the Hon. VICARY GIBBS (gr. Mr. E. Beckett), Aldenham House, Elstree. It is rather difficult to state that any one of the Aldenham exhibits is better than has ever been shown, but we certainly think this was the finest we have ever seen. Against the trellis background were arranged coloured *Runner Beans*, superb *Leeks*, *Capsicums* and *Chilies*, *Tomatos*, *Celery* in variety and of first-rate quality; *Cauliflowers*, *Beets*, *Aubergines* and *Red Cabbage*. In the foreground abundant colour was supplied by *Tomatos* in great variety, *Capsicums*, splendid *Carrots*, *Long Beet*, coloured *Potatos*, *Onions*, yellow *Turnips* and *Radishes*; white *Potatos* were equally well shown, and there were very fine specimens of *Ailsa Craig Onions*, *Cardiff Castle* and *Ideal Cucumbers*, *Holborn Exhibition*, *Filbert* and *Dwarf Gem Brussels Sprouts*, together with *Salsafa*, *Black Spanish Radish*, *Shallots*, *Mushrooms* (as growing), white *Cucumbers*, *Florence Fennel*, *Celeriac*, *Vegetable Marrows*, *Lettuces*, *Savoys*, *Curled Kale*, white and Chinese *Artichokes*, *Spinach*, *Maize*, *Chicory*, *Endive*, *Globe Artichokes*, *Long and Round Turnips*, *The Bell* and *Selected Gladstone Peas*, and even *Mustard* and *Cress*. There was not a weak dish in the whole of this large and superb exhibit.

BIRMINGHAM AND MIDLAND GARDENERS'.

THE first meeting of the autumn session took place on Monday, October 10, at the offices of the Chamber of Commerce, New Street, Birmingham. The President, Dr. Jessie Bayliss Elliott, as in former years, delivered the opening lecture, and chose for her subject "The Fungus Guests of Orchids and Other Plants." The lecture was illustrated with lantern slides.

Needless to state, such a subject given by so eminent an authority as Dr. Elliott of the Birmingham University proved highly instructive, and the lecture was fully appreciated.

The Association reports healthy progress; thirty new members were admitted during the winter of 1926-27, and ten new members nominated for election at the opening meeting, on October 10. Several places of interest were visited during the summer months, and a scheme is being arranged under which prizes and certificates will be awarded for the best essay given upon the series of lectures attended during 1927 and 1928.

The Chairman appointed for the fortnightly meetings is Mr. Joseph Smith, Superintendent of the Parks and Cemeteries Department of the city.

NATIONAL AURICULA.

(NORTHERN SECTION.)

THE Annual General Meeting was held at Houldsworth Hall, Manchester, on Saturday, September 24, 1927. Mr. C. W. Needham presided. There was a good attendance of members. Sir Daniel Hall was elected a Vice-President.

The Secretary, in his report for the year, mentioned that fourteen new members had joined since the last show. As the result of the report of the show, which appeared in *The Gardeners' Chronicle*, he had received numerous letters from various parts of the country, all showing the increased interest now being taken in the Auricula. The new *Annual Record* of the Society will be ready about the end of October and will contain a long and interesting account of the early history of the Auricula, and an illustrated article on cross-fertilisation. Copies may be had from the Secretary, Mr. C. F. Faulkner, 2, Booth Street, Manchester, price one shilling each.

The Chairman gave an interesting account of the John Innes Institute, setting forth its recent intention to preserve and cultivate the old florists' flowers because, amongst Auriculas especially, many standard varieties of great merit as well of historic interest are disappearing. It is of the utmost importance in the interests of floriculture generally that the old types of flowers representing the efforts of a long line of florists should be maintained. He appealed to members for their support, asking them to send plants of the present and of the old-time types, and especially of the older sorts that are becoming obsolete, to the Director of the John Innes Institute, who promised them a hearty welcome and a happy home.

The fifty-sixth annual show will be held on April 28 or May 5, 1928, the choice of dates being left to a ballot of members nearer the time.

NATIONAL CHRYSANTHEMUM.

At the meeting of the Floral Committee held at the Royal Horticultural Hall, Westminster, on Monday, October 10, the following Certificates were granted to novelties:—

FIRST-CLASS CERTIFICATES.

Bonnie Lass. II. 1b.—A useful early variety with shapely flowers of a soft pink colour, the small central florets being tipped with greenish-gold.

Torch. II. 1b.—A chestnut-bronze variety with gold reverse. Flowers of good size and form and borne on long, stiff stems which, like the foliage, are dark.

Purple Robe. II. 1b.—A very distinct variety shown now in better form and colour than a year ago. The flowers are of medium size and good in spray form, and the colour is rich claret-purple, the ruddy hue being brightest on the young flowers. The foregoing three varieties were shown by Mr. A. W. THORPE, Lichfield.

Daffodil. II. 1b.—A very fine, early, golden-yellow variety of compact reflexing form. Shown by Mr. H. SHOESMITH, Junr.

Sungold. II. 1a.—This is a handsome, large-flowered, decorative variety of Japanese form, with broad florets that are rich golden-yellow, faintly shaded or speckled with chestnut-red. Shown by Messrs. KEITH LUXFORD AND Co.

At the meeting of the Floral Committee, held at the Royal Horticultural Society's Hall, Westminster, on October 17, the following novelties were certificated:—

FIRST-CLASS CERTIFICATES.

Pinkest. II. 1b.—A finely-formed, medium-sized flower and of good substance; the slightly quilled and pointed florets are of a deep mauve-pink colour. Shown by Mr. H. SHOESMITH, Junr.

Mrs. F. C. Maples. II. 1a.—A large and handsome Japanese variety of excellent exhibition style. The broad florets are rich golden-

yellow. Shown by Mr. E. H. PEARCE, Long Sutton Gardens, Basingstoke.

Cheerful. V. 2a.—This single, terra-cotta variety was raised by the late Mr. W. J. Godfrey. It is good in spray form, has a faint rosy sheen, and a narrow yellow zone round the disk. Shown by Messrs. CRAGG, HARRISON AND CRAGG.

Jim Stacey. II. 2a.—A large exhibition variety of incurving Japanese style. The florets are broad and of a clear yellow colour. Shown by Mr. H. J. JONES.

UNITED HORTICULTURAL AND PROVIDENT.

Mr. CHARLES H. CURTIS presided at the monthly meeting held at the R.H.S. Hall, on October 10. Six new members were elected, one member withdrew interest from his deposit account amounting to £3 7s. 0d., and two members withdrew sums from their deposit accounts amounting to £86 18s. 3d., while the sums of £10 19s. 2d. was passed for payment to the nominee of one deceased member, and £4 13s. 9d. paid out on account of a deceased, lapsed member.

Sick-pay for the month on the Ordinary side came to £106 8s. 2d., and on the State side to £96 11s. 8d.; Maternity claims totalled £9 10s. 6d. The sum of £49 5s. 6d. was granted to thirteen members for dental and optical treatment, and twenty other cases were considered.

Obituary.

Dr. Benjamin Daydon Jackson.—It was with very deep regret we received the news of the death of Dr. Benjamin Daydon Jackson. He was knocked down by a motor car at Buckingham Gate, on October 1, and died in Westminster Hospital on October 12. Dr. Daydon Jackson was Secretary of the Linnean Society from 1880 until 1902, when he became General Secretary, a position he occupied until 1926, when he retired from secretarial work and became Curator of the Linnean Collections at Burlington House. His knowledge of plant history was encyclopaedic, and his memory, right up to the time of his accident (in his eighty-second year), was so extraordinarily good as to be almost uncanny. In celebration of his eightieth birthday, and on the occasion of the anniversary meeting of the Linnean Society on May 26, 1926, the many admirers of Dr. Daydon Jackson presented him with his portrait, painted by Mr. Ernest Moore, and many eminent scientists paid high tribute to the splendid services he had rendered to botanical science. Although his fine services to the Linnean Society for so long a period will never be forgotten, it is probable that the greatest monument to Dr. Jackson's knowledge, skill and capacity for work is the *Index kewensis*. This work is of outstanding importance and usefulness to botanists in all parts of the world, to horticulturists and horticultural journalists. It was a huge undertaking and one on which Dr. Daydon Jackson was engaged for nearly fourteen years. He also wrote *Linnaeus, the Story of His Life*; *Notes on the Catalogue of the Linnean Herbarium*; *Catalogue of Linnean Specimens of Zoology*; *Guide to the Literature of Botany*; the extremely useful *Glossary of Botanic Terms*; and biographies of Gerard, Turner and Bentham. He edited several botanical works, and was the author of many other publications than those quoted, chiefly on botany and botanical history. He only missed one general meeting in the whole of his service with the Linnean Society. At the time of his death he had in hand a fourth edition of his *Glossary of Botanic Terms* and revised the proofs just before he died. He also had undertaken a dictionary of genera named after individuals which was not finished. Dr. Jackson's life was a very full one, but no matter how busy, or how great the task on which he was engaged, he remained one of the kindest and most accessible of men, and would take infinite pains to give the humblest Fellow all the information asked for. On the occasion of

the Linnean bicentenary celebrations in 1907, Dr. Jackson was created a Knight of the Swedish Order of the Polar Star, but although he received few honours from his own countrymen, he received what he prized highly—the affection and esteem of all who were acquainted with him and his work. An appreciation of Dr. Benjamin Daydon Jackson, and a reproduction of the presentation portrait, appeared in our issue of June 6, 1926.

ANSWERS TO CORRESPONDENTS.

AMARYLLIS, NERINE AND HIPPEASTRUM LEAVES.

—M. A. The "white fungoid growth" on the leaves sent is some extraneous inorganic substance, and is not due to any fungous attack. It is impossible to say what is the matter from the material sent.

ELEPHANT HAWKMOTH CATERPILLAR.—A. T. J.

The caterpillar reached us in a black and putrid condition; its size, however, and the short horn above its tail, showed that it was a larva of the Large Elephant Hawkmoth (*Eumorpha elpenor*), one of the handsomest of our native Hawkmoths, and by no means uncommon. The foodstuffs of the larva are (wild) Bedstraws, Willowherbs, Convolvulus, Wild Madder and Purple Loosestrife, etc., and (cultivated) Balsams, Vine, Virginian Creepers, Fuchsias, Enchanter's Nightshade, Lettuce, etc. It pupates in the earth in September or October, and the moth flies about the following Whitsuntide. The larvae are usually brown or green, marked with black and with two sham, black and white eyes near the head, which are most obvious when danger threatens. N.B.—Correspondents sending us caterpillars and other wingless insects for identification are particularly requested to send them alive in small tin boxes, with some fresh (but not wet) leaves or grass to act as loose packing and shock-absorbent to the specimens during transit. Unless the box is very small it should not be perforated but should always be wrapped in paper, preferably brown.

GRAPES DISCOLOURED.—M. S. The discoloration on the berries may be due to rubbing or rather heavy syringing while the Grapes were quite young. We could find no trace of disease.

LICENCE FOR A GARDENER.—A. W. A gardener comes within the definition of a "male servant" in the Act, and a licence is therefore required.

NAMES OF FRUITS.—G. H. E. Durondeau; 2, Le Lectier; 3, Beurré Hardy; 4, Conference. H. P. Black Norman.—*Lost one*. 1, Bramley's Seedling; 2, Newton Wonder; 3, White Westling; 4, Striped Beefing; 5, Malster.—G. B. G. 1, 4 and 7, numbers detached owing to bad packing; 2, Bramley's Seedling; 3, Golden Noble; 5, Mère de Ménage; 6, Dumelow's Seedling; 8, Adams's Pearmain; 9, Blenheim Pippin.—E. R. K. 1, Winter Strawberry; 2, Keswick Codlin; 3, Small's Admirable; 4, Worcester Pearmain; 5, small, not recognised; 6, White Nonpareil; 7, Green Balsam; 8, Hawthornden; Winter Greening; 10, Cellini; the red fruit is *Rubus illecebrosus*, popularly called the Strawberry-Raspberry.—A. M. Ribston Pippin.—J. B. 1, Ribston Pippin; 2, Worcester Pearmain; 3, not recognised.

SEEDLING APPLE.—H. A. S. S. The seedling Apple is quite a fair early cooking variety, but too soft to keep for any length of time. It is pleasantly acid in flavour, which, together with the shape of the fruit, suggests that Dumelow's Seedling (Wellington) was one of the parents. We do not think it is of any particular commercial value, but if it crops well it is worth retaining in the garden.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 45.5.

ACTUAL TEMPERATURE—

The Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, October 26, 10 a.m. Bar. 29.9°. Temp. 53°. Weather, Dull.

Strawberry Cultivation (II).

THE observations on the seasonal development of the root system and crown of the Strawberry make it all but certain that time of planting must have a marked effect on the first season's crop. Experiment confirms this deduction. Series of rooted runners (of Royal Sovereign) were planted out at monthly intervals from August 8 to October, and others were put in on December 18 and March 18. The August-planted runners altogether outstripped those planted at the later dates. Both the root and the crown development of the former surpassed altogether that achieved even by the runners planted a month later (September 8). The superiority was even more conspicuous when the plants came into flower, whereas those planted in the previous August bore each from eight to ten strong flower trusses, those planted in September had only two or three per plant. It follows therefore that Strawberry runners should be planted out in their permanent quarters as early as possible. Experiments were next made with the object of ascertaining the best method of planting. Some batches were planted shallowly with the base of

the crown resting on the soil. Others were planted more deeply so that the soil reached up to the leaf bases. Others again were planted deeper so that the crown was just covered, and another batch was treated in the Canadian method, that is, by shortening the runner roots, the crown being then planted at normal depth. Root shortening produced no ill effect. New roots were developed at the cut ends within six weeks of planting, and the new roots, running out in a horizontal direction, provided a good anchorage for the plant. Hence, in soils exposed a good deal to frost it might be worth while to adopt this system in order to reduce the lifting of the crowns out of the soil, which lifting happens after winter or spring frosts. As to depth of planting, the results showed that deep is better than shallow. Planting so deep that the crowns are covered may lead to a rotting of some crowns, but otherwise results in the production of good plants. Speaking generally, however, normal planting, that is, setting the crowns so that the soil reaches to the bases of the leaves, produces the best results. The surface-rooting habit of the Strawberry, to which reference was made in Part I* (see p. 319), must evidently be taken into account in the practice of cultivation. Hoeing has to be done, but even when done with the utmost care the effect is bound to be some root disturbance and particularly damage at the vital point, mainly where the root comes away from the crown. Therefore, since root development is active after cropping has concluded, hoeing should be done as early as possible, and soil should be drawn up to the crowns after a row of plants has been hoed. Another reason for hoeing the Strawberry plantation early is that the least permanent damage is done to the crop when the root disturbance and injury incidental to hoeing occur soon after cropping. An equal amount of damage done by hoeing in the spring has a far more serious effect on the plants. Whilst on the subject of cultivation it may be pointed out that the authors, Messrs. Ball, Mann and Staniland, have shown that Strawberry roots are very readily damaged by water-logging of the soil—a fact of which account should be taken in deciding how long a Strawberry plantation should be left before it is replaced by a fresh one. Lastly, it is to be borne in mind that where late planting cannot be avoided the plants, when they flower, should be deblossomed at an early stage. This practice leads to the production of strongly-bearing plants in the following year. So much for methods of cultivation; but what of the plant cultivated? Enquiry and observation have led Messrs. Ball, Mann and Staniland to recognise that wide differences exist between groups of plants belonging to one and the same variety. Some groups may be vigorous, others weak. In other words, it has to be recognised that a number of strains may and often do exist within one variety. The remedy is, of course, to be sought along the lines of elimination. Only strong and prolific plants should be used for propagation. Where this is done the parental vigour is, as the authors show, perpetuated in the runner plants. Another means of ensuring that plants raised from runners shall be vigorous is to restrict the number of runners on plants used for the purposes of propagation. When, say, the first three runners only are allowed to remain, the resulting plants are found to be more vigorous and prolific than when more runners are preserved and taken; needless

to say, the runners should be not only restricted in number, but should be taken from a vigorous "parent." As the authors point out, if the public insist on cheapness it cannot expect that runners should have been produced under a meticulous system of selection; but the instructed public will undoubtedly be prepared to pay a higher price for better plants, and we therefore hope that growers will take all the steps necessary to provide rogued and selected runners for those who are willing to pay a reasonable price in return for the extra labour involved. The subject of strain runs into that of disease. Of diseases of the Strawberry, several of serious nature are known. There is, for example, "Red Plant," a malady which is now wide-spread. The disease is easily recognised in spring by the malformation of leaves and weakness of blossom. Flower trusses may be of almost microscopic size and the leaf blades irregular and crumpled. Some varieties, Royal Sovereign for instance, show, moreover, an intense red coloration of the small and malformed leaves—others, like Sir J. Paxton, do not exhibit the discoloration. What may be an extreme form of Red Plant is known as Cauliflower disease—so named because the plant when in flower looks somewhat like a Cauliflower. There is evidence which is strong, albeit not conclusive, that Red Plant is due to the invasion of the Strawberry plant by the eelworm, *Aphelenchus fragariae*. Plants exhibiting the symptoms of these diseases should, of course, be discarded. Then there is the Strawberry aphid (*Capitophorus fragariae*) which lives all the year round on Strawberries, walks along the runners and infects the young plants. Where Strawberries are badly affected by this aphid the plant has a flat appearance, its leaves are crinkled and cupped, of yellowish colour, with yellow edge and short, fleshy leaf-stalks. The crowns of affected plants are more numerous than are those of healthy plants. Many of the most popular varieties are susceptible to aphid attack; for example, Madame Kooi, Laxtonian and Royal Sovereign. Rather less susceptible are Stirling Castle, Sir Joseph Paxton and President. A distinct resistance to aphid attack is exhibited by Bedford Champion, MacMahon and Ruskin, and a high degree by Marshal Foch, Sturton Cross, Lord Overton and Aberdeen Standard, whilst the French variety, Tardive de Leopold, appears to be immune. It must, however, be recognised that susceptibility is, as might be expected, largely a question of strain, for, evidently, a vigorous plant will tend to "grow away" from the attack of aphid. To make sure that runners are free from aphid, the authors recommend the use of a solution of nicotine, water and soap, made of nicotine (ninety-eight per cent.), half-an-ounce; water, ten gallons; soap, sufficient to produce a lather. Runners dipped in the solution will remain free from aphid until the following spring. If aphid is prevalent in a plantation steps must be taken to control it, for aphid-infected plants never become normal. A thorough spraying with the nicotine solution would appear to be the best method of aphid control. With the facts recounted above in mind, Strawberry growers should be able to solve successfully the problem how to recover the high yields of former days. Attention to cultivation—early planting in well-drained soil—careful hoeing, keeping the hoe away from the crown, slight earthing up after July hoeing, elimination of poor strains, limited propagation, and the banishment or destruction of aphid, would appear to be the means, combined, we may add,

* Journal of the Ministry of Agriculture, Vol. xxiv, 6, September, 1927. Published by H.M. Stationery Office, 6d. net, post free.

with the use of a suitable fertiliser which will produce this much desired end. It is not often that we have the pleasure of reading such a business-like and valuable contribution to horticultural science as that made by Messrs. Bell, Mann and Staniland, whom we thank on behalf of those who grow plants and who will, we are sure, profit greatly by putting their precepts into practice.

Gift of Glory Woods to Dorking.—Lord Francis Pelham Clinton Hope intends to present the Glory Woods to Dorking next April, to celebrate the coming-of-age of his son. Glory Woods, which lie to the south of Dorking and are ten acres in extent, have for some time been very popular with visitors. Lord Francis, who is brother and heir of the Duke of Newcastle, is reported to have said that "As long as I can remember, Glory Woods have been the playground of Dorking, and I have no wish that they should be anything else."

Allotment Holders and Playing Fields.—Following the annual Conference of the Allotments Organisation Society and Small Holders (Limited), at which the subject of playing fields was discussed, the Secretary has forwarded the following resolution to the National Playing Fields Association:—"This Conference desires to record its high appreciation of the splendid efforts of the National Playing Fields Association in providing open spaces so that children and the youth of the nation may derive the fullest benefits from fresh air and recreation, and calls upon the allotment movement to back up the efforts of that Association as, in the opinion of this Conference, the work of the one complements that of the other."

Gladioli at the Oyster Feast.—At this year's world-famed Colchester Oyster Feast (held on the 20th instant) there were several innovations, not the least interesting being the introduction of Gladioli for use in decorating the Mayor's Parlour and the Town Hall. The flowers were contributed by and accepted as a gift from the British Gladiolus Society, and included the leading British varieties.

Horticultural Club.—The Committee of the Horticultural Club has arranged a series of dinners and lectures for the session 1927-28. The first dinner will be held at the St. Ermin's Hotel, Westminster, on November 1, at 6.30 p.m. for 7 p.m., followed by a lecture by Mr. E. A. Bunyard on "Some Impressions of the Cape," illustrated by lantern slides. Notification of intention to be present should be sent to the Hon. Secretary, Mr. G. F. Tinley, 855, London Road, Westcliff-on-Sea, Essex.

Proposed Nature Reserve in Fenland.—The Council of the National Trust is appealing for a sum of £10,000 to enable it to purchase additions to and maintain Wicken Sedge Fen and Burwell Fen as a great natural reserve. The scheme has been under consideration for more than twenty-five years and is one that should appeal to all lovers of Nature. The property already acquired amounts to nearly one square mile, and the cutting of Sedge and litter brings in several hundred pounds a year, but the primary need now is for an endowment fund to enable the Trust to prevent undue overgrowth of certain native trees and shrubs, keep the water-ways clear, and preserve the rare plants and insects that abound in Fenland. The situation of these fens render them entirely suitable for a nature reserve. It is not so remote as to be inaccessible to nature lovers, yet sufficiently so to discourage undesirable visitors. It is largely protected by the broad waterways, the dikes and lodes of the Fenland, and is an ideal home for the fauna and flora of a wild, marsh country. In Wicken Fen (and St. Edmund's Fen), the Trust now owns 333 acres, but there remain 110 acres which it would be most desirable to acquire. In Burwell Fen the Trust owns 287 acres, but there are 230 additional acres of wild land, suitable and suitably situated, which the Council hopes

to be able to obtain so as to ensure conditions which will perpetuate the ancient plant and animal life in Fenland on the lines that have been so admirably followed of late in Australia. A gift of £20 carries with it Life Membership of the Trust, while one of £100 entitles the donor to Honorary Membership. Donations in response to this appeal should be forwarded to the Secretary, The National Trust, 7, Buckingham Palace Gardens, S.W.1.

Royal Gardeners' Orphan Fund.—When the Lady Elinor Denison opened her gardens at Ossington Hall, Newark-on-Trent, Nottingham, to the public, rain fell so heavily that few people were able to take advantage of the privilege, consequently the collection made on behalf of the Royal Gardeners' Orphan Fund amounted to only 15s. This sum we have received from Mr. Albert O. Marshall, who, however, is shortly leaving Ossington Hall to take charge of the gardens at Bere Court, Pangbourne.

Mr. Alfred Watkins, V.M.H.—It is with great pleasure we reproduce the portrait of Mr. Alfred Watkins, V.M.H., founder of the wholesale

MR. ALFRED WATKINS, V.M.H.

seed firm of Messrs. Watkins and Simpson. He has always been a liberal supporter of the National Sweet Pea Society, and before that Society came into being he took part in the celebration of the Bicentenary of the Introduction of the Sweet Pea into England. Mr. Watkins conducted the National Sweet-Pea Society's novelty trials at his firm's trial grounds at Twickenham, in 1926, and generously entertained the members when they visited the trials. In these and other ways he has "done good work on behalf of Sweet Peas," therefore the recent award of the Gold Henry Eckford Memorial Medal to Mr. Watkins was as well merited as it was popular.

White Hill, Surrey.—The beautiful elevation in the parishes of Caterham and Bletchingley known as White Hill, was dedicated to the public on Saturday last. The land was purchased by Sir Benjamin Brodie and Mr. Harry Lloyd and presented by them as an open space for the use of the public for ever, and the title deeds have been handed to Mr. H. F. Mitchell, Chairman of the Caterham Urban Council. White Hill is about eight hundred feet above sea-level, and commands magnificent views over Surrey, Sussex and Kent.

Langdon Hills.—Efforts are being made to preserve Langdon Hills, a beautiful spot about midway between London and Southend. These Hills, already well-known to many Londoners, rise to a height of four hundred feet above sea-level and command fine views

over the estuary of the Thames, Chelmsford, Brentwood and the Kentish Hills, and on fine, clear days, even St. Pauls and the Crystal Palace may be seen. About forty acres of the highest land is now offered for sale, and unless this area can be purchased for the public it is almost certain to be built over. The sum needed to preserve Langdon Hills is £4,000, and donations towards this amount should be sent to the Manager, Barclay's Bank, Laindon, Essex.

Horticultural Exhibitions in Germany.—An exhibition of flowers and fruits took place at Frankfurt during September, opened by the Oberbürgermeister, Dr. Landmann. The fruits shown, which came from all parts of Germany, demonstrated clearly that fruits of the best quality can be grown in the Reich; the sorting and packing also left little to be desired. There were likewise fine exhibits from Holland and from Italy, some Tyrolean Apples especially calling for high praise. In the flower section the firm of Pfitzer, Stuttgart, had a good group of Gladioli, and there were a number of Dahlia exhibits. From the 17th to the 19th September, an exhibition was held in Hanover, in which several complete gardens were shown, and aroused great interest among the visitors.

Mr. Kingdon Ward's Tenth Expedition in Asia.—On Monday, October 31, Mr. F. Kingdon Ward leaves London for his tenth plant-hunting expedition in Asia. He will commence with an Orchid collecting trip in the Naga Hills, and for this part of the expedition he will be joined at Marseilles by Mr. Sydhm Cutting, of New York. At the conclusion of the Assam tour, Mr. Kingdon Ward will be joined by Mr. Hugh Clutterbuck, and will proceed to the Lohit Valley, where he proposes to explore to the north and west, in the Mishmi Hills, for new Rhododendrons and other trees and shrubs, hardy herbaceous and alpine plants. The entire expedition is expected to conclude in November, 1928, but if circumstances warrant, it may be extended beyond that period. Mr. Kingdon Ward will tell the story of his travels, as usual, in the pages of *The Gardeners' Chronicle*.

The late Dr. B. Daydon Jackson.—The funeral of the late Dr. B. Daydon Jackson, for forty-seven years Secretary of the Linnean Society, took place at Golders Green on Monday, October 17. In addition to members of the family, those present included Dr. A. B. Rendle (President), Lt.-Col. A. T. Gage (Secretary), Dr. W. T. Calman (Zoological Secretary), Mr. J. Ramsbottom (Botanical Secretary), Mr. S. Savage and Mr. W. S. Warton, from the Linnean Society; Dr. Otto Stapf, Editor of the *Botanical Magazine*; Sir David Prain, representing the Royal Society; Dr. A. W. Hill (Director), and Mr. A. D. Cotton (Keeper of the Herbarium) from Kew; Professor F. W. Oliver, representing the Botanical Department of the University College, London; Lt.-Col. Durham (Secretary) and Mr. F. J. Chittenden (Director of the Wisley Gardens), from the Royal Horticultural Society; Dr. G. M. Vevers, from the Zoological Society; Professor R. Gates, from the Botanical Department, Kings College; Mr. B. F. Barnes, from the Botanical Department of the Birkbeck Institute; Mr. de Post, representing the Swedish Ministry; Sir Arthur S. Woodward, Mr. Percy Thompson, Professor F. Fritch, and Mr. E. Moore, with representatives of other learned bodies and many life-long friends.

Presentation to Lord and Lady Aberdeen.—A special meeting of the members of the Deeside (Aberdeen) Field Club was held in the Town and County Hall, Municipal Buildings, Aberdeen, on Saturday, the 15th inst., to do honour to the Marquis and Marchioness of Aberdeen and Temair on the attainment of their fiftieth year of married life. There was a large and representative assemblage, and Mr. Charles Davidson presided. He opened the proceedings by paying a warm tribute to Lord and Lady Aberdeen for all they had done for the Deeside Field Club. Admiral Sir Arthur M. Farquhar

said Lord and Lady Aberdeen had only to look round that great gathering to see how very much their services were appreciated by the Club. The Deeside Field Club was enormously indebted to them. He wished them everything that was good for the future, and congratulated them upon their golden wedding. Mrs. J. S. Davidson, Cairnlee, then handed a silver-gilt fruit dish to Lord Aberdeen as a token of regard and appreciation of the many valuable services he and Lady Aberdeen had rendered to the Club. The following inscription was on the fruit dish: "A golden wedding gift to the Marquis and Marchioness of Aberdeen and Temair from the Deeside Field Club. November 7, 1927." Lord Aberdeen, replying, said the gift was a beautiful token of a beautiful thought. It was a lasting token, to be for ever valued not only by Lady Aberdeen and himself, but by their descendants. They looked forward to the celebration of their golden wedding all the more because of the extraordinary manifestations it had evoked, and none more so than the comprehensiveness of the thought, kindness and affection of the Deeside Club. Lady Aberdeen, in her reply, reminded the hearers that the main link of union between them was a common love of Deeside. The very name had in it something intimate, caressing, fascinating, which lured them on to want to know as much as possible about the history and treasures of Deeside, and the reason of the peculiar and wonderful charm of that district of Scotia to which they were proud to belong. And now they were given that beautiful token, which in itself seemed to possess the associations which would bring back the memory of all those meetings when they had worked, played and travelled together. They accepted it as a token of the truest friendship and a pledge of still closer relationship in the future. Tea was served and a musical programme contributed during the afternoon, and amid manifestations of the warmest affection and regard for Lord and Lady Aberdeen one of the most delightful and harmonious meetings ever held under the auspices of the Club was brought to a close by a vote of thanks to the Chairman.

Appointments for the Ensuing Week.—

TUESDAY, NOVEMBER 1: Royal Horticultural Society's Committees meet; Brighton, Hove and Sussex Horticultural Society's show (three days); West of England Chrysanthemum Society's show (three days); Bolton Horticultural Society's lecture; Royal Caledonian Horticultural Society's meeting. WEDNESDAY, NOVEMBER 2: Weymouth Chrysanthemum Society's show (two days); Croydon Chrysanthemum Society's show; Faversham and District Chrysanthemum Association's show (two days); Forest Hill Chrysanthemum Society's show; Guildford Chrysanthemum Society's show (two days); Taunton Chrysanthemum Society's show (two days); Bideford and District Horticultural Society's show; Nottingham and Notts. Chrysanthemum Society's meeting; London Gardens Guild lecture. THURSDAY, NOVEMBER 3: National Chrysanthemum Society's show (two days); Henfield Chrysanthemum Society's show; Winchester Horticultural Society's show (two days); Linnean Society's meeting. FRIDAY, NOVEMBER 4: Chorley and District Chrysanthemum Society's show; Manchester and North of England Orchid Society's meeting; Dundee Horticultural Society's lecture. SATURDAY, NOVEMBER 5: Accrington and District Chrysanthemum Society's show; Blackburn and District Horticultural Society's meeting.

"Gardeners' Chronicle" Seventy-five Years Ago.—Can Hollyhocks be Grown in Pots?—

At the present time, when I think it is becoming yearly more manifest that florists' flowers, to maintain their hold on public estimation, must be shown in the shape of plants as well as in a cut state, the question which heads this article naturally presents itself. Of course, the lag-behinds and stationary folks have already given their verdict: "Impossible," "Nonsense," and so forth; but men of progress may be inclined to try, and trying, are sure to succeed; for though red spider, thrips, mildew and other ills which plants are heir to, may present themselves, all that we can say is, we have

beaten them before, and we will conquer again. Although the Hollyhock is a gross feeder, and requires considerable root-room, it is perhaps not more gross than some other plants which are grown for exhibition purposes, as for illustration, *Clerodendrons*; and if we observe the same rule with the Hollyhock, and give it rich compost and manure-water; in fact, if instead of allowing a cubic yard of soil we concentrate the nutriment of that mass in a ninth part of its compass, I have no doubt that the Hollyhock may be grown to great perfection; yes, to greater perfection than when unrestricted in the open ground, inasmuch as undue grossness may be controlled, and so equalised, that instead of having a few flowers at the apex, the plant

form a group scarcely less remarkable and gorgeous than a bank of Azaleas in May. But it is not so much as objects of interest at exhibitions as for general gardening purposes that I would advocate the growth of Hollyhocks in pots; for, nicely managed, the purposes to which they might be applied in a decorative point of view are almost endless. Grouped together in well contrasted masses upon lawns, the pots plunged in the grass, or even as single specimens, mixed with gardenesque examples of shrubs or dwarf trees—arranged in lines along straight walks, or upon terraces, placed in niches, or indeed arranged anywhere where a very conspicuous object is required; they would be found exceedingly effective and alike

FIG. 152.—LAELIO-CATTLEYA MRS. MEDO, THE NODE VAR.

R.H.S. Award of Merit, October 18. Shown by Mrs. Carl Holmes (gr. Mr. Penton), The Node, Welwyn. Flowers bronzy-yellow, ruby and purplish-mauve. (see p. 334).

may be proportioned to the flowers, and the flowers to the plant; that is, a well-grown and properly bloomed plant may be produced; of course, for exhibition purposes, a proportionate and regularly bloomed plant would be preferable to a large one with a few remarkably fine flowers, and yet the bloom-buds might be so thinned out and protected as to bring them to great perfection, both in size, colour and quantity. I have had some plants in the open ground scarcely more than four feet in height and beautifully branched, which I consider would be splendid pot subjects; and a dozen or score of them, nicely bloomed and contrasted, would

useful for the decoration of the cottage ornée, or one of the palatial houses of England. We have no plant so effective as a single specimen, or which in its symmetrical proportions accords so well with straight lines and architectural proportions of a first-rate residence, as the plant under notice. Again, the season of the Hollyhock may be much extended; for, by bringing the first lot in pots forward in a warm situation, and retarding a late lot in a north aspect, we might have plants in perfection from June until October. In fact, in no point of view could the Hollyhock be out of place. W. P. Ayres, *Blackheath. Gard. Chron., October 30, 1852.*

The Week's Work.

THE ORCHID HOUSES.

By J. T. BARKER, Dunstable, Bedfordshire.

Vandas.—Plants of the tall-growing *Vanda tricolor* and *V. suavis* are developing new roots, and should either be repotted or afforded fresh surfacing material. Specimens with healthy roots but which have lost their bottom leaves, should have the lower part of the leafless stem cut away in order to bring the bottom leaves slightly above the rim of the pot. Fill two-thirds of the pot with crocks and finish off with new potting material in the usual manner. Well-rooted plants that have retained their foliage and are growing in pots too small to carry them through another season, should be placed in receptacles of a suitable size. Provide receptacles that will accommodate the roots comfortably. Place the lower roots in position and fill in with clean crocks, and over this place a layer of Sphagnum-moss; next, place the compost, which should consist of *Osmunda* fibre cut up moderately fine, and live Sphagnum-moss in equal parts, arranging it so that the material makes a slight mound from the rim of the pot to the stem of the plant. Aerial roots of sufficient length should be worked down into the material when potting, and the new ones, as they attain sufficient length, should be pegged down to the surface and receive every inducement to enter the material. After repotting, water will not be necessary for a few days, and afterwards only just sufficient to keep the Sphagnum alive. These *Vandas* delight in fresh air, and will grow well in a house having a warm intermediate temperature. A small, brown scale insect sometimes infests the leaves, and care is necessary in its removal, as the leaves are easily damaged and the plants disfigured.

V. Amesiana, V. Kimballiana and V. Watsonii.—These three *Vandas* are the most charming plants in this family and produce their flowers at a most acceptable season. The flower spikes are now well advanced, and before the blooms commence to open the plants should be placed in slightly warmer and drier conditions where the flowers will develop better and not be so likely to become spotted as in a cool, moist atmosphere. When the flowering season is over the fleshy roots need less water. During the winter the plants may be rested in a cool intermediate house, where very little water at the roots will be necessary, as the terete foliage is capable of withstanding considerable drought without harm.

THE KITCHEN GARDEN.

By R. H. CROCKFORD, Gardener to THE RT. HON. LORD WAVERTREE, Horsley Hall, Gresford, N. Wales.

Sage and Thyme.—Portions of either of these herbs, pulled off with a heel and dibbled very firmly in a bed of good sandy soil, will root readily during mild, open weather, and will then be in readiness for planting into beds later on.

Mint.—A supply of roots should now be lifted and placed in boxes in readiness for gentle forcing, as desired.

Spring Cabbage.—Round about this time plants required to constitute the main crop of this vegetable should be planted. It is not too late to make another planting in the course of the next few weeks for the latest supply.

Cardoons.—Where the stems of this vegetable are sufficiently blanched they should be carefully lifted and used as required. The tops may be protected during frosty weather by the method advised for Celery.

Lettuces.—Plants raised from seeds sown during early September, for the purpose of withstanding the winter, should be lightly thinned, as probably some may damp off during the season. The thinnings may be planted rather closely together in rows made about one foot apart. Winter lettuces should be grown either

on a warm border or in a position sheltered from cold winds. Keep the young plants dusted with soot, which will preserve them from slugs. Should sparrows prove troublesome, stretch strands of black cotton or thread alongside the rows.

Spinach.—Where sowings of Spinach seeds were made, as advised, thin the seedlings to about six inches apart. The bed should afterwards be hoed on all favourable occasions.

Winter Spinach.—The Dutch hoe should be used between the rows of this crop so as to assist the development of the succulent leaves. Where pigeons or larks are troublesome, a dusting with old soot will generally ward off attacks.

Asparagus.—Asparagus stems should be cut down to within three inches of the base and the beds carefully weeded. A dressing of soot may then be given and lightly forked in, following this with a good dressing of well-rotted manure spread over the whole surface. Finally, place the garden line alongside the beds and lightly edge them with the spade, spreading the loose soil, shovelled from the alleys, over the manure, thus leaving the beds in a neat condition for the winter. The alleys between the beds ought to be lightly forked over, especially if the soil is heavy. Should there be any bare spaces in the beds, these sites should be marked with a stick and prepared for the reception of strong plants next April.

HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD, Wrotham Park, Barnet, Middlesex.

Fruit Gathering.—The gathering and storing of both Apples and Pears will need daily attention until the whole of the crops have been harvested. Late varieties should be gathered last as they keep much sounder when they are well matured, and sometimes a few clear bright sunny days late in the season greatly aid the ripening and flavour of the fruits of the best of our late keepers. Bramley's Seedling, Chelmsford Wonder, Lane's Prince Albert, Newton Wonder and Alfriston are very dependable for late use. Too much care cannot be taken in handling the fruits when placing them in baskets. I prefer to use trug baskets of medium size when gathering fruits. All fruits should be gathered when perfectly dry, graded and placed on clean boards or racks in a sweet, well-ventilated fruit room. Keep the different late-keeping varieties apart from the earlier sorts so that the latter may be used in order of ripening. Where there are large quantities of fruits they may be placed several layers thick, if perfectly sound. Keep the atmosphere of the fruit room sweet at all times and do not place the fruits on hay or anything that would impart a flavour to them.

Pears.—By this date most of the Pears will have been gathered, and they keep their flavour best when stored in a temperature a trifle higher than is generally allowed for Apples; even late varieties ripen much better and their flavour is much improved when stored in a moderately warm place. Our best late varieties, and those we depend upon most, are Josephine de Malines, Glou Morceau, Nouvelle Fulvie, Le Lectier, Beurré Perran and Blickling.

Plum Coe's Golden Drop.—This very excellent variety usually crops heavily, but unless the fruits are thinned freely their flavour is poor. Most, if not all, the fruits will have been gathered by now, but any still hanging on the trees should be removed carefully when perfectly dry, and placed in a dry cool place. If each fruit is laid out separately on tissue paper it will keep good for several days and improve in flavour.

Winter Moth.—In some seasons this pest is very destructive to the Apple crop, and in order to check their ravages grease-banding should be attended to without delay, otherwise it will be of little use this season.

PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NALL-CAIN, Broomfield Hall, Hertfordshire.

Shrubs for Forcing.—Flowering shrubs are useful subjects for producing blooms during the early spring. They may be used either for cut flower purposes or for bold grouping in the conservatory, and for this latter purpose there is nothing so inexpensive. Lilac, *Prunus*, *Viburnum*, *Wistaria*, *Spiraea*, *Laburnum* and other kinds are all valuable and where a stock has been grown previously the pots should be examined with regard to drainage, the roots top-dressed with new soil and, if it is required to supplement their number, plants should be ordered forthwith.

Azaleas.—Azaleas are very useful plants, and few can surpass them for conservatory use during the winter and spring months. Large numbers of Azaleas are imported annually, both of indica and mollis varieties. Azaleas are very fine-rooting subjects, and when imported they should be placed in small pots. A suitable compost consists of peat and silver sand, which should be made firm by ramming; when potted they should be stood in a cool house or frame where frost is excluded, and sprayed occasionally. They must never suffer from lack of moisture at the roots, or the leaves will soon drop and the buds fail to open freely. After a few weeks of this treatment they may be taken into warmer quarters in sufficient numbers to meet the demand, and gradually forced.

Spiraeas.—These are valuable for producing flowers in early spring, and many herbaceous kinds are now available in quantity; these should be secured and potted up at once. Good sorts include *S. Peach Blossom*, *S. japonica*, *S. palmata* and *S. Queen Alexandra*. *Spiraeas* delight in a somewhat heavy compost, and the potting compost should be made firm about their roots. When growing freely *Spiraeas* need a considerable amount of water at the roots and must never be allowed to become dry; when the flower spikes are advancing it may be found necessary to water them twice daily on bright days.

FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P., Ford Manor, Lingfield, Surrey.

Pot Strawberries.—The most important work amongst pot Strawberries will be storing the plants for the winter. Crowns have not ripened well and a number of growers will feel inclined to delay the operation of plunging if fine, autumn weather continues. The work must, however, be got through, and provided they are plunged in the open the plants will still have full exposure. If the natural soil is used as a plunging medium it should be limed or watered with lime-water and soot to destroy worms, which would otherwise do much mischief. Piling the pots on their sides is a method that cannot be recommended; pot Strawberries, like pot Peaches, should never lack water, hence the obvious danger of laying them on their sides.

Pot Vines.—These are not grown so much as they deserve to be, but the majority of growers who are obliged to cut Grapes early in May still grow a few annually, and this allows an extension of resting period for the permanent house. The successful forcing of pot vines depends more upon the preparation of the vines than upon the detailed operations of forcing; strong canes frequently fail while thoroughly ripened and weaker canes give plenty of bunches. Ripeness is the great desideratum, and canes should be chosen that are hard, brown and well-rooted, which have had a good rest and may be started with every chance of success. The house or pit should not be too large; a span-roof admits most light but requires more fire-heat than a lean-to. If the vines were shortened back to their proper length a few weeks ago there will be little danger of bleeding. When properly arranged, carefully rammed and lightly top-dressed, a quantity of fermenting leaves,

mixed with a little horse manure, may be introduced, but these fermenting materials must be renovated when necessary, as the warmth and moisture from these will permit of economy in fire-heat, and render direct syringing almost unnecessary; provided the buds break evenly and well the less the canes are syringed the better.

THE FLOWER GARDEN.

By JOHN COUTTS, Assistant Curator, Royal Botanic Gardens, Kew.

Oncocylus and Regelia Irises.—The hybrids generally known as Regelio-cylus Irises are admittedly difficult to manage, but they are so beautiful that they are well worth some trouble. The species are represented by such choice and beautiful plants as *Iris iberica*, *I. Gatesii*, *I. atrofusca*, *I. Susiana*, *I. Korolkowii* and *I. Lortetii*. *I. Susiana* and *I. iberica* may be regarded as the most easily managed, and strong roots may generally be depended on to provide a good display, even in beds in the open. Generally, however, they should be planted on a warm, south border. A narrow border in front of a plant house is a very suitable position; shallow planting is essential, the rhizomes being covered with just sufficient soil to hold them in position. In the following season, when they have finished their growth, they may be either lifted and kept dry, or they may be covered with glass lights to keep them dry, but in any case a thorough ripening is necessary, and there is very little doubt that it is lack of sunshine to ripen the rhizomes that leads to so many failures with these Irises. If the species prove difficult and unsatisfactory there is some comfort in the fact that the hybrids are, perhaps, just as beautiful and certainly much more amenable to cultivation; all of them succeed on a warm, sunny border. A few good varieties are Charon, Eurydice, Flora, Hera, Hecate, Irene, Iris, Jocaste, Mars and Persophone.

Cimicifuga simplex.—In early October, this beautiful, hardy, herbaceous plant was making a fine display. Such a beautiful and graceful plant deserves to be more generally grown. It enjoys a cool, moist root-run and partial shade during the hottest part of the day. Planted alone in a bed or associated with late-flowering *Kniphofias*, it is excellent, while it is also well suited for planting on the margin of a lake or bog garden.

Deciduous Trees and Shrubs.—The transplanting of deciduous trees and shrubs may be commenced so soon as possible after they have shed their leaves, and it is an advantage to get transplanting done while the soil is in good working condition and still fairly warm. Most deciduous plants may be successfully moved without any soil attached to their roots, but care should be taken to preserve all the fibrous roots possible. When moved in this condition they should be very firmly planted. This may, in the case of smaller plants, be effected by treading, but in the case of large specimens it may be necessary to use a stout wooden rammer. It may also be necessary to water the plants, especially if the soil is at all dry. The first essential in successful transplanting is firm planting. Care must also be taken not to plant woody subjects too deeply, for many plants are killed slowly by deep planting. Deep planting is an unsuspected, but common, cause of *Azaleas* and *Rhododendrons* doing badly, and ultimately dying. Some plants, such as small trees, may require supports until they are established; this is best afforded by means of three guy ropes of soft gaskin—a much better method than that of using stakes and wires; although stakes may be sometimes necessary in exposed situations, they are not required after the first season. Large and valuable specimens are best prepared for transplanting by digging a trench round them the previous season and filling it in with good soil to encourage plenty of fibrous roots. To move large specimens with a ball of soil intact it is necessary to have a transplanting machine of some sort.

FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF AILSA, Culzean Castle, Maybole, Ayrshire.

Preparation for Planting.—As the thorough preparation of the soil is one of the most important items, whether for Roses, fruit trees or bush fruits, this work should now be taken in hand and the necessary cultivation given, so that the soil may have time to settle down before the actual planting begins. Where the planting of new Rose beds or borders is contemplated the soil should be deeply trenched and heavily manured, keeping the fresh manure at least clear of the surface area to be occupied by the roots of the new plants. Many deciduous trees and shrubs may also be planted now, and where sites have been chosen, these may also be prepared in advance by breaking up the soil

If once transplanted from their seed-bed as advised, the plants will now lift with fairly good balls of soil and roots and soon become established in their new quarters. This interesting phase of gardening has much to recommend it, as these plants, flowering in the early spring months, have a charm and freshness all their own, and many beautiful effects are obtained by judicious interplanting and blending of colours to suit individual tastes.

Under Glass.—*Coleus thyrsoides* is now growing freely, and careful watering and feeding is required to keep the foliage in a healthy condition; this plant soon shows distress, the lower leaves turning yellow and dropping, leaving bare, unsightly stems. Plants in six-inch pots should be top-dressed, using any well-compounded fertiliser mixed with twice

FIG. 153.—CHRYSANTHEMUM PINKEST.

N.C.S. First-Class Certificate, October 17; R.H.S. Award of Merit, October 18. Flowers mauve-pink. Shown by Mr. H. Shoesmith, jun. (see pp. 334, 336).

and subsoil as deeply as possible. Where a clay subsoil is encountered this should be removed, and its place taken by good soil; where practicable, some means of draining superfluous moisture from these holes should be devised, as otherwise they may hold water for a long time, and during wet weather the roots of the newly planted subjects remain in a constant state of stagnation. A quantity of chopped-up loam, leaf-soil and sand should be in readiness, and a little of this placed about the roots of the rarer and finer subjects to encourage the formation of those fibrous roots upon which so much of their future success depends.

Spring Bedding.—So soon as the summer occupants are over they should be removed, and the soil prepared for the reception of the spring-flowering subjects. Bulbs should be planted without further delay, and all carpeting plants, Wallflowers, etc., should be put out while the ground is still comparatively warm.

its bulk of soil. The plants should be kept from now onwards in a light position, and a night temperature of 60° will keep them growing steadily. Begonias of the Gloire de Lorraine type should now be allowed to flower, and if kept in a similar temperature to the above will soon develop plenty of blooms. These plants should also be regularly supplied with weak liquid manure and given an occasional watering with soot-water to keep the foliage in good condition. *Salvia splendens* is again putting forth its bright scarlet flowers, and as this is also a hungry plant its wants must be attended to. *Isoloma hirsutum* is also showing its deep crimson buds, which, later, will open, disclosing the bright-red tubular flowers. *Cypripedium insigne* has flowered earlier than usual this season, for some unknown reason, and it will be interesting to know whether this is the case with other growers; our batch of about sixty plants has been in full flower since early October.

ORCHID NOTES AND GLEANINGS.

CATTLEYA DOWIANA.

THIS superb *Cattleya* of the *labiata* group was discovered by Warscewicz in Costa Rica about 1850, but the plants sent by the collector to Messrs. Low and Co., of Clapton, arrived in bad condition and eventually died, so that it was not until the autumn of 1865 that *C. Dowiana* flowered for the first time in this country, in the Chelsea nursery of Messrs. J. Veitch and Sons, the re-discovery of the plant being credited to a Mr. Arce, a native naturalist, who was collecting in Costa Rica for Mr. G. Ure Skinner. The importation was sent to Mr. Skinner through Captain Dow, and to this last-named gentleman this superb *Cattleya* was dedicated.

Long ago it was recommended that *C. Dowiana* should be grown in baskets or pans and suspended from the roof at the warmer end of the *Cattleya* house, and this still remains a most satisfactory cultural method.

The variety *aurea* is more free-flowering than *C. Dowiana*; it was discovered by Gustav Wallis in 1868 in the State of Antioquia, while collecting in Columbia for M. Linden and, strange to say, in a locality quite six hundred miles distant from the home of *C. Dowiana*, in Costa Rica.

It is scarcely necessary to append descriptions of Orchids so well known; suffice it to say that the nankeen-yellow sepals and petals and the purplish-crimson, gold-reticulated lip of *C. Dowiana* combine to form such an exquisite piece of colouring as is scarcely equalled even amongst other Orchids; the variety *aurea* differs in the more copious and irregularly distributed golden markings of the labellum.

The influence of these superb autumn-blooming *Cattleyas* is evident in a host of beautiful hybrids. The well-known and beautiful *C. Hardyana* is a natural hybrid between *C. Dowiana aurea* and *C. Warscewiczii (gigas)*, and is reported to have been imported with the latter. This fine plant first appeared in the collection of Mr. G. Hardy, of Timperly, after whom it was named.

One of the earliest artificially-raised hybrids was *C. Chamberlainiana (C. guttata Leopoldii × C. Dowiana)*, raised by Seden for Messrs. J. Veitch and Sons, and dedicated to the late Rt. Hon. Joseph Chamberlain. R. A.

INDOOR PLANTS.

CYTISUS FRAGRANS.

CYTISUS fragrans (syn. *racemosus*) is a useful greenhouse shrub of bushy habit, with dense racemes of yellow flowers, and one of the easiest shrubby plants to force into flower. When growing in small pots the plants require careful attention as to watering. Shapely specimens are obtained by moderate pruning directly after the flowering period. *C. fragrans* will grow freely in a cool greenhouse, and may be placed outside in a sheltered position during the summer. Plants in five-inch pots are generally the most serviceable. Loam and well-rotted manure with a small quantity of grit, make up a suitable compost for them. Cuttings are made from the young shoots taken with a heel and inserted in sandy soil and placed under a bell-glass, or handlight, shade being provided until they are rooted.

Cytisus fragrans elegans has larger racemes than the type; good plants of this variety are obtained by grafting on the type.

Although not often seen growing out-of-doors, these *Cytisuses* are hardy in favoured localities, and I have recently seen two large bushes (in a town garden in east Kent) from five to six feet in height and loaded with bloom; their fragrance attracted my attention. These specimens had evidently been in their present position for some years. C. Ruse.

SOLANUM AVICULARE.

A LARGE number of species of *Solanum* have been introduced to this country at one time or another, though only a few find favour at

the present time, including *S. Ca sicastrum*, *S. jasminoides* and *S. crispum*. I had one to name recently from Woburn, Bedfordshire, and this turned out to be *S. aviculare*, the Bird *Solanum*, or Kangaroo Apple. It is a native of Australia, Tasmania and New Zealand, and was originally introduced to this country in 1772. It is figured in the *Botanical Magazine*, t. 349, under the name of *S. laciniatum*. Most of the leaves are lanceolate and entire on old plants, but on younger and more vigorous specimens they are often pinnatifid, as in some other species, including *S. Dulcamara*. The flowers are violet, with a shortly and bluntly-lobed corolla, the segments being bifid and crenate. The filaments and style are pale blue, and the golden yellow anthers very prominent. The berries are about the size of those of *S. Capsicastrum*, but are oval and longer. At first they are green but become soft and pale yellow. It is considered a greenhouse plant, and makes a bush five to six feet high in time. It had been planted out at Woburn, where it was flowering and fruiting. Evidently this and *S. nigrum* are the only species native to New Zealand, though three others have become more or less naturalised. The early colonists made the fruits into jam. J. F.

ALPINE GARDEN.

ASTILBE SIMPLICIFOLIA.

A DELIGHTFUL little plant from Japan, *Astilbe simplicifolia* is so diminutive that those who are only acquainted with the taller *Astilbes* can hardly credit that it belongs to the same genus, say, as *A. rivularis*, *A. Davidii* and the now numerous hybrids of the race. Yet it is a true *Astilbe* and one of the few suited for the smallest of rock gardens or the mere rockery of the amateur with a small garden. Mr. Farrer called it "a gift of the gods," and truly it is a charming little plant, with beautiful, shield-shaped, crimped leaves, above which are reared the plummy spires of elegant white flowers, forming, altogether, an almost fairy-like plant. It is a most exquisite thing for a cool and moist place in the rock garden, where it is sheltered. It has one failing in some places—its life is too short, this being attributed to over-floriferousness by some, but, by others, to the inclemency of our climate. All I venture at present to state is that it seems to be even longer-lived in northern than in southern gardens. It may be increased by seeds or division, and likes a moderately light loam.

In combination with other species, *A. simplicifolia* has given rise to some hybrids with rose, red, or lilac flowers, but these are taller and more vigorous in every way. Excellent though these are, they fall short in refinement when compared with *A. simplicifolia* itself, though they are said to be less liable to early demise than the charming plant which is the subject of this note. I am growing *A. simplicifolia* at the base of rock-work, in a cool, moist, partially-shaded position.

WALDSTEINIA TRIFOLIATA.

AMONG the species of *Waldsteinia* I should be disposed to place the above-named first on the list. It has larger flowers than the others in cultivation, and, although of a rather trailing habit, has not the troublesome ways of *W. fragarioides*. It has much more effect than the others, and it constitutes a charming carpet for early bulbous flowers. I have had it in bloom with the *Muscari*, or Grape *Hyacinths*, and with the lovely *Narcissus pallidus praecox*, and *W. trifoliata* formed a most delightful carpet for these, the combination of the bright yellow flowers of the *Waldsteinia* with the pale yellow of the Daffodil and the blue of the Grape *Hyacinths* giving great pleasure.

W. trifoliata has shining, trifoliate leaves and flowers, almost like those borne by the Indian Strawberry. It is remarkably easy to grow, and I have had it in both sun and shade, heavy and light soil, and in no case has it been shy to flower, and has covered the ground pleasingly.

It may be grown as a carpet plant or by itself in the rock garden or front of the border; while

it is also excellent for the crevices of paths or steps. *W. trifoliata* comes into bloom in early spring, and lasts in flower for months. It is absolutely hardy and plants may be raised from seeds, while little pieces already rooted may be taken from established plants. Cuttings are easily rooted under a handlight or other glass shelter but should be kept close for a few days.

POLYGONUM VIVIPARUM.

AWAY up on the alpine lawns there may be seen in some districts the singular Knotweed called *Polygonum viviparum*. It is singular in the respect that, unlike most hardy flowers, it produces young plants in the axils of the leaves. There are, of course, others which do this, but not many, and the possession of this feature causes the plant to be of much more interest. But it is quite pretty in its way and is a nice feature on the front of the border or the rockery. It has neat leaves and stems carrying white flowers. These open in June. This Knotweed is seldom on the market, and it was with pleasure that I observed it offered this year. I have known it for upwards of forty years, and I was much interested in seeing it in a very old garden where *P. viviparum* had been grown in the borders for several generations. It is quite easy to cultivate in ordinary loam, and may be increased by removing the small, young plants, or pegging down the stems until the plantlets root. It likes the sun, but will grow in partial shade. S. Arnott.

GENTIANA FARRERI.

THAT this very beautiful *Gentian* is not so easily grown as its near ally, *G. sino-ornata* seems to become more apparent as time goes on. In a good many gardens visited this year, where the two species had been given an even start, *G. sino-ornata* is still strong and healthy, but the other is anything but satisfactory, if not altogether absent.

A series of wet summers may have been detrimental to the well-being of *G. Farreri*, for if one can come to any definite conclusions regarding its requirements it seems fairly obvious that it will not withstand such moist conditions as *G. sino-ornata* enjoys so heartily. Even so, a number of plants put out last spring in a fairly cool but well-drained bed of gritty soil, with plenty of old leaf-mould, have, for the most part, turned pale and sickly. Yet in precisely similar conditions, indeed, in the same bed, *G. sino-ornata* and *G. verna* are doing splendidly. If one may judge by the respective prices of these two *Gentians* in catalogues, the nurserymen are also finding *G. sino-ornata* easier to manage than *G. Farreri*. A. T. J.

BULB GARDEN.

CROCUS ZONATUS.

THE true autumn *Crocuses* receive too little attention in our gardens, and, with the exception of a few, such as *C. speciosus* and *C. longiflorus*, and one or two others, are rarely seen in the average collection of hardy plants. Perhaps this is due to the fact that there is generally no lack of flowers at their flowering time, and that they are therefore less appreciated than their sisters of spring, which come to cheer us after the long, gloomy time of winter. To my mind *Crocus zonatus* is one of the most delightful of these *Crocuses* of autumn. No doubt the brave *C. speciosus*, the "Blue Crocus," is more brilliant in its colouring, and *C. iridiflorus* more distinct and yet very lovely, but *C. zonatus* has a delicate charm which appeals to some of us even more highly than these others do.

I have been enjoying the beauties of a fine clump in a sunny position in my garden, and to me it seems more delightful than ever, with its delicate colouring and shapely blooms. The colouring is described by one reliable writer as "rose-lilac, veined with purple," but bare words do not adequately convey any true impression of the delicacy of colouring possessed by this *Crocus*, although one dare not venture to offer an alternative description. The bearded

throat is yellow, and gives the impression of a distinct zone at the base of the interior of the flower, while the tube is pale buff. The whole aspect of the flower is one of exquisite delicacy and harmony of colour, and a clump or mass in full bloom is a true delight to the flower lover. A native of south Europe and Asia Minor, *C. zonatus* is perfectly hardy, and increases fairly freely in moderately light loam. Like other Crocuses of autumn, it should have a sunny position and, if possible, one sheltered from stormy winds. It is galling, indeed, to have a mass of this or, for that matter, any other Crocus, prostrated by a storm, such as we have had too many of this autumn, and sheltered places where there is no rebound of the wind are most desirable. S. A.

HARDY FLOWER BORDER.

HERBACEOUS CLEMATIS.

THE herbaceous section of Clematis is much neglected, notwithstanding that it contains kinds eminently suitable for the herbaceous border, but which are seldom seen, even in large gardens where other hardy plants are grown extensively.

Clematis recta is probably more often seen than others; this is a desirable species, having erect, wiry growth that requires only a few Hazel twigs for support. Growing from three-and-a-half to four feet high, it bears numerous panicles of sweetly-scented flowers from June to August. Any good garden soil will suit this plant, but where the soil is deficient in lime it is advisable to give a light dressing of lime during autumn.

C. heracleaefolia var. *Davidiana* (Fig. 154) is a choice variety which all lovers of hardy plants should obtain. It grows about four feet high, having much larger foliage than the former; the leaflets on well-grown plants measure from six inches to nine inches long and as much in width. The flowers are delightfully fragrant, of a bright-lavender-blue, and generally borne in closely-packed clusters in the axils of the leaves. Individual flowers resemble those of a Hyacinth, the points of the petals being reflexed. This Clematis flowers during September.

Cote d'Azur flowers at the same time as the last-named and is a rather stronger grower. The flowers are also produced from the axils of the leaves, those on the lower part of the plant being borne in short spikes about six inches long, but, higher up, the spikes become shorter until the top whorl is a closely-packed cluster. A stem in front of me as I write is two-and-a-half feet long and covered with beautiful, reflexed flowers, each one measuring three-quarters of an inch long. The colour is much darker than in the previous variety and to many, more pleasing; unfortunately, the flowers lack the delightful fragrance of *C. h.* var. *Davidiana*; none the less, it is one of the most desirable plants for the herbaceous border during late September and early October. R. F.

HELENIUM PUMILUM MAGNIFICUM AURANTIACUM.

THIS form of the valuable and popular *Helenium pumilum magnificum* was sent into commerce three or four years ago, and after three years' trial I have come to regard it as a decided acquisition. In a border, quite near the fine *H. p. magnificum*, the variety *aurantiacum* is decidedly more impressive than the other, and its richer colouring is much admired. S.

KNIPHOFIA NELSONI.

AMONG the many dwarf Kniphofias which one now finds so useful in the rock garden and mixed border none is more beautiful than *K. Nelsoni*, and this species is distinct enough to more than hold its own anywhere. It is especially valuable as a late bloomer, for it comes to cheer the garden with its fiery torches during the later autumn when most of its kind are going over and flowers in general are few. *K. Nelsoni* may be recognised by its very

slender, dark green, grass-like leaves, which make a bold tuft some twelve inches or more in height. The thin and elegant flower spikes attain about twice the stature of the foliage, and though the individual blossoms are comparatively few, each standing out distinctly instead of forming a close head of bloom, they are an exceedingly brilliant flame-scarlet colour.

This excellent plant is perfectly hardy in a well-drained soil. A good deep loam freely

for the sake of their paniced inflorescences, but, doubtless, many of them are too tender to succeed in this country. A number have migrated to this country and are recorded as aliens that have become more or less naturalised, but they are of no ornamental value. At the Holland Park show a grass was used for decorative purposes, and several people wanted to know the name of it. This was *Panicum bulbosum*, a native of Mexico, which appears to be

FIG. 154.—CLEMATIS HERACLEAEFOLIA VAR. DAVIDIANA.

mixed with grit and rubble and enriched with a little old cow manure suits it admirably. A sunny position is desirable and planting should, for preference, be carried out in spring. A. T. J.

PANICUM BULBOSUM.

THERE are something like 280 species of *Panicum*, though some authors have run them up to something like three times that number by segregation, and the genus has also been divided into many genera by a similar process. One might imagine that several species would have been found of ornamental value in gardens

hardy, at least in the south of England. The stems grow two-and-a-half feet high and are furnished with long, arching, rather broad leaves. Every spikelet consists of two empty glumes and two containing a flower. These glumes are blackish-purple, and what is most important of all, the spikelets are of small size and each is carried on its own slender stalk. Herein lies the ornamental value of the plant, because the stalks of the panicle and all its ramifications are slender and graceful, making the inflorescence a foil to heavy and large flowers of various kinds. J. F.

HARDY PRIMULAS.

THE hardy Primulas make up a group of exceedingly useful plants adapted for various decorative purposes and representing great diversity of habit and growth. Although many of them delight in a cool, moist, rooting medium and shaded conditions, others thrive in open, sunny positions or make excellent subjects for the rock garden. Like many other plants they have come very much before the public eye in recent years owing to the vast number of newly-introduced species, largely from China. So great has been this influx that whereas two or three decades ago it was not difficult for a person to be acquainted with practically all the species then existing, to-day it is only the specialist who can claim to have a general knowledge of the genus. Despite this enormous addition, however, many of the older species retain their popularity as subjects for our rock gardens and woodlands.

P. japonica, one of the most vigorous growing of the Primulas, is amongst the most beautiful of hardy perennials in cultivation. It produces luxuriant foliage and stout, handsome scapes, frequently exceeding two feet in height, which bear five or six many-flowered whorls of variously coloured flowers ranging from rich blood-red to rosy-pink and white. It thrives best in a deep, rich loam, prefers a position where it does not receive continuous sunshine, and is an ideal plant for growing near the water-side. The seeds sometimes take a considerable time to germinate but generally do so quickly if sown so soon as ripe.

P. denticulata and its variety *cashmeriana* represent a section of very showy Primulas valuable for the fine effects they produce early in the year. From large rosettes of Primrose-like leaves stout stems arise in early spring carrying round heads of lilac flowers in varying shades; these remain in beauty for a considerable time. These Primulas thrive in a rich, cool soil, and are charming plants for moist situations in the rock garden. They will endure any amount of sunshine and should be planted in positions free from the influence of overhanging trees. Owing to their early season of flowering, however, they should not be exposed to an eastern aspect, as in such positions the flowers are liable to damage by early spring frosts, whereas in positions where they are protected from the sun's early rays, and thaw is gradual, little damage results.

P. capitata is a very fine species of similar habit which should, however, be planted in a pocket in the rock garden, where it is shielded from the midday sun. The spikes are from six to nine inches high and appear from April to June and bear dense, globose heads of violet-blue flowers enveloped in a white mealy powder.

No question can arise as to the great value of *P. rosea*, a handsome species with a neat habit, equally at home on the well-drained border and in the rockery. It forms dense clusters of bright, glossy-green leaves, from which are thrown up large trusses of medium-sized flowers of the most brilliant rose colour. Few plants can be raised with greater facility, and if individual specimens are comparatively short-lived, there is no difficulty in replacing them.

P. pulverulenta is a very strong grower, often throwing up spikes to a height of four feet and bearing numerous whorls of brilliant, maroon-crimson flowers in May and June. It is free-flowering and somewhat resembles *P. japonica* in habit, but the flowers and stems are thickly covered with a white, mealy powder. It is a handsome plant for moist and partially-shaded positions.

P. Mooreana is of similar habit to *P. capitata* but is valuable owing to its late-flowering character. Its handsome heads of violet-purple flowers are a feature in the rock garden, in August, where it delights in a rich, well-drained soil and prefers a shady spot.

P. helodoxa is a noble plant producing stout spikes often exceeding three feet in height, bearing whorls of bright yellow flowers in June and July. It is an invaluable plant for moist, semi-shaded positions, but it likes a light, rich soil.

P. farinosa, a native plant, though not widely distributed, is a little gem for the rock garden. Its pale lilac flowers, with yellow eye, are arranged in compact umbels on stems thrown well above the leaves. The leaves are small, glabrous on the upper surface and usually covered with a white meal on the under surface. It likes a fairly stiff soil and a moist situation.

P. sikkimensis is an interesting plant of elegant habit bearing large, pale-yellow, drooping flowers in loosely disposed umbels. The individual flowers are of remarkable beauty and suspended gracefully on slender pedicels.

P. Cockburniana, a choice little plant, bears graceful umbels of brilliant, orange-scarlet flowers. It is very easily grown and is a beautiful and distinct species.

P. integrifolia, an elegant little species, has oblong, smooth, shining leaves, and produces tiny scapes only two or three inches high, which bear one to three rose-coloured flowers in early summer.

P. Bulleyana is a magnificent plant, producing stout spikes of orange-coloured flowers of striking beauty in June and July. It is of vigorous growth but needs a cool, moist, rooting-medium.

P. Beesiana, a distinct Chinese species of vigorous habit, produces stout stems, often reaching two or three feet in height and bearing several whorls of rich, velvety-purple flowers with a conspicuous yellow eye.

A most distinct and striking plant is *P. Littoniana*. The long, slender spikes thrown above its oval foliage are of a reddish colour before the flowers open, and in a group give a rich effect; later, as the flowers expand, the mauve colour contrasts strongly with the red tips. It does not like much sun and should be given a cool, shady position.

P. Veitchii is a Chinese species of compact habit, suitable for a moist, cool position in the rock garden. It has attractive foliage and bears bright purple flowers with a rosy tinge. *P. Poissonii* is also a beautiful Chinese species, producing stout stems bearing large, brilliant, rosy-purple flowers, but it is not hardy everywhere.

P. Winterii is a charming Himalayan species, worth taking a great deal of pains with as it flowers in February and March. A position should be given it in a sheltered nook of the rock garden where it is protected by overhanging rocks, but it must not be allowed to suffer from dryness at the roots. The flowers are about the size of those of the common Primrose, but of a beautiful delicate, lavender-blue shade with a distinct zone of white round the conspicuous yellow eye. The whole plant is freely powdered with white farina, which enhances its beauty. A. P. C.

FLOWER GARDEN.

CORTADERIA ARGENTEUM.

THIS plant is still listed in many catalogues as *Gynerium argenteum*. It is one of the most imposing of all the Grasses, and should be grown in all gardens where sufficient space is available.

There are many positions where its stately appearance will be advantageous, either in association with rocks or water, among dark-foliaged Conifers, as a background for mixed borders, or even for the sides of drives and walks.

It thrives best in a deep, rich, alluvial soil which is well supplied with moisture, and requires a fair amount of space above ground to unfold its long, linear leaves, which are produced in dense tufts, four feet to six feet high, and as much through. These leaves have very rough edges, and should be handled with care.

This grass may be raised easily from seeds, and with liberal treatment the seedlings will flower in four years from sowing. This period may be reduced by sowing the seeds in gentle warmth in February and planting the seedlings in prepared beds in May.

There appear to be many different strains of this plant; it is therefore sometimes desirable to propagate by division those plants which produce the finest flower stems, although

these divided plants are usually more delicate than seedlings, and require more protection until thoroughly established.

The old leaves should not be removed until the beginning of May as they afford a natural and usually sufficient protection for the crown of the plant.

The flowers are disposed in very large, terminal panicles on stems often ten feet high. These may be cut and dried before they fade, when they will prove most useful for the decoration of halls and staircases throughout the winter. R. K.

DAHLIA PRESTIGE.

"If I had to name the most perfect Dahlia, I would say, 'Prestige'"; this remark was made to me by Mr. W. Hart, who deals with all Dahlia matters for Messrs. Dobbie and Co.—no mean testimonial to this variety. Many will be inclined to agree with Mr. Hart. Prestige is ideal in habit and form, and rich in its colour tone, and is described by Mr. Stredwick, the raiser, as deep orange, of the decorative type; he also informs me that it is a seedling from the giant-flowered *Berengaria*.

Prestige is a first-rate variety for a large bed, being only about three feet in height, and it flowers with the greatest freedom. It appears that this variety may well be the forerunner of a new type, as it has entire leaves, at least one can very rarely find a divided leaf; this adds to its distinctiveness. Those on the look-out for first-rate Dahlias should not miss this very special plant, which must, I believe, have a great future.

As a companion plant, but light yellow in colour, there is still nothing to surpass *Brentwood Yellow*; though now nearly twenty years old, this fine variety is still unbeatable as a yellow bedding variety. Mr. J. T. West, its raiser, informs me that it is still in demand, and he considers it one of his very best introductions. T. Hay.

TREES AND SHRUBS.

BUDDLEIA ALTERNIFOLIA.

I READ with very great interest "J's" remarks (p. 324) on this beautiful shrub. Undoubtedly he has been most unfortunate in his dealings with it. *Buddleia alternifolia* is one of the most beautiful flowering shrubs introduced during recent years, but I think its success depends largely upon the soil and position in which it is planted. It has a tendency towards vigorous growth, a tendency exhibited right from the seedling stage, for plants from seeds will make bushy plants often two feet high in one year, while plants from cuttings inserted last autumn in sandy soil over a bed of rather rich rooting material have, in most instances, made growths over three feet long. These remarks emphasize the fact that it should not be planted in rich soil; if it is, it will undoubtedly produce rank growths which will not ripen and therefore not flower the following season. This *Buddleia* does very well at Wisley, where several of the plants raised from seeds collected by the late Mr. Reginald Farrer are from eight to ten feet in height, very graceful in appearance, and annually clothed with a profusion of blooms. All these plants, together with several younger plantations, are in light, loamy soil, and in several instances very strong soil, and open, sunny positions. One group, consisting of a dozen or more plants, was planted last spring as one-year-old plants from seeds; they are now three to four feet in height and give every indication of a fine display of blooms next summer, for they are a mass of ripened growths, despite the fact that the season has favoured coarse, rank growth.

Buddleia alternifolia has exactly the type of root to encourage coarseness of growth, making, as it does, either a single or several straight, thick, tap-roots, which are almost devoid of fibres. I know a plant similar to that described by your correspondent; it is planted in deep, rich soil and has made four stout growths about eight feet in length, the laterals of which have not ripened at all,

so that the prospects of a flower display next summer are nil. Apparently, *Buddleia alternifolia* is to be found in poor soil and warm, sunny positions, for the late Mr. Reginald Farrer described it in his field notes (*R.H.S. Journal*, Vol. 42, p. 63), as growing on steep, dry banks and open, warm places—as bushes or small-trunked trees. I have raised several thousands of this shrub, both from seeds and cuttings, and can vouch for its vigour, which can only be held in check, and turned to advantage in the production of blossom, by a careful choice of position and soil. As for being the ideal shrub for small gardens, that is a matter of opinion; personally, I can hardly imagine any garden too small to contain such a gem. A. G. F.

LOMATIA FERRUGINEA.

A LONG time ago I received information concerning some very fine plants of this beautiful shrub growing at Castle Levan Gardens, Gourrock, and recently, by the courtesy of Mr. Traill, I have had photographs taken. These two plants are both about twenty-five feet high, well-grown, bushy specimens, and carry an abundance of the finely-cut *Grevillea*-like foliage characteristic of this native of Chile. The upright iron fence in the foreground (Fig. 155) is four-and-a-half feet high, and, by comparison, gives a fair idea of the dimensions of these specimens. Mr. Traill informs me that the whole of the *Lomatias* growing at Castle Levan (there are quite a number of them) were raised from cuttings about thirty-one years ago, and it is evidence of the skill of the propagator, as well as of the favourable climatic conditions on the shores of the Clyde, to find them still thriving and healthy, as *Lomatia ferruginea* is by no means the easiest of plants to propagate in that manner.

To see these *Lomatias* in flower, a visit was paid in July, two or three years ago, when I was agreeably surprised to find that they flowered most profusely, although many of the clusters of scarlet and gold flowers were partially hidden among the luxuriant foliage. Another point of more than ordinary interest is the fact that these specimens produce good crops of fertile seeds annually and thus provide a much surer means of raising a stock of young plants than the uncertain one of raising them from cuttings. Mr. W. J. Bean, in his *Trees and Shrubs Hardy in the British Isles*, refers very shortly to a plant of *L. ferruginea* growing at Castlewellan, Co. Down, which was ten to twelve feet high, but his description of the flowers leads one to believe that it must be a different variety, as the colours mentioned viz., rosy-red and white, in no way correspond with those of the flowers produced by the trees under consideration. A. T. Harrison.

BERBERIS VERRUCULOSA.

VISITORS from the continent have been known to remark on the fine specimens of *Berberis verruculosa* which are to be seen in this country. The writer knows one garden in Sussex where there is a bush of *B. verruculosa* fully five feet high, nearly as much through, and clothed to the ground with foliage. This is probably an exceptionally good specimen. In several European countries *B. verruculosa* is not considered to be very hardy, notably in Germany and Austria. It would appear that the foliage and younger growths of this Barberry are subject to injury when the early morning sun follows sharp frost, a form of frost-damage which is well-known to growers of Asiatic shrubs. The statement that this species is hardier with us than with our continental contemporaries may possibly be explained by the fact that the frosts experienced in mid-Europe are frequently more severe, and the sunshine infinitely more intense than we are accustomed to in our muggy climate. In passing, it may be noted that *Berberis verruculosa* has proved hardy at the Arnold Arboretum.

B. verruculosa was found by Mr. E. H. Wilson in 1903 in the mountains of Western Szechuan. Wilson was at that time engaged on his second Chinese expedition for Messrs. J. Veitch and Sons, of Chelsea, who received the seeds in the following year, and flowered the plant at Coombe Wood in 1908. *B. verruculosa* is a compact,

rounded bush, having stiffly-arching branches, thickly set with Holly-like leaves, one inch to one-and-a-half inch long, dark glossy-green above, glaucous beneath, and with recurved margins. The young stems are curiously rough or verruculose, and the branches bear thorns about one-and-a-half inch long. Of slow growth, the normal height under congenial conditions varies from one-and-a-half foot to three feet.

fruits. This plant has a further attraction; though otherwise evergreen, it loses a little foliage every autumn, and before these leaves fall they assume striking crimson and scarlet colourings. Sometimes the whole bush will colour, but usually the brilliance is confined either to the lower part of the plant or to an occasional branch. It may be that certain forms raised from seeds exhibit this character in a more

FIG. 155.—LOMATIA FERRUGINEA AT CASTLE LEVAN.

The golden-yellow flowers appear in May, and are followed by violet-black fruits, ovoid in shape, slightly less than half-an-inch long, and covered with an attractive bloom.

The chief characteristic of *B. verruculosa* is its neat habit and dense growth. It is, therefore, an excellent evergreen for the rock garden, and although it cannot be relied upon for a first-class annual display of flowers and fruits, there are seasons when it will surpass itself with a profusion of yellow blossom, and later, if the birds permit, of the large, handsome

marked degree than others; on the contrary, the autumnal colouring may be attributed to the soil or the season.

B. verruculosa may be raised from seeds, but as it is a rather shy-seeder with us it is usually propagated by cuttings of ripened wood, taken with a heel, and inserted in a sandy compost. Though many species of *Berberis* will root during the winter, if the cutting-pots are plunged at the base of a north wall in October or November, those of an evergreen nature seem to require slightly more protection. L. B. C.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C. 2.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Editors and Publisher.—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers.

Urgent Communications.—If sent by telegraph, these should be addressed "Gard. Chron.," Rand; or by telephone, to Gerrard, 1543.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Letters for Publication as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

IDEAL GARDENS AND PLANT LORE.

IN HOMER'S WIDE DOMAINS.

(Concluded from page 288).

REFRESHED by our hours with the Immortals, we now resume our study, and enquire into the name and nature of the Lotos, or Lotus. It frequently happens that confusion is introduced into the study of plants either through one name being differently spelt, or through the same name being applied to different things. Thus the Sycamore and the Sycomore are constantly being mistaken the one for the other. Even Skeat, who is usually so reliable, does not get us out of the wood. In his *Concise Dictionary* these definitions occur:—

SYCAMINE, a tree (L.-Gk.-Heb. ?) L. *Sycaminus*.—Gk. *συκαμινος*; Luke xvii, 6. Prob. a Gk. adaptation of Hebrew *shigmim*, pl. of *shigmah*, a Sycamore; that it has been confused with *Sycamore* is obvious.

SYCOMORE, a tree (L.-Gk.). Better *Sycomore*.—L. *Sycomorus*.—Gk. *συκομορος*, lit. 'Fig-Mulberry'.—Gk. *συκον*, Fig; *μορον*, a Mulberry.

Now while Sycomore is correct for the 'Fig-Mulberry,' Sycamore is the recognised name for the larger Maple (*Acer pseudo-platanus*, L.). This matter was long ago set in its right light by Mr. Leo H. Grindon in his *Scripture Botany* (page 206).

A similar case is that which now confronts us. Did Homer know the Lotus or the Lotos, and which of the different plants so named are we to hold in mind when we read, for example in the *Odyssey* (ix, 93) as follows, in Pope's translation:—

They eat, they drink, and nature gives the feast:

The trees around them all their food produce;
Lotus the name: divine nectareous juice!

Thence called Lotophagi.

Perhaps I cannot do better than quote from the note which is appended to this passage:—

"A great difference of opinion has prevailed among the moderns as to what the ancients intended by the Lotus. Of the existence of a fruit growing spontaneously, furnishing the popular food of nations, there is no doubt. Polybius appears to have seen it in the country of the Lotophagi. There appear to have been two distinct species of Lotus, because Herodotus and Pliny describe a marked difference, the one being an aquatic plant, whose roots and seeds

were eaten in Egypt, the other the fruit of a shrub on the sandy coast of Libya. Herodotus, in writing of the Lybian Lotus (Bk. iv, 177), states that the fruit is of the size of the Mastu (a misprint for Mastic or Mastich, Latin *Lentiscus*, Greek *στυκος*), sweet like the Date, and a kind of wine is made of it. Pliny describes two different kinds, the one found near the Syrtes, the other in Egypt." See also the article on Lotus in Professor de Gubernatis' *Mythologie des Plantes*.

The Lotophagi, or Lotus-eaters, derive their name from the Lotus, Zizyphus, or Jujube (*Rhamnus Lotus*, Linn.), the fruit of which is by some writers said to be like gingerbread, being, when fresh, of a bright yellow colour. To make confusion worse confounded, however, we have the term Lotus applied to a genus belonging to the Leguminosae and some affirm that this is one of Homer's plants. Purves thus translates one of the passages in which the word occurs (*Iliad*, xiv, 348 cont.):—

"So spake the son of Cronus, and caught his consort in his arms; and beneath them the divine earth sent up new, sprouting grass, and dewy Clover, and Crocus, and Hyacinth." This Lotus, Clover or Trefoil, found in the moist lowlands of Greece and Troy was used as the food of horses and cattle. Thus we read (*Iliad*, ii, 776) how "the horses stood each in their chariot place and ate of Clover and Parsley from the marsh." Buckley, unlike Purves, prefers to let the original word remain, and reads:—"Their steeds stood, each near his chariot feeding on Lotus and lake-fed Parsley."

Now while it is clear that Homer does not allude to the Water-Lily or Lotus which fills so great a place in the plant-lore of the East, from Egypt to Japan, it seems equally certain that at least two kinds of plant are mentioned in the *Iliad* and *Odyssey*, and these may be readily distinguished if we use the word Lotus to designate the trifoliate plant on which the horses fed, which some affirm to have been the Melilotus; retaining the form Lotos for the Zizyphus or Jujube tree in whose fruit the Lotophagi took delight.

Time would fail us to deal fully with the legends associated with the Lotus and Lotos, so we content ourselves by referring the reader direct to Homer and his expositors, to Theophrastus and Pliny, to Gerard the herbalist and Tennyson the poet, and to such other writers as these will suggest if he still wishes to carry his researches to the fullest extent. And now, though our subject might have been greatly enlarged if we had quoted from others instead of falling back on our own researches, it is time to gather up the results of our study.

Our ideal Homeric Garden will be an extensive one. It will be divided into flower borders, vegetable plots, tree gardens or bosquets, vineyards and fruit gardens, lawns and pastures, cornfields and plantations. In the flower borders we shall find a place for such plants as the Poppy, Hyacinth, Iris, Larkspur, Narcissus, Violet, Crocus, Asphodel, Lily, Gladiolus and some others. Ivy is mentioned (*Odyssey*, xvi, 50) as an ornament. Onions, or Leeks (*Iliad*, xi, 629) we shall grow to give a relish to the wine cup, and Garlic or Allium of kinds to recall the Moly. For this see the note in Pope's translation of the *Odyssey*, x, 365. Cresses there will be, with Lettuce, Parsley and Beetroot; Barley, Wheat and Flax will also find a place.

In lawn and meadowland, glade and lakeside, the Melilot, or Clover, and the Parsley will flourish, while the fruit garden and orchard will bear abundance of Figs and Olives, Pears and Apples. These last may be either the Pomegranate, Apples of Gold such as Oranges, Lemons and Citrus, or the more homely yet not less delicious fruits with which our own orchards abound. The Vineyard will be in evidence though we may require to enclose it with glass.

For shrubs and trees we shall turn to the Tamarisk and Lotos, or Zizyphus, the Willow, Elm, Plane and Poplar, the giant Oak and towering Pine. Alder, Cornel and Cypress will blend with Cedar and Frankincense, while the Ash and Beech may justly claim a place. The list is no mean one, and will supply us with plants which, like those in Eden, are alike pleasant to the sight and good for food. *Hilderic Friend*.

NOTES FROM EDINBURGH.

TREES and shrubs have taken on their autumn tints quickly and there are now many beautiful colour effects. There are countless suitable subjects to select from with colours and shades to suit all tastes, from the golden-yellow European *Acer platanoides* to the glorious fiery-crimson-tipped *Stranvaesia Davidiana* of China, or the Japanese Maple, *Acer palmatum*, and its many varieties with glorious colour. From amongst the Rowan family, *Pyrus Aucuparia* discolor and *P. rufo-ferruginea* might be taken as examples. The Scarlet Oak, *Quercus coccinea* and its companion *Q. rubra*, the Red Oak of North America, are well worthy of mention among trees grown for autumn effects. Those who have colour schemes in view and intend planting for autumnal effects should pay attention to selection so that there may be no regrets and disappointments when next autumn arrives.

The advancing season has reduced the number of flowering plants but, fortunately, there are still a number whose late-flowering period is more than welcome. One in particular, and not commonly known, is *Dracocephalum Forrestii*, a native of China. As a bedding plant it is unsurpassed for its beauty and fragrance. It grows best in a soil which is retentive of moisture but must also have ample drainage. From seeds sown in February the seedlings planted out in April will produce plants to flower in September and be at their best in October. The main stem terminates in a crowded head of beautiful blue, labiate flowers, while from twelve to eighteen lateral, flowering shoots are also produced, giving the whole a bushy appearance.

The late-flowering form of *Gentiana asclepiadea* is still adding beauty to its drab surroundings and looks best when grown in large clumps. It responds to plenty of moisture and looks very pretty by the pond-side.

The persistent-flowering *Dianthus Knappii*, a native of Hungary, is very attractive; being yellow in colour it is unique among members of that family. The flowers are borne on stems with long internodes, which give it a straggling appearance, but its floriferous habit compensates for this effect. Few cuttings are available for propagation, but the plant may be raised easily from seeds.

Omphalogramma Farreri, which develops winter buds, and flowers early in the spring, before the leaves are fully expanded, has for the second time this year gone through this routine. During the recent heavy rains it shed its leaves and has since produced two beautiful, perfect flowers without any leaves appearing from its miniature Cabbage-like buds. This effort may be detrimental to its future welfare, but at present it looks quite happy. In the same family, *Primula chionantha* and *P. malanops* are still in full bloom. Both are alike in habit and growth, except for the colour of their flowers, the former being white and the latter of a violet-purple colour.

The mildness of the season has enticed quite a dozen plants of *Meconopsis integrifolia* brevistyla to open their large yellow flowers, and this little group is enhanced by appearing over and being surrounded by a thick carpet of fallen autumn leaves from the Lime trees near by.

Schizostylis coccinea deserves all the praise given to it, both for its rich, deep-red flowers and its usefulness at this season. The delicate pink variety, Mrs. Hegarty, is not behind the species for beauty, and both can be relied on to charm lovers of the Iris family. They require a dry, sheltered situation to protect them from frost.

In the rock house, *Nerine Bowdenii*, *N. candida* and *N. sarniensis* are all showing many wonderful spikes of flowers. *N. candida*, with pure white blooms, looks very pretty contrasted with the other two, which are pink and salmon-coloured respectively. They seem to enjoy the freedom of being planted out, and look more natural than when grown in pots.

A pretty little plant of *Coris monspeliensis* is also interesting; although it belongs to the Primula family it does not look like any member of that group. It is of dwarf habit and its slender stems, with somewhat small,

prickly leaves, terminate in inflorescences of beautiful pink flowers. *Calcecephalus Brownii*, although not in flower, is prized for its beautiful, silvery foliage. Not being quite hardy, it requires protection and is quite at home on a dry ledge in the rock house. *Helichrysum crassifolium* is also a very useful plant for foliage effect as its grey, woolly leaves make it very attractive. For a companion, *Lotus Bertholetii* covers a square yard of rock-work with its feathery branches of small, grey, spiny leaves, and in summer it produces countless crimson Leguminous flowers which make a fine picture. *Alex. McCutcheon.*

GARDEN NOTES FROM SOUTH-WEST SCOTLAND.

THAT graceful Chinese Poppywort, *Eomecon chionantha*, does not behave nicely with us, no doubt requiring stronger sunshine than we can give it to do itself justice. Here it grows vigorously, putting up plenty of its handsome leaves and spreading far with fleshy, subterranean stolons, but its white flowers are few and far between. Out it must go, therefore, to make way for something more generous; but I am sorry to expel it, because there is no surer remembrance of absent friends than plants which were their gift, and this one was bestowed on me by that enthusiastic gardener, the late Sir Charles Bine Renshaw, M.P.

Amaryllis Belladonna resents a sloppy summer such as we have just passed through, and makes but a meagre display of blossom. Not so another Cape bulb, *Nerine Bowdenii*, which shows complete indifference to the character of the season, and now, in mid-October, presents us with a crowd of its frilled, rosy flowers. If it were more generally known it would be seen more often in the autumn border, for it is a hardy subject, although in cold districts it should be planted at the foot of a south wall. A charming effect may be secured by planting *Crocus speciosus Aitchisoni* with the *Nerine*, the pale violet of the *Crocus* harmonising admirably with the bright pink of the other. Another good autumnal combination consists of *Gentiana sino-ornata*, planted round or in front of *Polygonum vacciniifolium*. Again, *Rudbeckia speciosa* being half the height of *Aconitum Fischeri*, may be planted in front of the latter, the clear golden rays of the first contrasting admirably with the cool blue of the last.

All colour being purely subjective, it follows that the sensation of colour varies among individual observers; but I confess to having been surprised to see the so-called Golden Elder recommended as a choice shrub in *The Gardeners' Chronicle* of October 8 (page 285). Amateurs are accustomed to turn to *The Gardeners' Chronicle* for guidance, nor, as a rule, do they so turn in vain; but I believe our home landscapes will suffer grievously if many persons follow *A. P. C.'s* advice in planting this coarse, ill-favoured shrub, which already disfigures too many villa gardens. The dry banks which he prescribes as most suitable for it may be far more agreeably clothed with some of the many species of *Barberry* which are now at everybody's command.

Late-flowering shrubs are ever-welcome, even though their display may not attain to splendour. Among them, *Cornus pauciflora* may be noted for a place. Introduced by Wilson in 1907, Mr. Bean describes it in *Trees and Shrubs Hardy in the British Isles* as flowering at Kew in late July and August; but in our latitude it shows no bloom until September, and is now, October 14, profusely set with flat corymbs of star-shaped, white flowers. It has proved quite hardy and has here reached a height of five feet, and is a nicely furnished, rounded bush. More beautiful, but more tender, is *Eupatorium Weinmannianum*, which demands the sunniest possible place to develop the cloud of blossom which at this season envelops a large specimen in Mr. McDouall's collection at Logan. Our only plant here is screened from the south by a large *Ilex*, and the flower-buds with which it is abundantly set will not open in time to escape November chill. *Herbert Maxwell, Monreith.*

PLANTS NEW OR NOTEWORTHY.

TRIPTILION SPINOSUM.

It must be twenty years or more since the Dropmore Gardens gave us the fine *Anchusa* that bears its name and which has proved a lasting memorial to that famous establishment; but so far back as 1827 there flowered at Dropmore for the first time in this country, another blue-flowered plant, *Triptilion spinosum*, but

In the *Botanical Register*, Vol. 27, t. 22 (reproduced in Fig. 156), it is well drawn, and a good description of the plant is given. There is also a very neat figure in Maund's *Botanist*, Vol. 5, tab. 224, and here we get the best description of the plant and are informed that it is the "Siempreviva" of the Chilians, owing to the fact that the flowers are much used for decoration and when cut retain the deep blue of the corolla indefinitely. It is said to have medicinal properties; also that the flowers turn white instantly

FIG. 156.—TRIPTILION SPINOSUM.

of quite different character to the popular *Anchusa*. When this little Chilean subject was first grown it created great interest, and the periodicals of that day have much to say of its rarity and beauty. Most of the gardening journals of that time gave their readers a coloured illustration of the new plant; one of the finest is that in Paxton's *Magazine of Botany* for 1843, tab. 269. It also occupies a page in Harrison's *Floricultural Cabinet*, Vol. 12, tab. 49, where it is entwined with *Stephanotis floribunda*, then a new plant, but this is a poor picture.

when the stems are placed in hot water. All this, and much more interesting matter, is recorded in the *Botanist*.

Being anxious to see this plant in the living state, I asked Mr. W. J. Vasey, who was for some years resident in Chile, to try and secure seeds, and this he kindly did on two occasions, but only one plant was raised in 1925. This plant has flowered quite freely, but our cultivation may not have been of the best, and having so little material to experiment with very little can be said about its cultivation.

Early in the present year, Mr. G. W. Robinson

an old Kewite, gardener at the Villa Serena, Vina-del-Mar, Chile, sent abundant seeds, so that in many gardens there are good stocks of plants which ought to be in evidence during 1928.

Mr. Harold Comber also met with the plant during his Chilean travels and brought home seeds during the present year.

It is only now that anything like a fair opportunity has occurred to grow this species as it was very scarce during the period of its first introduction. It is probably hardy, as Lothian in his book on rock plants, published in 1845, records it as growing on his rockery in Argyllshire. I have seen sufficient of its behaviour to conclude that it dislikes heat, and always looks healthiest when in a cold frame.

The genus *Triptilion* belongs to the Natural Order Compositae. *T. spinosum* is a dwarf, shrubby-looking perennial with small, sessile, lanceolate leaves which, when grown cool, are stiff, with spiny points. The flowers are finely arranged in a terminal corymb, very handsome, of intense blue colour—a delightful shade met with in few plants. The root is tuberous.

Mr. Robinson also sent seeds of a white-flowered species, which is probably an annual; this has flowered in many gardens during the present year. *T. Hay, Hyde Park.*

WOOD WASPS.

WE have in this country two large Wood Wasps, *Sirex noctilis* and *Sirex gigas*. Both are frequently found, and they always cause alarm and no small excitement when they come into the hands of the uninitiated, *S. gigas*, the Striped Wood Wasp, usually causing the most alarm on account of its hornet-like appearance.

They are both large insects, usually measuring about two inches in expanse, but they are somewhat variable in size, the males especially being at times quite small.

Sirex noctilis, or the Steel-blue Wood Wasp (Fig. 157), as its name implies, is of a steely-blue colour, with black antennae and yellow legs. The last segment of the female is longish and drawn out into a short, thick spine. Below this there is a long, horny process—the ovipositor—for the purpose of laying eggs in the timber of Fir trees.

Sirex gigas, on the contrary, has an orange-yellow abdomen, with a broad, blackish-brown band across the middle. As in the former species, the female is provided with a long ovipositor, and it is this process—often mistaken for a sting—which causes the insect to be held in awe. Whereas the females are totally different in coloration, the males of both species are somewhat similar, the bodies being yellow with darker bases and tips. *S. gigas*, however, may be known by its yellow antennae and somewhat duller abdomen. The males of these species are not provided with the long sting-like process seen in the females.

In all probability both species were introduced into this country in timber, and here they have settled down, their numbers being augmented each year by means of shipments of timber from overseas.

The eggs are laid under the bark of Fir trees, and it is said that only sickly trees are attacked. The larvae, on hatching out, bore their way into the hard wood, leaving a perfectly round gallery. When full-grown they are large, fleshy grubs, creamy-white in colour and provided with a pair of legs on each of the first three segments, the remaining segments being provided with a pair of fleshy, wart-like stumps. The last segment is considerably longer than the preceding segments and ends in a short horny spine. They change to pupae in a previously constructed cell, generally just under the bark, the "wasps" hatching out the following summer. "Wood Wasps" may be found during most of the summer months and even until November, when they are active on hot, sunny days. Owing to their slow and heavy flight they are not likely to be passed unnoticed.

They are distributed in timber and though usually to be found in the vicinity of wood-yards, they may put in an appearance almost anywhere, and have been known to hatch out in rooms

of newly-built houses, three or four appearing each day for several weeks.

Though breeding in this country, their headquarters are the Pine forests of Germany and northern Europe, where they often cause serious loss. In this country, however, they seldom occur in sufficient numbers to cause really serious damage, though undoubtedly they are increasing yearly. On occasion, they have been known to cause a certain amount of loss by rendering the timber fit only for fire-wood. *C. A. W. Duffield.*

MESEMBRYANTHEMUM.

(Continued from p. 291.)

I AM of opinion that this genus has been much neglected by collectors in South Africa. It is very probable that several more species remain to be discovered, and as the localities of most of the old species are unknown, it is desirable that they should be rediscovered and their

FIG. 157.—THE STEEL-BLUE WOOD WASP. (*Sirex noctilis*). Left: gallery showing larva; right: damaged wood and wood wasp.

natural habitat made known, as well as information obtained as to the amount of variation that exists among the different species in their native habitats.

According to information received from Dr. Muir, the species of *Glottiphyllum* grow in: "all sorts of places; among gravel, stones, under shrubs and in the open, on thin soil covering rock-slabs and in deeper soil, rarely in rock-crevices." Under cultivation, I find that several species will endure great drought well.

The determination of the species of this genus from descriptions alone is a very difficult matter, therefore, to aid cultivators to identify them, I have made and added sketches of the leaf-tips of most of the species, from living plants, where possible, the tips of both leaves of a pair being represented, as I find that the character of the leaf-tip taken in conjunction with that of the flower very satisfactory for identification purposes; and it is hoped that used in conjunction with the key to the species, these sketches will enable cultivators to correctly determine most of them, but the descriptions should be consulted as well. Hybrid forms, of course, cannot be named by their use. Further, I would also point out that as most of the figures and descrip-

tions are made from plants cultivated in Europe, they may not quite coincide with native South African specimens as, for example, I have been able to indicate in the case of *G. fragrans*, where it will be seen that the small ovate leaves of a native-grown plant are utterly different from that of the cultivated flowering plant that will also be figured; yet under cultivation the leaves gradually pass from the simple ovate form into the other forms. With reference to the names of these plants I would again repeat that where determinations are made by means of the very fine figures of Salm Dyck's work on *Mesembryanthemum* and the erroneous names he has applied to those figures—accepted as being correct without investigation (as all monographers have hitherto accepted them), confused nomenclature will certainly be maintained.

As the synonymy of this genus is exceedingly complicated I give at the end a synonymic index for the purpose of reference.

In the diagrammatic illustration of the generic structure (given on p. 290) the top of the ovary is represented as but very slightly depressed at the centre. The amount of depression, however, varies with the species, for in some species the stigmas are inserted at the bottom of a deep, cup-like depression in the top of the ovary.

Most, if not all of the species of this genus are very minutely ciliate on the edges and keel of the young leaves, a character so common that I have not mentioned it in all the descriptions. The epidermis of the leaves of many species has a somewhat remarkable surface. To the naked eye and to the touch the leaf seems to be very smooth and is often shining, but if examined with a strong pocket-lens, with light falling upon it in a certain way, the surface-cells (or many of them) will be found to be raised and linear or oblong and arranged in rows transverse to the leaf. In some species, however, such as in *G. linguiforme*, the surface-cells are not at all raised in that way, but are even all over the surface. I am aware that this does not give full detail of the surface-cell structure, but it will suffice to make my meaning clear to the average cultivator armed only with an ordinary pocket-lens.

Several species in an adult state have their growths pressed upon the ground, with the leaves edgewise to the sky, but in the younger stages, or when not fully exposed to the sun in the open air, the leaves are generally more or less ascending so that this character cannot be relied upon as being always of specific value.

In my former account of this genus I gave the date of Haworth's *Observations on the Genus Mesembryanthemum* as being 1794; that is the date on the title-page, but I find that the book was issued in two parts, the second part, which contains all the descriptions, being dated 1795, as hereafter quoted.

KEY TO THE SPECIES.

This key to this very difficult genus is the best I have been able to construct from the material available, and may not always prove satisfactory, as I find that the same plant sometimes varies considerably from year to year, and I have not been able to provide for all variations, as some species are very versatile; but would here note that the hook at the end of the leaf is sometimes absent from leaves of species that normally possess it, and the pustule at the base of the leaves of certain species sometimes disappears from starved plants; and also in some species the leaves may now be in two ranks, and at another time the pairs obliquely cross one another!

1. Flowers with distinct pedicels $\frac{1}{4}$ – $2\frac{1}{2}$ inches long. 2

Flowers sessile or subsessile, i.e., with pedicels not rising above the leaf-sheaths or not more than 1–2 lines above them. 14

2. Leaves with two teeth or a slight hump on the flat face, and not more than 3–4 lines broad at the middle. 3

Leaves without teeth or a hump on the flat face, but often with an oblique or slightly hooded ridge or hook at the end of the flat or concave face. 4

3. Pedicels quadrangular, 3–4 lines long. 2, *difforme*

Pedicels terete or 2-edged, 6-12 lines long. **3, semicylindricum**

4. Leaves 2-3 lines broad at the middle and the leaf-pairs crossing one another at right-angles; pedicels $1\frac{1}{2}$ -2 $\frac{1}{2}$ inches long; calyx 5-lobed (in all other species 4-lobed). **27, ochraceum**

Leaves mostly 3-6 (but sometimes up to 7) lines broad at the middle, broader at the base, and, except in 10, *G. apiculatum*, pellucid-dotted as seen when held against the light, and the leaf-pairs more or less obliquely crossing one another.

Leaves 6-12 lines broad at the middle and usually arranged in two ranks (except in 5, *G. cruciatum* and 23, *G. suave*, but sometimes even on the same individual the pairs more or less obliquely cross one another and except in 5, *G. cruciatum*, not pellucid-dotted.

5. Leaves, mostly 3-5 inches long, ascending except when old, and of nearly the same breadth throughout, or tapering at the upper part, the larger of each pair slightly concave on the face; pedicel 9 lines long; corolla 2-2 $\frac{1}{2}$ inches in diameter. **11, concavum**

Leaves 2-3 $\frac{1}{2}$ inches long, one leaf of a pair usually more or less recurved and the other erect, incurved or spreading, tapering from the base or at the upper part to an acute or blunt point.

6. Petals subacute or obtusely pointed, entire.

Petals obtuse and minutely denticulate at the apex.

7. Apex of the larger leaf compressed into an acute edge or keel; pedicel 1-1 $\frac{1}{2}$ inch long and 2 lines thick. **6, longipes**

Apex of the larger leaf beyond the flat face compressed, obtusely keeled and bluntly pointed; pedicel very stout, 9-10 lines long and 3 lines or more thick; stigmas 8-9. **5, cruciatum**

8. Apex of the larger leaf beyond the flat face compressed-subterete, obtusely keeled and bluntly pointed, somewhat nose-like; pedicel about 5-7 lines long and 2 lines thick; stigmas 10. **4, subditum**

Leaves tapering to a subacute apex tipped with a short reddish point or mucro; pedicel 6 lines long, 2 lines thick; stigmas 8. **10, apiculatum**

9. (From 4; leaves 6-12 lines broad at the middle). Leaves with a pustule or swelling at the base on the upper side that is usually of a paler colour than the rest of the leaf, but is at times indistinct.

Leaves without a pustule or swelling at the base.

10. Growths and leaves erect or ascending; leaves 2 $\frac{1}{2}$ -5 inches long, strap-shaped, narrowing at the upper part to an acute or obtuse apex that is tipped (at least when young) with a central, short point or mucro; pedicel 1 $\frac{1}{2}$ inch long and 1 $\frac{1}{2}$ line thick; corolla 2-2 $\frac{3}{4}$ inches in diameter; petals obtusely pointed, entire; stigmas 8. **17, erectum**

Growths and leaves ascending or more or less depressed towards the ground; leaves strap-shaped, very obtuse and with or without a small point at the end of the upper edge, or occasionally slightly hooked or obliquely pointed at the apex; pedicels 1 $\frac{1}{2}$ -1 $\frac{1}{2}$ inch long, 3 lines thick; corolla 2-2 $\frac{1}{2}$ inches in diameter; petals acute; stigmas 10-11. **16, longum**

Growths decumbent or prostrate; leaves directed forwards and downwards, the larger leaf of each pair with a very large incurved hook at the apex and with an elevated ridge along one margin of the concave face; pedicels 3-7 lines long, 3-3 $\frac{1}{2}$ lines thick; corolla about 2 $\frac{1}{2}$ inches in diameter; petals obtuse; stigmas 8-9. **16, longum var. hamatum**

N. E. Brown.

(To be continued).

THE INHERITANCE OF CERTAIN CHARACTERS IN IMPATIENS BALSAMINA, LINN.

IMPATIENS Balsamina, Linn. (known to Gerarde in 1596), on account of its large number of colour varieties, seemed to offer opportunities for genetic research. The experiments were accordingly begun in April, 1924, at the Imperial College of Tropical Agriculture, Trinidad, and in a very short time it became obvious that the subject was particularly well-chosen. There where many other characters, besides colour varieties, to be worked out, and the life history of the plant was exceedingly short; germination occurs in five to eleven days, the first flower bud opens thirty-four to forty-three days after germination, and the flowers take twenty-two to thirty-seven days to ripen seeds. The shortest possible life cycle is thus two months, and one can easily obtain three generations a year. Considering the plant's short life, a great many seeds may be obtained from one individual during the two months in which it

FIG. 158.—IMPATIENS BALSAMINA.
a. a. small lateral sepals; p. petaloid sepal; l_1 , l_1 , large lateral petals; l_2 , l_2 , usually small lateral petals; n, petal holding the spurred nectary.

continues to bear them. As many as 1936 seeds have been gathered from a single plant. The plants occupy very little space, and when many seeds are required the plants should be spaced about eighteen inches from one another, but when in the F_2 and F_3 generations, only about 200 seeds are needed per plant; it was found convenient to sow the seeds three inches apart in rows one foot apart. When plants are needed for crossing they may be raised conveniently in pots. The plants are hardy and do not become diseased.

It will be evident to the reader that the conclusions arrived at have their limitations; the number of individuals per family is too small, especially as most of the latter are of the di-hybrid type, yet the data is sufficient for one to put forward an hypothesis to account for the inheritance of the characters.

Several characters have been studied; the present paper deals, however, with only two of them, viz., (I) Petal Size and (II) Flower Colour, the other characters giving ratios too complex for analysis until further experiments have been carried out.

Structure of the Flower and Details of Crossing.

A normal single flower consists of three sepals, the two laterals being very small, and the petaloid posterior one spurred, and five petals, the two laterals united in pairs (Fig. 158). The whole flower is twisted through 180° due to resupination of the pedicel, so that the petal bearing the spur becomes anterior. The five stamens are mona-

delphous and syngenesious, closely embracing the five-carpelled ovary.

The anthers open two or three days before the bud, and when the latter is quite small. The five stigmas separate a few days after the flower opens. If left to itself the flower will produce selfed seed, the average number of seeds per capsule being about seventeen. Natural crossing does, however, take place in unbaggd plants to the extent of about one per cent., due to the visitation of bees and Lepidoptera.

The parent plants of the crosses, the descendants through six or seven generations from seeds imported from Messrs. Sutton and Sons, were sown in Bamboo pots. Those selected as female parents were placed inside a well-lighted room and were left unbaggd; those selected as male parents were placed outside the room and were bagged by stout paper bags being tied over the whole plant round the top of the pot. The flowers and large buds of the female plants were continually plucked off by forceps, so that none of them at any time, after having been placed in the room, produced any pollen. The stigmas of a particular female plant received pollen from one male plant only; the plant, not the flower, then was used as the unit for crossing. The buds of the female plants were kept so far as possible constantly emasculated, so that it frequently occurred that a stigma was receptive at the same time as the appropriate male plant was yielding pollen.

Emasculation was performed by opening the bud by means of flame-sterilised forceps (pinching off one or two of the petals was found necessary) and lifting off the ring of anthers with a flame-sterilised scalpel.

Crossing was carried out by taking the female plant out to the male, removing the bag from the latter and placing the pollen on the stigmas by means of a flame-sterilised scalpel.

The investigations described in the present paper deal with the mode of inheritance of the factors producing the following characters:—(1) Size of the lateral petals; (2) Flower colour.

F_1 , F_2 and F_3 plants were grown in the open, no special precautions being taken to prevent visitations of insects. In F_3 it was a simple matter to determine which plants were derived from a natural cross, for if one found amongst a group of plants possessing what in other families was a recessive factor, one or two plants with the dominant factor, one would certainly be able to infer that the aberrant types were not derived from selfed seed. Any plant suspected of being a vicinist has not been considered in the ratios, but the number of vicinists occurring in each family is given.

Of the five crosses made only seeds from the first and fifth were selected in F_1 to give F_2 plants. The F_1 of the first cross contained five plants, giving five F_2 families. Counts were made from the F_3 progeny derived from the first and fifth of these families. The fifth cross, containing only one plant in F_1 was continued to the third generation.

I.—Size of the Lateral Petals.

Considering a pair of lateral petals, the posterior (anterior in a very young bud) may be quite small (simply truncated or possessing a small lobe overlapping the anterior petal), or it may be large and equal in size to the anterior (Fig. 159).

The character under consideration was not recorded in the parent.

F_1 .—Of the five F_1 plants, four were small and one was large.

F_2 .—The large-petalled variety of F_1 bred true to large, whilst the other families segregated in the following proportions:—

| Family. | Small. | Large. |
|----------|--------|---------------------|
| 1 | 44 | 14 |
| 2 | 109 | 27 |
| 3 | 131 | 31 |
| 4 | 98 | 23 |
| | 382 | 95 |
| Expected | 355 | 119 (on 3:1 basis). |

F_3 .—Of the twenty-two F_3 families derived from the first F_2 family, five gave only small and eight gave only large. The rest, the selfed

progeny of small-petalled parents, segregated in the following proportions:—

| Family. | Small. | Large. | Vicinists. |
|----------|--------|---------------------|------------|
| 1-1 | 53 | 13 | 6 |
| 1-4 | 47 | 8 | — |
| 1-19 | 45 | 17 | — |
| 1-30 | 48 | 10 | — |
| 1-48 | 41 | 13 | — |
| 1-49 | 36 | 13 | 1 |
| 1-56 | 30 | 17 | 1 |
| 1-58 | 61 | 12 | 1 |
| 1-68 | 50 | 16 | 6 |
| Expected | 411 | 119 | 15 |
| | 397 | 132 (on 3:1 basis). | |

It is evident, then, that "smallness" and "largeness" constitute a simple Mendelian pair of factors, and that smallness is dominant over largeness. The symbol "S" will be used to denote "smallness" and "s" largeness in petal size.

II.—Flower Colour.

The large lateral petals and the fifth petal (the posterior petal in the open flower) give the flower its predominant colour, the bases of these petals and the other petals being in coloured flowers rather more blue. In all flowers, white included, there is a yellow spot on the sepal bearing the nectary, and in coloured flowers the laterals have a light spot on them.

The present paper deals with the inheritance of the following flower colours:—Peach-blossom pink, Magenta-mauve, Rosy-scarlet and Magenta, and their relation to White. In all the coloured varieties with which we are here concerned, the plants possess red stems, whilst the white-flowered forms possess green stems.

Of the F_2 plants one bred true to peach blossom, one to magenta-mauve, two to rosy-scarlet; seven to white in F_3 .

MAGENTA \times WHITE.— F_1 . Four magenta to one magenta-mauve. Evidently, then, one or both of the parents was heterozygous.

F_2 .—The five families segregated into the following proportions:—

| Family. | Magenta. | Magenta-mauve. | Rosy-scarlet. | Peach-blossom. | White. |
|---------|----------|----------------|---------------|----------------|--------|
| 1-1 | 28 | 6 | 12 | 2 | 10 |
| 1-2 | 1 | 84 | 0 | 27 | 24 |
| 1-3 | 87 | 22 | 22 | 7 | 35 |
| 1-4 | 57 | 20 | 15 | 4 | 26 |
| 1-5 | 66 | 15 | 0 | 0 | 22 |

F_3 .—Counts were made in the families derived from F_2 families Nos. 1 and 5. The mode of inheritance of the factors involved is made evident by the ratios obtained in the F_3 generation, so we will take the families which segregated into only two colour types first, in order to demonstrate the inheritance of one type at a time.

INHERITANCE OF COLOUR.—As may be seen by inspection of the Table at the end of the paper, the F_3 families segregated into:—

| Coloured. | White. |
|--------------|---------------------|
| 674 | 222 |
| Expected 672 | 224 (on 3:1 basis). |

Evidently there is one factor (say, "P") for producing coloured flowers and red stems, in the absence of which the flowers are white and the stems green (let "p" symbolise this absence).

INHERITANCE OF PEACH-BLOSSOM PINK.—

The only family 1-1-22, the progeny of a peach-blossom parent, segregating into peach-blossom and white, gave the ratio: 26 peach-blossom to 19 white, with three rogues (one magenta-mauve and two rosy-scarlet). This, of course, is a very bad 3:1 ratio, but it will be demonstrated shortly that peach-blossom and white are a pair of allelomorphic characters, peach-blossom containing the dominant colour factor "P" and white the recessive "p."

INHERITANCE OF MAGENTA-MAUVE.—Segregation into magenta-mauve and peach-blossom occurs in family 1-1-24, the progeny of a magenta-mauve parent, and gives 51 magenta-mauve to 20 peach-blossom (expected 53:18); magenta-mauve and peach-blossom constitute, then, a pair of allelomorphic characters.

The segregation into magenta-mauve, peach-blossom and white bears out what has been stated of the inheritance of peach-blossom and magenta-mauve. One F_2 and three F_3 families were found segregating into the above types, and the

sum of the ratios was as follows:—(See Table for families concerned).

| Magenta-mauve. | Peach-blossom. | White. |
|----------------|----------------|----------------------|
| 176 | 62 | 69 |
| Expected 173 | 58 | 77 (on 9:3:4 basis). |

Evidently there are two factors concerned—the colour factor "P" by itself producing peach-blossom, and in combination with another factor (say, "M") producing magenta-mauve. The colours will then have the constitution:

| PM. | Pm. | pM. | p.m. |
|----------------|----------------|--------|------|
| Magenta-mauve. | Peach-blossom. | White. | |
| 9 | 3 | 4 | |

The constitution of the magenta-mauve parents was evidently PpMm.

INHERITANCE OF ROSY-SCARLET.—Segregation into rosy-scarlet and peach-blossom occurs

FIG. 159.—IMPATIENS BALSAMINA.

A., posterior petal truncated; B., posterior petal the same size as the anterior.

in family 1-1-33, the progeny of a rosy-scarlet parent, and gives 61 rosy-scarlet to 22 peach-blossom (seven vicinists—six magenta, one magenta-mauve). The expected ratio on a 3:1 basis is 63:21. Rosy-scarlet constitute, then, a pair of allelomorphic characters.

The segregation into rosy-scarlet, peach-blossom and white bears out what has been stated of the inheritance of peach-blossom and rosy-scarlet. Four F_3 families were found segregating into the above types, and the sum of the ratios was as follows:—

(See Table for families concerned).

| Magenta-mauve. | Peach-blossom. | White. |
|----------------|----------------|----------------------|
| 129 | 51 | 57 |
| Expected 133 | 44 | 57 (on 9:3:4 basis). |

Evidently there are two factors concerned—the colour factor "P" by itself producing peach blossom, and in conjunction with another factor (say "R") producing rosy-scarlet. The colours will, then, have the constitution:—

| PR | Pr | pR pr |
|---------------|----------------|--------|
| Rosy-scarlet. | Peach-blossom. | White. |
| 9 | 3 | 4 |

The constitution of the rosy-scarlet parents was evidently PpRr.

It will have been noticed that the inheritance of rosy-scarlet is precisely analogous to that of magenta-mauve.

INHERITANCE OF MAGENTA.—Segregation into magenta and magenta-mauve occurs in F_3 families as follows:—

| Magenta. | Magenta-mauve. |
|----------|----------------|
| 45 | 16 |

This is a good 3:1 ratio. Magenta and magenta-mauve are, therefore, a pair of allelomorphic characters, magenta being dominant.

Segregation into magenta, magenta-mauve, rosy-scarlet and peach-blossom occurred in family 1-1-10 (the parent was magenta), and was as follows:—

| Magenta. | Magenta-mauve. | Rosy-scarlet. | Peach-blossom. |
|-------------|----------------|---------------|---------------------|
| 27 | 11 | 7 | 3 |
| Expected 27 | 9 | 9 | 3 |
| | | | (on 9:3:3:1 basis). |

Magenta, as we have seen, is a simple dominant to magenta-mauve; that it can throw rosy-scarlet as well, points to its also being a simple dominant to rosy-scarlet. Hence, we may suppose that magenta consists of a combination of magenta-mauve and of rosy-scarlet. The constitution of magenta would then be "PMR" and the above ratio could be represented as follows:—

| PMR | PMr | PmR | Pmr |
|----------|----------------|---------------|----------------|
| Magenta. | Magenta-mauve. | Rosy-scarlet. | Peach-blossom. |
| 9 | 3 | 3 | 1 |

and the genetic constitution of the parent must have been PPMmRr.

| Family | Expected on basis. | Constitution of Parent. | Magenta. | Magenta-mauve. | Rosy-scarlet. | Peach-blossom-pink. | White. | Vicinists. |
|---------|--------------------|-------------------------|----------|----------------|---------------|---------------------|--------|------------|
| 1-5-33 | — | PPMMRr | PMR | PMr | PmR | Pmr | p?? | — |
| 1-5-76 | — | " | 19 | 10 | — | — | — | — |
| | — | " | 22 | 6 | — | — | — | — |
| 1-1-10 | 3:1 | — | 41 | 16 | — | — | — | — |
| | — | PPMmRr | 43 | 14 | — | — | — | — |
| 1-1-61 | 9:3:3:1 | — | 27 | 11 | 7 | 3 | — | — |

*The only 1-2 F_3 family from which counts were made; it is evidently segregating in the same fashion as 1-1-19 and 1-1-58.

Summary.

(1) The inheritance of a character, not frequently met with in flowers, has been studied viz., the inheritance of the size of certain petals and it was found that "smallness" is a simple dominant to "largeness."

(2) It has been shown that, in the varieties dealt with, there is a colour factor, in the absence of which the flower and stem will be white and green respectively. If it is associated with a blueing factor the flower will be purple ("magenta-mauve"), or if with a reddening factor the flower will be scarlet, or if both are present, in addition to the colour factor, the flower will be magenta.

In conclusion, I must express my indebtedness to my friend, Dr. S. C. Harland, late Professor of Botany and Genetics at the Imperial College of Tropical Agriculture, for suggesting lines of research, and for his valuable assistance in the interpretation of the ratios, and for his kindly criticism of the present paper. I would also like to express my thanks to Sir Francis Watts, late Principal of the Imperial College of Tropical Agriculture, for placing land and labour at my disposal. *B. S. Bedell, B.Sc.*

HOME CORRESPONDENCE.

[The Editors do not hold themselves responsible for the opinions expressed by correspondents.]

Fruit Thieves at Westminster—At the Fruit Show held at the Royal Horticultural Hall on the 11th inst., I was unfortunate in having a whole collection of fruit stolen, from Class 14, namely twelve dishes of hardy fruits. This happened by 6.15, while my assistants and self were packing two other collections. The classes in which I exhibited were distributed in various parts of the Hall, which made it quite impossible for me to have kept the lost collection under observation. The thieves were very smart in stealing the collection within fifteen minutes of the official time to start clearing, and some very clever thieves must have been at work. It would be interesting to learn if any other exhibitors suffered likewise. A Society of such high standing should afford more protection to exhibitors from such light-fingered individuals by clearing the Hall at the appointed time of closing, and by admitting exhibitors only by means of a clearance pass. This method would eliminate or considerably reduce the number of sharks who are always hanging around exhibitions. *Wm. Jas. Penton.*

Tap-roots.—A friend has recently observed that the reason *Cupressus macrocarpa* is often blown over is because the tap-root is either removed or bent to one side. In my own case (see p. 294), I transplanted seedlings and the tap-root would be mostly intact, but I can see that Cypress trees planted from pots would have no proper tap-root for anchorage. My friend's remarks set me pondering on the question of tap-roots generally, and it is very clear that they are of prime importance in holding a large tree to the soil. I need draw no diagram to illustrate the principle involved. Nature applied principles long before man came along and discovered them! *W. J. Farmer, The Hive, Redruth.*

Staking Freesias.—I was interested in Mr. Rowles' method of staking (p. 333), which is a very useful way, but I would suggest a better and more economical method, i.e., Allwood's Carnation supports. These wires require only one stake in the centre. They last for years and are easily fixed and adjusted. I have tried many methods and appliances, but Allwood's wires beat everything, and I use nothing else for pots of four-inch diameter and over. *G. H. Dalrymple, Bartley.*

Imported Flowers at Exhibitions.—Further experience at flower shows this summer accentuates the desirability, nay, the real necessity of resisting the further or continued introduction in non-competitive trade exhibits of produce

not raised by the exhibitor, otherwise it may grow into a habit, and become a recognised custom; an undesirable one, misleading to the public. It is also desirable that the leading horticultural societies should allocate expert judges for each important class of plants, and instruct them to give fewer marks for mere arrangement, and more for the quality, rarity or variety of the subject exhibited, unless it is a mere decorative group. Take the case of a well-known and excellent cultivator of Gladioli in the north, whom I have in mind; it will apply to other flowers and other exhibitors in like case. He spends an infinitude of care and labour, he gives a great portion of his own time to their cultivation, and raises some very lovely new varieties. He enters for a leading exhibition and looks forward with a thrill of anticipatory triumph to the day of the show. He stages his exhibit and those who are connoisseurs of Gladioli assure him that he cannot fail to secure the coveted highest award. Nothing of the kind! The cards are brought around and he finds that the first prize has gone to flowers that are better "put up" than his, i.e., with some nice Asparagus in and about it—"a real credit to the show." He is staggered. His trade friends rally round and assure him that the award is "nothing short of a scandal." Perfect strangers address him in the same strain. He retires home with diminished head and decides that he will not risk the same treatment next year. Is this to the good of horticulture? Much the same happens with the exhibitor of a trade group "not for competition," for medals awarded to which there is now great competition. He succumbs to a rival firm who may have purchased English or foreign flowers by the van load. The disgusted exhibitor of his own new and rare productions gets every kind of advice given to him: "Leave that particular society or show alone"; "Arrange your flowers with a background of pink with green spots, as it is believed that this is the particular colour which appeals to the President of the Society"; "Make yourself more known personally to the powers that be"; "The best thing is not to mind, judges are bound to make mistakes"; "Why don't you buy a lot of flowers like so and so?" Orchids and fruit sections usually have special judges, but certain show sections are frequently judged either by specialists in another subject, or by a committee composed of excellent men of varied horticultural attainments, of whom perhaps none have any real expert knowledge of the particular class of plants. The time has come, for instance, for the Gladiolus to be judged by Gladiolus experts. *Nurseryman.*

PUBLIC PARKS AND GARDENS.

POOLE Town Council has under consideration the provision of a recreation ground for Branksome.

THE National Playing Fields Association has been asked to negotiate for the acquisition of four sites, totalling thirty-five acres, for conversion into playing fields. The Town Council has purchased ninety-nine acres of land at Derwent Crook for pleasure grounds.

THE Miners' Welfare Fund Executive has made a grant of £1,000 towards the provision of a recreation ground and park for Caerau, Maesteg.

SWANSEA Parks Committee has authorised the clerk to negotiate for the purchase of land at Ravenhill for a recreation ground.

It is announced that the Whitby Urban District Council has acquired the whole of the sea front from White Point to Upgang and that an anonymous donor has offered to lay out twenty-eight acres on the Gallows Close Farn on the east side of the town, as a public park,

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, Ante pp. 131-137).
(Continued from p. 333).

ENGLAND, S.

SURREY.—The spring of 1927 will long be remembered for one of the most beautiful displays of all kinds of fruit blossom, but the cold spell from April 27 to May 2 completely wrecked all our hopes of a great fruit crop—9° of frost were registered on April 27, 8° on the 28th, and 7° on May 1st. Nearly all bush fruits suffered very much, especially dwarf, bush-trained Apples—but most of the standards are bearing good crops, although quantities of fruit fell late in the season. Pears are a fair crop on the walls but quite a failure in the open. The same remarks apply to the Plums. Our soil is mostly light and sandy with a gravel sub-soil. *G. Carpenter, West Hall Gardens, Byfleet.*

—Taken as a whole, the fruit crop generally is a very fair one this year. Apples are certainly above the average, including the popular Blenheim Pippin, Cox's Orange Pippin and Lady Henniker. Pears, too, especially on old trees, are carrying good crops, but wall trees are cropped very lightly. Plums were much below the average and so were Cherries, excepting Morello. Gooseberries, Raspberries and Currants have all given splendid crops of very clean fruits this season. Strawberries, too, have borne a good crop of better quality and flavour than last year. Peaches outside were cropped sparsely, but Figs give fair promise, and the same may be said of Filberts and Cob Nuts. The soil in this ancient garden is very light, on gravel. *John H. Shipley, Haling Park Gardens, South Croydon.*

—During the month of June we registered 35.1 mm. of rain, which helped to swell the fruits considerably, especially all varieties of small fruits, which have carried good crops of large-sized berries. All varieties of Apples carry heavy crops, with the one exception of Ribston Pippin. Doyenné d'Ete is the only Pear which is carrying a good crop. The soil here is sandy loam on gravel. *O. Maddock, Ham House Gardens, Richmond.*

—Late frosts destroyed much of the Strawberry bloom and subsequent wet weather spoiled the small crop. Pears, Apples (some varieties), Plums and Gooseberries also suffered from late frosts. Raspberries and Currants benefited from the frequent rains and yielded fruits of good size, although harvesting conditions were bad. The soil is shallow, on chalk. *G. E. Twinn, Polesden Lacey Gardens, Dorking.*

SUSSEX.—This is the best fruit season we have experienced for very many years. Apples have had to be thinned, also Pears; the latter are a wonderful colour. Plums and Damsons carried exceptional crops. The foliage has improved wonderfully here on the Pear walls; last autumn we removed several inches of soil and brought the roots up to the surface; the trees have responded to feeding. Cherries were very clean and old trees carried a full crop. Strawberries showed an improvement, especially those that were planted in the early part of August, 1926. The soil is a medium loam over green sandstone; in some parts it is a very heavy, yellow clay. Spring frosts only damaged the young growth of box edging; 9° was the most we experienced. *F. Streeter, Petworth Park Gardens, Petworth.*

—The Apple crops are very heavy, with few exceptions; standard, bush and cordon-trained trees are laden with fruits, even after a second thinning; the fruits are fairly clean and of good size. Pears carry a heavy crop on most trees, and the fruits are of good size. Plums Prince Engelbert, Orleans, Belgian Purple, and Cooper's Black cropped heavily on standards, while wall trees of Coe's Golden Drop and Reine

Claude de Bavay had good crops, but Denniston's Superb and Gages were damaged by cold weather when in flower and did not set well. Good crops of sweet and cooking Cherries were somewhat spoiled by heavy rains. All bush fruits carried abundant crops; Strawberries were very promising until the frosts, in May, which destroyed them. Figs have cropped heavily and are ripening very well. *E. Neal, Tilgate Gardens, Crawley.*

—Fruit crops are good in this district, as we escaped the severe frosts at the end of April, 4° being the most registered in these gardens. *John W. Dickinson, Castle Gardens, Arundel.*

—Most varieties of Apples carry good crops, but cooking kinds are more heavily cropped than dessert sorts. Mr. Gladstone, Worcester Pearmain, Allington Pippin, Early Victoria, Lord Grosvenor, Lane's Prince Albert and Bramley's Seedling have heavy crops; Cox's Orange Pippin, Beauty of Bath and Newton Wonder, rather light crops. Pears are a failure, with the exception of a few of the coarser varieties. Amongst Plums the only varieties to crop well were Rivers' Early Prolific and Czar, frost having destroyed the abundant bloom of several varieties, notably Victoria and Pond's Seedling. Amongst bush fruits, Gooseberries gave only moderate crops, owing to frost; Black Currants had a good average crop, except in low-lying spots, where frost caught them. Red Currants were abundant but rather small, and Raspberries a full crop of good quality. *E. M. Bear, Magham Down, Hailsham.*

—Although a good deal of fruit dropped from heavily laden Apple trees, we have a heavy crop of good clean fruits. Apple, Pear and Plum trees have rarely presented a cleaner or more healthy appearance. A few varieties of the two former suffered severely from the effects of late April frosts, whereas the condition of others gives ample proof of their ability to withstand even the low temperatures then experienced. Bush fruits were plentiful and of good quality, but Strawberries, although producing a fair average crop, are so undermined in constitution in this part of the county that reliable crops are no longer to be depended upon. Apricots were a failure in this lime-free soil; the tree grows vigorously and flowers abundantly, but the fruits fail to develop. Our soil is sandy clay overlying sandstone rock. *E. Markham, Gravetye Manor Gardens, East Grinstead.*

—All fruit trees promised well at blossoming time, but the severe frosts at the end of April spoilt the prospects for Apples, which were in flower at the time. Pears and Plums were well set by then, and were not badly affected, but the continuous cold east winds, lasting for several weeks, led to very severe attacks of leaf-blisters on outdoor Peaches, and the young fruits dropped as a consequence. Such weather conditions generally lead to severe aphid attacks on Plums, but I have never had the trees so clear of this pest before, which result I attribute to winter spraying with Carbo-Krimp. Apple trees also sprayed with this tar-oil wash have remained quite free from insect pests so far this summer, although unsprayed trees have had their usual caterpillar and aphid attacks. *T. E. Tomalin, Stansted Park, Emsworth.*

WILTSHIRE.—Apples are an average crop and clean. There are a few exceptions, namely Bramley's Seedling, Newton Wonder and Charles Ross. These trees were in bloom when the frosts of April 27 and 28, 10° and 9° respectively, destroyed the blossom. Pears and Plums in bloom at this period suffered considerably, consequently some trees carried good crops and others hardly any. Sweet Cherries, May Duke, on south-west walls, escaped frost damage although in bloom at the time; Morello Cherries were fairly good. Peaches and Nectarines carried good crops. Small fruits were good and plentiful, particularly Raspberries and Black Currants. Strawberries were very poor, frost having spoiled much of the early bloom; I may add that in

this district many varieties of Strawberries appear to have deteriorated, only varieties like Madame Kooi giving fair crops. The soil is of a light nature on a chalk or gravelly subsoil. *S. W. Tucker, Longford Castle Gardens, Salisbury.*

—All fruit trees promised exceedingly well and set fruits freely, but frosts on April 27, 28 and 30 (9°, 11° and 7°) destroyed all hopes of good crops in exposed positions. Apples Wealthy, Rival, Worcester Pearmain and Cox's Orange Pippin have fair crops, but Bramley's Seedling has entirely failed in this district. Raspberries and Strawberries were all spoiled by severe weather. *H. H. Mills, Fonthill House Gardens, Tisbury.*

ENGLAND, N.W.

WESTMORELAND.—The fruit crops in this district are under the average, owing to the late frosts and sunless weather, excepting Cherries, Peaches and Nectarines, which we had protected. The soil here is for the most part of a gravelly nature. *Robert Dacre, Underley Gardens, Kirkby Lonsdale.*

—All fruit crops were exceptionally late as the result of a cold, sunless spring; the minimum night temperatures recorded here for the month of June were the lowest experienced for over a period of twenty years. Small fruits generally were good, including Strawberries. *Jas. Jeffrey, Lowther Gardens, Penrith.*

(To be continued).

FRUIT GARDEN.

APPLE WEALTHY.

THE Apple named Wealthy is not so well known in many parts of the country as it should be. In our gardens we have Wealthy as espaliers and also as standards, and for the last three years (and they have been real lean seasons) we have had good crops. Its growth is thin, hence the necessity for carefully pruning the leaders in the standards. If left, the branches will form half circles when carrying fruit. Our soil is gravel over chalk, but with shallow planting the trees have done well. With espaliers, the usual August pruning and tying down gives us good results, and this season we had a heavy crop. The fruits are of average size, slightly ribbed and streaked on the sunny side. The stalk is very thin. Whilst the flavour, perhaps, is not first-rate, it is good, and following Worcester Pearmain in season, it fits in with the supply of dessert fruits. Even in variable seasons it is a dependable Apple. *G. W. Stacey, Chorleywood Cedars.*

FRUIT TREES AND THE WET SEASON.

AFTER such a wet season it is a pleasant surprise to find buds on fruit trees, especially Apples and Pears, are in excellent condition; indeed, I have seldom seen a finer lot of fruit buds than we have at present. The size and plumpness of the buds is remarkable, which shows clearly that the wet season has suited the trees and assisted them to carry heavy crops of well-finished fruits and plump up their fruit buds, while the roots are in a healthy condition.

"Market Grower" has stated that fruit trees generally were in a condition to carry heavy crops this season after the scanty crops of last year, but I find that trees which bore well last season have also cropped well this year. This seems to emphasize the need of thinning the fruits in their early stage so as to prevent excessive seed production and allow surplus energy to be devoted to fruit-bud formation. This done, and given proper attention, I see no reason why most varieties should not bear annually.

As regards severe frost not destroying fruit

blossom, I know of one very good southern garden where fruit trees are particularly well grown and where the crop was scanty last year and this year. Eleven degrees of frost were registered while the trees were in blossom, and the locality is rather damp, no doubt this accounts for the disaster. I believe, however, that a certain amount of frost, provided the atmosphere and blossoms are dry at the time, seldom causes harm. Woolly aphid has been very prevalent this season, and I have never found it spread so rapidly before. The trees in these gardens were clean at the commencement of the year, with the exception of a very slight infestation here and there, and such trees were well treated and cleaned; now the attack is almost general, even on quite young trees. Methylated spirit is quite an efficacious remedy, though it is difficult to use on large trees, hence we are now spraying with a strong solution of soft soap and sulphide of potassium, also with paraffin emulsion, while the foliage remains on the trees, but more drastic measures will be carried out so soon as the leaves have fallen. I wonder if others are experiencing a similar infestation this season? *R. H. Crockford, Horsley Hall Gardens, Gresford.*

THE APRICOT.

THE Apricot is one of our most esteemed and luscious fruits, but success in its cultivation is by no means certain. For outdoor culture a south-west position and a well-drained border are desirable, and to obtain reasonable success a light, fibrous soil should be provided; on heavy soils, old mortar rubble should be added, but the depth of soil should not exceed two-and-a-half feet to three feet in either case.

It is hopeless to expect a satisfactory crop of fruits unless the blossoms are protected. Two or three thicknesses of fish netting will afford considerable resistance to frost, but glass copings provide the best means of protecting Apricot blossoms. The Apricot often blooms in February, hence the need of protection.

Under glass, the Apricot is more sensitive to heat than any other kind of hardy fruit, therefore it will not bear forcing, and if a close atmosphere or the slightest excess of heat are allowed the blossoms will drop in showers. When grown under glass Apricot trees should be placed at the cool end of an unheated Orchard house; during the early stages of growth and until the fruits have stoned, a temperature of 45° should not be exceeded. After the stoning period has passed a temperature of 50° to 55° should not be exceeded unless abundance of air is admitted; even 55° may cause the fruits to fall at this advanced stage. Apricots should not be allowed to suffer from drought during the growing season and when carrying a crop of fruits liquid manure should be given the roots at alternate waterings. *W. J. P.*

VEGETABLE GARDEN.

AUSTRALIAN APPLE CUCUMBER.

THIS very handsome fruit (for, like the Tomato, it is a fruit) is easily grown, and in a collection of vegetables or salads makes a useful variation. Seeds sent me from Australia were sown in heat last April and four plants put out in a large, double-light pit. No heat, either from hot-water or hot-bed was used, but the pits were closed early each day; in fact, the treatment was similar to that given to Cucumbers, except that there was no hot-bed, but the plants require more air and less shade from bright sunshine.

Our plants gave us about seventy-five fruits. These should be pale yellow when fit for use, and are usable for a long time. The flavour is very good, and it is claimed for this variety that it is far more digestible than the ordinary Cucumber. An average fruit weighs about four ounces when ripe and contains a fair number of seeds. *G. W. Stacey, Chorleywood Cedars.*

SOCIETIES.

READING AND DISTRICT GARDENERS'.

THE popularity of the Sweet Pea was evidenced by the crowded attendance at the fortnightly meeting held on Monday evening last, which was presided over by Mr. J. R. Lloyd.

The lecturer was Mr. A. W. Gower, The Gardens, Calcot Grange, the most successful exhibitor in the Reading district. Needless to say, his lecture was of the most practical character, and he gave valuable hints on the sowing of the seeds, soil for potting, preparing the ground, stopping, staking, tying, picking out side-shoots, mulching, shading, cutting, packing, staging, and pests. He also gave the names of the varieties which he had found by experience to be the best for a six-vase, nine-vase and twelve-vase competition.

A lengthy and interesting discussion followed, which was sustained by Messrs. Townsend, Fulker, Young, Goddard, Beaumont, Reeves, Gear, Pound, Cox, Martin, Waite, Carpenter, Priest, Nugent and Ridsdale.

A hearty vote of thanks was tendered to Mr. Gower.

There was an excellent entry in the competition for three vases of Michaelmas Daisies, and many beautiful examples of these popular autumn flowers were seen in the twenty-four vases staged. It proved a close contest, and the first prize was ultimately awarded to Mr. A. W. GOWER; the second to Mr. A. H. FULKER, The Gardens, Elmhurst, Reading; and the third to Mr. T. BUTCHER, The Gardens, Glebelands, Wokingham. In the non-competitive section, Awards of Merit were granted to Mr. E. A. BEAUMONT, The Lodge, Copse House, Earley, and Mr. G. EAMES, Reading, the former showing some lovely blooms of September Glory Chrysanthemum and the latter Dahlias. Mr. W. A. PLUMRIDGE, Wessex Hall Gardens, Reading, showed seven dishes of Apples, to which the judges directed special attention.

ROYAL SCOTTISH ARBORICULTURAL.

(ABERDEEN BRANCH.)

DESPITE most unfavourable weather conditions fully fifty members of this branch inspected the woods and policies of Kildrummy on the kind invitation of the proprietor, Col. Ogston. Notwithstanding the drawbacks of unkind weather, the woodmen spent a most profitable and informative day. Professor A. W. Borthwick, of the Chair of Forestry in Aberdeen University, rendered yeoman service by his interesting explanations as the party tramped over moor and fell and through dripping woods.

The party was welcomed at the quarry on the Strathdon road by Brig. Gen. Charles Ogston, nephew of Col. James Ogston, the proprietor, who joined the company later. Led by Mr. Alexander Forbes, head forester of the Kildrummy estate, the first visit was made to Ardhuncart Hill, where an under-planting of Douglas Fir and Larch arrested attention. The trees are about fifteen years old, and it was noted that the Douglas Fir was making much better progress than the Larch. Previous to the under-planting, a very satisfactory crop of Larch was taken here. The elevation of this wood is about 900 feet. Proceeding along the Den of Kildrummy, famed as a beauty spot, a halt was called at a point where an experimental crop of Douglas Fir is being grown and tested on behalf of the Forestry Commission. Col. Ogston bade welcome to the visitors here, and asked Professor Borthwick to explain the nature of the experiment.

Professor Borthwick said the plot, which is a quarter-of-an-acre in extent, was one of the sample plots which the Forestry Commission had, fortunately, obtained permission to measure in different parts of the country. A number of private proprietors had kindly put certain parts of their woods at the disposal of the Commission for that important purpose. The procedure was to select in different parts of the

country different species of trees in representative woods and plantations that were considered to be growing satisfactorily. The trees within the quarter-acre space were numbered, and a ring put round the trunk of each tree, four feet three inches from the ground, in order that the girth might be measured always at the same height. Measurements were made every five years. When thinning took place the trees cut down were used as sample trees, i.e., they were cut into the necessary lengths and measured to ascertain exactly the cubic contents and rate of growth. There was a "surround" to the experimental plot itself from which trees could be cut corresponding as nearly as possible to the average tree in the sample plot, when it was not desirable to cut trees from the sample plot itself.

Proceeding, the Professor explained three methods of thinning adopted: light, medium and severe, according to what was considered the best density for growth. What remained after thinning were known as the elite trees, which were expected to remain as a permanent crop, and as the thinnings were removed these were measured. Referring to the plot under review, the first thinning was made in 1921, when the crop was twenty-one years' old. The volume per acre under bark was found to be 2,600 cubic feet. After 415 trees (giving 3,160 cubic feet) had been thinned out, 2,600 were left on the ground. The next revision was made in 1926, when the plantation was twenty-six years' old. The volume per acre under bark was then found to be 3,796 cubic feet, and the thinning made of 145 trees gave a volume of 573 cubic feet. There was thus a matter of 1,100 cubic feet increase in volume on the quarter-acre in five years. The value of these plots, contended Professor Borthwick, was quite evident. They showed what was obtainable under certain soils and climatic conditions from various species of trees under a certain density of crop, and as figures accumulated they would have a complete history of how trees of different species might be expected to grow in different soils and climates and what would be the yield of timber in cubic feet. The Forestry Commission had written to Colonel Ogston thanking him for the results of the measurements of the Douglas Fir sample plot, and stating that the increment during the five years' period had been highly satisfactory.

After an adjournment for refreshments, a meeting of the branch was held, Mr. John Michie, M.V.O., the President, in the chair. The business was formal, the chief feature being the admission of nine new members. Colonel Ogston thoughtfully set up a large marquee for the use of the visitors, and its shelter was greatly appreciated, the weather at times being very bad and the going hard and fatiguing even to the younger members. It was observed that the veterans of the party held their own with the best, for to the old woodmen the day's doings were but a repetition of what they had to undergo when carrying out the usual routine of a forester's day.

The party then proceeded past the ruins of Kildrummy Castle, built about 1250 by Bishop Gilbert de Mora, and associated with many of the crowned heads of Scotland, including the hapless Mary Queen of Scots. Dr. W. Douglas Simpson, University Librarian, Aberdeen, a noted authority on old castles and keeps of Scotland, delighted the company with a history of the castle, pointing out the principal features and paying warm tribute to Colonel Ogston for his laudable work in preserving to the best of his ability this fine old ruin.

Glenlaff Woods on the estate were then visited and keen interest was evinced in the belts of Larch which are making splendid progress at an altitude of 1,250 feet, and are now about forty years' old. Attention was directed to a measured area of Larch, statistics concerning which were supplied some time ago to the Forestry Commissioners. The average height of the trees is thirty-six feet, with a quarter-girth of four inches, and the number of stems per acres is 865. There was recorded a total volume of over-bark measurement of 1,420 cubic feet. To this had to be added thinnings made at the time of the measurement, which amounted to the removal of 135 stems per acre, representing a volume of sixty cubic feet. Especially notable

in this wood was the excellent depth of crown development and the remarkably cylindrical growth of the stems.

After tea, which Col. Ogston kindly provided, Mr. Michie moved a vote of thanks to Col. Ogston for inviting them to view his beautiful estate and for his hospitality. He said they had seen Douglas Fir in its very best state that day, and Larch the better of which they would scarcely find anywhere. Col. Ogston assured the company it had given him great pleasure to have them at Kildrummy, and to show them round. The well-known Scottish comedian, Sir Harry Lauder, who was fishing on the estate, joined the company at tea, and his drolleries and witticisms added not a little to the day's enjoyment.

ROYAL HORTICULTURAL OF IRELAND.

THE winter show, held by kind permission given by the late Earl of Iveagh, K.P., on the 19th and 20th inst., in the Covered Court, Earlsfort Terrace, Dublin, proved a bright and pleasing little function, a good display of autumn tinted foliage and berried subjects, with a fair sprinkling of decorative Chrysanthemums, breaking up the possible monotony of some eight hundred dishes of excellent samples of Apples and Pears, to which competition was chiefly confined.

For a collection of twelve dishes of Apples, distinct, eight cooking and four dessert varieties (four fruits to a dish ruled through the schedule), THE STEWART INSTITUTION, Palmerstown, Co. Dublin (Manager Mr. G. Bower), won first prize with clean, handsome specimens; second, T. SHERRARD, Esq. (gr. Mr. J. Synnot), Maryborough, Douglas, Co. Cork; third, Captain DALY (gr. Mr. J. Murtagh). In the class for twelve dishes of cooking sorts, distinct, LORD CLONCURRY (gr. Mr. W. Hall), Lyons, Co. Kildare; Captain DALY and THE SISTERS OF CHARITY (gr. Mr. J. Tully), Ravenswell, Bray, were thus placed, and in the class for six dishes, four cooking and two dessert, Sir F. W. MOORE (gr. Mr. P. Downes); O'NEILL DONNELLAN, Esq. (gr. Mr. D. Colohan), Windsor, Monkstown, and Miss K. DARLEY (gr. Mr. P. Mohan), excelled. Six dishes of cooking, distinct, found winners in Mrs. PONTET, St. Gatiens, Rathfarnham; Mrs. HAMILTON (gr. Mr. C. Pilgrim), Luttrellstown, Clonsilla, and Captain DALY.

Six dishes of dessert varieties were best shown by Mr. J. SHERRARD, Mrs. BERNARD (gr. Mr. J. Dawson), Belfield, Dublin, and Captain DALY. For the best four dishes of dessert varieties, distinct, Major KELLY (gr. Mr. J. McDermott), Montrose, Donnybrook; Mrs. STAPLETON (gr. Mr. P. Clinch), Wyvern, Killiney; and Mr. J. MORAN, Mt. Bellew, Co. Galway, were placed as named.

In the single dish class for Allington Pippin, represented by a score of competitors, Mrs. JOHN, Roseville, Bray; Captain HUTCHINSON (gr. Mr. T. Elliot), Belcamp, Raheny, and Madame FOTTELL (gr. Mr. W. Taylor), Richelieu, Sydney Parade, Dublin, excelled. Blenheim Pippin, with but few entries, found winners in Mr. T. SHERRARD and Captain DALY, while Charles Ross was best shown by LORD CLONCURRY; The Hon. A. E. GUINNESS (gr. Mr. W. Stevens), Glenmaroon, Co. Dublin, and Sir ARTHUR BALL (gr. Mr. W. Stewart), Carrickmines, Co. Dublin. Cox's Orange Pippin was exhibited a dozen times, and the STEWART INSTITUTION, Mr. T. SHERRARD and W. FITZGERALD Esq. (gr. Mr. J. O'Leary), Ovens House, Co. Cork, were thus placed in order of merit. Ellison's Orange does not appear to have become popular with Irish growers, and the three entries were from Mrs. STAPLETON, Miss K. DARLEY and Mr. ED. KELLY, Rosebank, Kingstown. For James Grieve, Miss K. DARLEY, Captain DALY and Madame FOTTELL outran a score of competitors, while King of the Pippins was best shown by Miss K. DARLEY, Miss ERCK (gr. Mr. E. McDonald), Sherrington, Shankill, Co. Dublin; and Mr. F. S. MYERSCOUGH (gr. Mr. M. Smith), Cionard, Dundrum. Gascoyne's Scarlet, to pass through a three-inch ring, was well shown

by Mr. WILFRED TIGHE (gr. Mr. W. Carson), Rosannagh, Ashford, Co. Wicklow; Captain DALY, and THE SISTERS OF CHARITY. LORD CLONCURRY, Sir ARTHUR BALL, and Mr. T. SHERRARD showed the best dishes of Rival. That Ribston Pippin still finds favour was evident by the entries, Major MEADE (gr. Mr. J. Carbury), Ballyhassig, Co. Cork; Mr. J. E. GEOGHEGAN (gr. Mr. W. Snow), Belcamp, Raheny, and Miss K. DARLEY excelling. For any kind of russet Mr. O'NEILL DONNELLAN was first, with Mrs. HAMILTON and Mr. J. E. GEOGHEGAN following, and for any other dessert variety not classed in the schedule, Mr. T. SHERRARD, Mrs. JOHN, and Mrs. STAPLETON were thus placed.

In the sixteen single dish classes for cooking varieties, Lord Derby, Lane's Prince Albert and Peasgood's Nonesuch, were outstanding in quality and quantity, the prize-winners being a repetition of those given in the dessert classes, and although but a couple of dishes of Rev. W. Wilks were seen, these, as contributed by Sir FREDERICK W. MOORE and Mr. J. E. GEOGHEGAN, were very attractive.

Pears comprised a dozen classes, including two for collections, for the latter of which the STEWART INSTITUTION and Mrs. MORE O'FERRALL (gr. Mr. J. Gilleran), Kildangan Castle, Monasterevan, Co. Kildare, were premier winners, with Mr. ED. D'OLIER (gr. Mr. J. Graham), Wingfield, Bray, and Mrs. HAMILTON next best. Single dishes were generally well shown and the samples of average merit. The outstanding features in this section were superb samples of Pitmaston Duchess, staged by Miss PRATT (gr. Mr. T. Jackson), the Red House, Ardee, Co. Louth.

There were good entries in the classes for standard bushel boxes of Apples packed for market, Mrs. HAGAN, Roseneath, Armagh, being placed first for dessert Apples, for a beautiful sample of fruits perfectly packed; Mr. J. McGRANE, Laureville, Tandragee, being second; and Mr. W. R. Ross, High Street, Lurgan, third; Mr. JAMES CRUMMIE, Artabracca, fourth. For the box of cooking kinds, Mr. McGRANE was first, Mr. CRUMMIE second, Mrs. HAGAN third, and Mr. Ross, fourth.

Vegetables were limited to two classes, viz., collections of twelve distinct and six distinct kinds, the first prize in the larger class being won by the Hon. A. E. GUINNESS, and Miss DARLEY (gr. Mr. J. Murphy), Violet Hill, Bray, with especially clean samples, notably the Celery; the smaller class finding winners in The Hon. GORDON CAMPBELL (gr. Mr. Cook), Clonard, Terenure; Major KELLY, and Madame FOTRELL. Classes for cut Chrysanthemums found little response, those for single varieties drawing blank, but this lack was well atoned for by a big bank of bright flowers, decorative kinds, staged by Mr. W. H. LEE, Powerscourt Gardens, Co. Wicklow, for which, combined with a good display of fruit and foliage he was awarded first prize and a Gold Medal.

For twelve vases of hardy berried or foliage plants, the MARQUIS OF HEADFORT (gr. Mr. W. E. Trevithick), was placed first, and Mrs. STEPHENSON, Cranford (gr. Mr. M. Buggle), second.

Silver-Gilt Medals were awarded respectively to the MARQUIS OF HEADFORT (President of the Society), to Mr. G. N. SMITH, Daisy Hill Nursery, Newry, Co. Down, and Messrs. CHAS. RAMSAY AND SON, Royal Nurseries, Ballsbridge, Dublin, for fine decorative stands of foliage, plants and berried subjects. Messrs. WATSON, of the Killiney Nurseries, Killiney, Co. Dublin, had a tastefully set up group of hardy shrubs, including novelties and choice subjects for which the nurseries are noted. For a collection of hardy Primulas, precociously flowering, Miss OSBORNE, The Farabond, Drogheda, was awarded a Silver Medal. A stand exhibiting Mortegg, and spraying appliances, contributed by Mr. D. M. WATSON, proved especially interesting to fruit growers attending the show from both far and near, a representative of the Mortegg firm being in attendance. The showiest display in the exhibition was a fine representative collection of Paeony-flowered Dahlias, beautifully set up in vases at the entrance to the building, contributed by a friend of the Society from a Dublin garden; this group witnessed to the open weather experienced in and around the Free State Capital.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

At the meeting held on Friday, October 21, the members of Committee present were Messrs. J. B. Adamson (in the chair), R. Ashworth, A. Burns, A. Coningsby, J. Evans, A. Keeling, D. Losh Thorpe, D. McLeod and H. Arthur (Secretary).

FIRST CLASS CERTIFICATE.

Brasso-Cattleya Muriel var. *Invincible*.—A large flower, seven inches across, of good shape and even colour, with deeply fringed lip and yellow throat.—From J. B. ADAMSON, Esq.

AWARD OF MERIT.

Cattleya Sylvia, *Bolholt* var.—From Captain W. HORRIDGE.

CULTURAL CERTIFICATES.

To Mr. A. CONINGSBY, for *Laelio-Cattleya Honoria* var. *The Shah*; and to Mr. J. HOWES, for *Cattleya Eleanore* var. *Distinction*.

GROUPS.

J. B. ADAMSON, Esq., Blackpool (gr. Mr. J. Howes), exhibited a group to which a large Silver-Gilt Medal was awarded. *Cattleyas* in variety, including *C. Sargon*, *C. Hassallii* alba var. *Hercules*, *C. Mantinii*, *C. Eleanore* var. *Distinction* and *C. amabile* alba were well shown, with *Brasso-Cattleya Muriel* var. *Invincible* and *B.-C. Joyce Hanmer*, and *Cypripediums* in variety. Mrs. BRUCE and Miss WRIGLEY, Bury (gr. Mr. A. Burns), were awarded a Large Silver Medal for a group that contained *Cypripedium Dreadnought*, *C. Pallas Athene*, *C. Kubele*, *C. Queen Alexandra*, *C. Maudiae coloratum*, *C. Farrieanum*, *C. insigne Sanderæ* and *C. Wrigleyanum*, besides *Odontoglossum grande*, *O. g. aureum*, and *Cymbidium erythrostylum*.

Captain W. HORRIDGE, Bury (gr. Mr. A. Coningsby), showed *Cattleya Sylvia*, *Bolholt* var. and *C. Mantinii nobilior*; *Laelio-Cattleya Honoria* var. *the Shah*, and *Oncidium Rogersii*. Messrs. KEELING AND SONS, Bradford, exhibited *Cypripedium Shogun*, *C. Goliath*, *C. St. Andre*, *C. Christopher* and *C. Actaeus*. Mr. JOHN EVANS, Colwyn Bay, staged *Cattleya Mrs. Medo* var. *Brilliant*, *Brasso-Cattleya Nestor*, and *Vanda caerulea*. Mr. D. McLEOD, Chorltoncum-Hardy, sent a good plant of *Cypripedium Reginald Young*.

ROYAL CALEDONIAN.

THE ordinary monthly meeting of this Society was held at 5, St. Andrew Square, Edinburgh, on October 4, Mr. W. J. Thomson, President, in the chair. Mr. J. S. Chisholm, senior lecturer at the Edinburgh and East of Scotland College of Agriculture, Edinburgh, gave a lecture on "The Pruning and Feeding of Fruit Trees."

The exhibits were: Roses, from Messrs. DICKSONS AND CO., Edinburgh; Dahlias, from Messrs. DOBBIE AND CO., LTD., Edinburgh; Apples, from the EDINBURGH AND EAST OF SCOTLAND COLLEGE OF AGRICULTURE; Apples, from Mr. GEORGE HOUSTON, St. Raphael's Home, Edinburgh; tuber with habit of Potato and colour of Beet, from Mr. JAMES KEDDIE, Davidsons Mains; Citron and Squash, from Mr. ALLAN S. BOLTON, Broxburn.

A Certificate of Merit was awarded to *Chrysanthemum Castlehill Beauty*, exhibited by Messrs. WM. MARSHALL AND CO., Castlehill Nursery, Ayr.

BECKENHAM HORTICULTURAL.

At the opening meeting of the winter session of the Beckenham Horticultural Society a paper entitled "Glasshouse Fumigation," was read by Mr. G. A. Piper. Calcium-cyanide, or hydrocyanic acid gas (which has no objectionable smell) was recommended, because most glasshouse insects can be effectively controlled by it. The general procedure is to apply the material along the greenhouse paths, using for the purpose a small thumb pot. Having applied

the fumigant, the glasshouse should be closed and locked for the night. Next morning it should be thoroughly aired and allowed to remain open before entering. When fumigation is to take place, a quiet night should be chosen, and the house and plants should be dry, as moisture on leaves will cause scorching. Temperature plays an important part, from 55° to 70° being advisable. The house should be measured to discover its cubic content so as to determine the correct quantity of material to use, the usual amount of calcium-cyanide being at the rate of a quarter-of-an-ounce per thousand cubic feet, as that is safe for the majority of plants, but Carnations and a few others will withstand a slightly stronger dosage.

NATIONAL SWEET PEA.

ANNUAL GENERAL MEETING.

OCTOBER 19.—There was a very good attendance of members of the above Society at the Annual General Meeting held in the Lecture Room of the Royal Horticultural Hall, Westminster.

Amongst the members present were Mr. J. M. Bridgeford, Mr. Robert Bolton, Mr. Hugh Dickson, Mr. George Ireland, Mr. Alfred Dawkins, Mr. Donald A. Blaxill, Mr. J. Stevenson, Mr. Ivan S. Dickson, Mr. W. S. T. Payne, Mr. C. H. Rundle, Mr. Donald Allan, Mr. A. C. Haslehurst, Rev. Frank Collins, Mr. H. J. Damerum, Mr. E. W. King, Mr. J. S. Brunton, Mr. E. H. Christy, Mr. Charles H. Curtis, Mr. D. W. Simmons and Mr. Fred T. Wheler.

During the first part of the proceedings the chair was taken by the retiring President, Mr. J. M. Bridgeford. As the Committee's Report and the Balance Sheet for 1927 were printed and circulated they were taken as read. The Report and Balance Sheet show a very satisfactory condition of affairs and that a good year's work had been done. Although, earlier in the season, the weather was none too favourable for Sweet Peas, a very successful show was held at the R.H.S. Hall, Westminster on July 7 and 8, and it is a healthy sign that the gate receipts were decidedly greater than usual. The Report also records that three Challenge Cups were won outright and, in winning the Sutton Cup, which was offered for eighteen bunches of distinct varieties of Sweet Peas, Sir RANDOLF BAKER, Bt. (gr. Mr. A. E. Usher), Ranston, Blandford, won the first prize in a Sutton Cup class for the tenth successive time.

In proposing the adoption of the Annual Report, the President, who is also the Honorary Treasurer, showed plainly that he takes his position seriously, and has a thorough grasp of the Society's finances, for he was able to make most interesting and valuable comparisons between the various items of income and expenditure of the year under review and former years. It appears that in nearly every instance the income items have increased and the expenditure items have decreased; a fact which speaks volumes for the management of this national society. The expenditure item which shows an increase is that on postages, and this, Mr. Bridgeford pointed out, was due to the Secretary's efforts to overcome a certain reluctance on the part of many members to pay their subscriptions early in the year. It would seem that the members have not yet fully realised that their Society's year ends on September 30 and not on December 31. Mr. Bridgeford appealed to the members to bear this in mind, to pay their subscriptions early and so save the Society expense and the Secretary extra work. During the year, £50 has been placed on deposit, and there remains a balance of over £10 in the current account.

The Chairman of the Floral Committee, Mr. Charles H. Curtis, read his report, which recorded that for the first time the Society's Novelty Trials of Sweet Peas had been grown both as disbudded plants and naturally. The Trials, which had been grown by Messrs. Sutton and Sons, at Reading, were very successful.

The membership of the Society continues to increase at a satisfactory rate, for eighty-five new members and eleven kindred societies were enrolled during the year.

Great satisfaction was expressed when the Henry Eckford Memorial Trustees announced that, thanks to the initiative of Mr. J. M. Bridgeford and to Mr. F. T. Wheler, sufficient money had been subscribed to ensure the memorial for all time. The choice of Mr. Alfred Watkins for this year's Gold Eckford Memorial Medal was very popular, and and the older members of the Society well remembered that, in its early days, there was no more zealous supporter than Mr. Alfred Watkins, and he has maintained his interest throughout the Society's existence. Mr. Watkins was President in 1906.

The new President of the Society is Mr. E. H. Christy of Greenways, Ingatstone, Essex. Mr. Christy is one of the best known amateur members of the National Sweet Pea Society. He was Chairman of the General Committee in 1915, and Chairman of the Floral Committee in 1917 and in 1918. There were two nominations for the office of Chairman of Committee, and on the poll Mr. Alfred Dawkins was elected. The Hon. Treasurer, Mr. J. M. Bridgeford; the Secretary, Mr. A. C. Bartlett; and the Hon. Auditors, Messrs. George Copley, Kay and Co., were all heartily thanked for their past services and re-elected unanimously.

The eligible members of the General Committee were re-elected, with the additions of Mr. F. T. Wheler, last year's Chairman of Committee; Mr. D. W. Simmons, of Messrs. Ryder and Sons; Mr. J. Randall, Leamington Spa; and Mr. Wm. Hufey, Tonbridge. As is usual, there was keen competition for positions on the Floral Committee, and the following members were elected by ballot.—Amateurs: Mr. E. H. Christy, Mr. C. H. Curtis, Mr. F. J. Rogers, Mr. A. E. Usher and Mr. F. T. Wheler. Trade: Mr. D. Allan, Mr. T. Bolton, Mr. G. H. Burt and Mr. C. H. Rundle.

At the close of the formal business the members were entertained to tea by the retiring President, Mr. J. M. Bridgeford, whose kindly and thoughtful hospitality was greatly appreciated.

ROYAL HORTICULTURAL.

THE following awards have been made to the undermentioned vegetables by the Council of the Royal Horticultural Society, after trial at Wisley.

Beet.

AWARDS OF MERIT.

INTERMEDIATE VARIETIES.—*Feltham Intermediate*, sent by Messrs. WATKINS AND SIMPSON; *Intermediate*, sent by Messrs. E. WEBB AND SONS.

HIGHLY COMMENDED.

ROUND VARIETIES.—*Detroit Dark Red* Re-selected and *Flat Egyptian*, both sent by Messrs. ZWAAN AND VAN DER MOLEN.

INTERMEDIATE VARIETIES.—*Intermediate*, sent by Messrs. CULLEN AND SON; *Nonpareil*, sent by Messrs. BARR AND SONS; *Obelisk*, sent by Mr. SPEED and Messrs. NUTTING AND SONS; (these four were considered to be alike); *Excelsior*, sent by Mr. CLUCAS.

COMMENDED.

ROUND VARIETIES.—*Early Model Globe*, sent by Messrs. ZWAAN AND VAN DER MOLEN; *Egyptian*, sent by Messrs. HURST AND SONS.

INTERMEDIATE VARIETIES.—*Intermediate*, sent by Messrs. J. CARTER AND CO.

Parsley.

AWARDS OF MERIT.

Perennial Moss Curled, sent by Messrs. WATKINS AND SIMPSON; *Champion Moss Curled*, sent by Messrs. NUTTING AND SONS; *Perfection Moss Curled*, sent by Messrs. BARR AND SONS; *Myatt's Garnishing*, sent by Messrs. R. VEITCH AND SON; *Exquisite Garnishing*, sent by Messrs. E. WEBB AND SONS; *Green Gem*, sent by Messrs. HURST AND SON; *Exhibition*, sent by Messrs. DOBBIE AND CO.; *Giant Curled*, sent by Messrs. E. WEBB AND SONS.

HIGHLY COMMENDED.

Champion Moss Curled, sent by Messrs. DOBBIE AND CO.; *Defiance Prize Moss Curled*, sent by Messrs. STORRIE AND STORRIE; *Mascotts Strain*, sent by Messrs. IRELAND AND HITCHCOCK; *Extra Curled*, sent by Messrs. DOBBIE AND CO.;

Extra Curled, sent by Mr. CLUCAS; *Supreme*, sent by Mr. BROWN; and *Fern Leaved*, sent by Messrs. WATKINS AND SIMPSON.

COMMENDED.

Dwarf Perfection, sent by Messrs. COOPER, TABER AND CO.; *Fine Curled* (Fijne Krul), sent by Messrs. ZAAIZAADVEREENIGING, Nunhem.

Obituary.

Lady Nall-Cain.—We deeply regret to learn of the death of Lady Nall-Cain, at Brocket Hall, Hatfield, on October 21. With Sir Charles Nall-Cain, Bt., she took a great interest in their garden at The Node, Welwyn, and more recently in the renovation and extension of the beautiful gardens at Brocket Hall.

Victor Straps.—We regret to announce the death, which occurred in the middle of October, at the age of seventy-one, of M. Victor Straps, a veteran of Belgian horticulture. Born at Lierneux in 1856, he early took up a horticultural career, and after working in various places, founded an establishment at Amercoeur, near Liège. He was a keen propagandist, as well as a hard worker, and attracted to the profession a considerable number of young men. He was one of the founders of the Royal Horticultural Union, and took an active and enduring interest in the Royal Horticultural Society, which was formed by the fusion of three older societies. He became a professor of the Liège Horticultural College when it was first founded, and only retired last year, accepting unwillingly the respite he had so well earned. As professor and lecturer he gained success and affection, and it would be difficult to calculate the numbers of his students who obtained distinctions at the Vilvorde examinations. During the war, when teaching work was more or less at a standstill, he was in charge of the re-victualling arrangements for the town of Liège, and threw himself heart and soul into the allotment movement, in which his sagacious and practical advice was heartily welcomed by all to whom it was offered. He was created by the Belgian Government Chevalier de l'Ordre de la Couronne, and also received the Special Agricultural Decoration of the First Class, besides having been made, by the French Government, Officier du Mérite Agricole. He leaves a widow and son, and will also be mourned by a very large circle of horticultural friends.

ANSWERS TO CORRESPONDENTS.

NAMES OF PLANTS.—*E. G.* 1, *Crassula lyco-podioides*; 2, *Sedum praealtum*; 3, *Kleinia repens*; 4, *Othonna crassifolia*; 5, *Mesembryanthemum Lehmannii*; 6, *Cotyledon adunca*; 7, *Mamillaria* sp.; 8, too scrappy for identification; 9 and 11, labels detached; the plant with articulated joints is *Kleinia articulata*, and the other, *Crassula Cooperii*; 10, *Mamillaria gracilis*; 12, *Aloe mitriformis* var. *albispina*; 13, probably *Salvia Grahamii*; 14, *Mesembryanthemum* sp.; 15, *Haworthia glabrata*; 16, *Ceropegia dichotoma*; 17, *Euphorbia mamillaris*; 18, *Chrysanthemum uliginosum*.—*E. Printed copies of the full Published Specifications may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at the uniform price of 1s. each.

Abstract Published.

A Machine for Catching Flea Beetles.—Patent No. 275,711.

The Flea Beetle which infests Turnips, as a rule, may be expeditiously cleared from a plot of these roots by a simple machine patented by Mr. J. H. Berry, of Gushmere Court, Selling, near Faversham, Kent. The trap which comprises a carriage mounted on wheels and adapted to be pushed by a handle, is provided with transverse rectangular frames supporting collectors coated with sticky material and provided with pendant fringes to disturb the insects during the progress of the machine. The frames are adjustably carried on axles supported by vertically adjustable members, and the wheel supports are also vertically adjustable. Screens arranged at the sides prevent the escape of the insects and also prevent dust reaching the sticky material.

MARKETS.

COVENT GARDEN, Tuesday, October 25th, 1927.

WE cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Tuesday by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market and the demand, and they may fluctuate, not only from day to day, but occasionally several times in the day.—EDS.

REMARKS. Supplies of cut blooms have been on the increase during the past week, especially amongst Chrysanthemums, and of these the coloured varieties exceed the present demand, both for disbudded blooms and spray-flowers in bunches; bunch white remains more firm in price. A good supply of Carnations is offered, but these fluctuate in price according to quality. Roses still retain their

good quality and prices were a trifle firmer to-day for the best quality blooms. Liliun longiflorum is the most plentiful of Lilies. Single Violets (Princess of Wales) are now arriving in good condition. Camellias and Gardenias meet a good demand. A few single Chrysanthemums are now on sale, mostly disbudded blooms. Supplies of French flowers are now increasing almost daily, and at present they consist of Acacia (Mimosa), Parma Violets, and Paper White Narcissus. France is also sending pads of Ruscus, large-leaved Myrtle, French Fern, and Chilies and Solanums, but these last are not much in demand at the present time.

REMARKS.—There seems to be a little more movement in the business just now, and most sections report improvement. English Apples meet a fairly good demand, although there is some competition from abroad. Cox's Orange Pippin is more plentiful and sells freely, although values are slightly lower for specimens in trays. Blenheim Pippin, Ribston Pippin and King of the Pippins are also popular, but Worcester Pearmain is now past its best. First grade Bramley's Seedling, Lane's Prince Albert and Newton Wonder are in demand at improved figures. Imported Apples have arrived on a large scale during the past week, and being in good condition are selling well. Mushrooms meet a steady demand; both cultivated and field produce is selling well. French salads are popular and sell quite well. Green vegetables are plentiful, the open weather being favourable to large quantities. French Beans from Guernsey are plentiful and cheap, in fact, prices are unduly low for the time of year, and no doubt a spell of really cold weather would help this section. The trade in old Potatoes is firm for best grade produce. Choice fruits, such as hothouse Grapes, Melons and Figs, meet a fair demand, but in the case of cold-house Grapes prices are comparatively low owing to the supplies of Dutch Grapes available. English Pears are scarce, the few arriving meeting a good demand. Blackberries continue somewhat scarce and prices are firm. Tomatos are plentiful; new-crop fruits sell fairly well, but old-crop fruits are selling badly, in addition to which there is competition with moderately

large supplies from Jersey. The condition of these latter is somewhat variable with a corresponding range of prices. Cucumbers are scarcer and selling slightly better.

GLASGOW.

Chrysanthemum supplies have been heavy and prices showed a further downward movement. Blanche de Poltoun was worth from 1s. 3d. to 1s. 6d. for 6's; September Glory, 1s. to 1s. 3d.; Almirante, 9d. to 1s.; Harvester, 8d. to 1s.; Delores and Sanctity, 8d. to 10d.; Framfield, White, 6d. to 8d.; Bronze and Pink Consul, 3s. to 3s. 6d. per dozen; Pink Delight, 2s. 6d. to 2s. 9d.; Alcalde, 1s. 6d. to 2s.; Phoenix and Betty Spark (sprays), 6d. to 8d.; and ordinary sprays, 2d. to 4d. Other flowers showed little movement either way. Carnations made 2s. 6d. to 3s. per dozen; pink Roses, 2s. 6d. to 3s.; white, 1s. 3d. to 2s.; and red, 1s. to 1s. 6d.; Lily-of-the-Valley, 2s. to 2s. 6d. per bunch; Liliun Harrissii, 2s. to 2s. 6d. and Calendula, 3d. to 4d.

The fruit market was exceptionally quiet and prices had an irregular tendency. First consignments of Jamaica Oranges (Blue Mountain brand) averaged 18s. 6d. per case; Grape Fruit was cheaper at 22s. to 24s. per case; York Imperial Apples, 35s. per barrel; MacIntosh Red, 16s. to 19s. per case; Jonathan, 15s.; Wealthy, 13s. to 16s.; Winter Nelis Pears, 12s. to 16s. per half-case; Beurre Hardy, 13s. 6d. to 15s.; home Grapes, 3s. 6d. per lb.; Dutch Muscats, 1s.; Italian Prunes, 10s. 6d.; Malaga Lemons, 300's, 38s.; Almeria Grapes, 25s. to 35s. per barrel; French Chestnuts, 4s. per stone.

Scotch Tomatos, 7d. to 10d. per lb.; Jersey, 1s. to 3s. per chip; Mushrooms, 3s. per lb.; Cucumbers, 5s. per dozen; Cauliflowers, 5s. 6d.; Lettuce, 1s. and Brussels Sprouts, 4s. 6d. per bag.

TRADE NOTES.

Most gardeners pay homage to "My Lady Nicotine" and those who are cigarette smokers may be pleased to know that the manufacturers of Player's Navy Cut Cigarettes have recently introduced a very tasteful packing. This takes the form of decorative tins, containing fifty and one hundred cigarettes, that will ornament any study or dinner-table.

PATENTS AND TRADE MARKS.—Readers requiring information and advice respecting Patents, Trade Marks and Designs, should apply to Messrs. Rayner and Co., Patent Agents, of 5, Chancery Lane, London, who will give free advice to readers mentioning *The Gardeners'*

GARDENING APPOINTMENTS.

Mr. H. Kingston, for the past twelve months gardener to G. C. DEAN, Esq., Sandal House, Warwick Road, Solihull, as gardener to W. E. BULLOCK, Esq., Lulworth, Warwick Avenue, Coventry. (Thanks for 2/- for R.G.O.F. Box.—EDS.).

Mr. W. Clarke, for the past five years and nine months gardener to E. R. BEAUSIRE, Esq., Hawkridge House, Hermitage, Newbury, as gardener to Admiral of the Fleet, Sir ARTHUR FANSHAW, Little Park, Brimpton, near Reading. (Thanks for 2/6 for R.G.O.F. Box.—EDS.).

Mr. F. E. Stokes, as gardener to Sir HENRY IMBERT FERRY, Bart., Strete Raleigh, Whimble, Exeter, Devon.

Mr. F. Pike, for the past ten years, gardener to the late W. HARTMANN, Esq., of Milburn, Esher, Surrey, as gardener to C. BURGOYNE, Esq., at Tangley Mere, Chilworth, near Guildford. (Thanks for 2/- for R.G.O.F. Box.—EDS.).

Mr. H. H. Hennessey, for the past three years gardener to G. COCHRANE, Esq., The Gardens, Athelhampton, Dorchester, Dorset, as gardener-bailiff to Mrs. LABAUCHER, The Gardens, Mapperton, Beamister, Dorset. (Thanks for 2/- for R.G.O.F. Box.—EDS.).

Mr. B. Allen, for the past five years gardener to J. R. HARGREAVES, Esq., Drinkstone Park, Bury St. Edmunds, as gardener to FIRST CONFERENCE ESTATE, LTD., High Leigh, Hoddesdon, Herts. (Thanks for 1/6 for R.G.O.F. Box.—EDS.).

Mr. J. Wareham, for the past sixteen years general foreman to L. CURRIE, Esq., Coombe Warren, Kingston-on-Thames, as gardener to Vice-Admiral Sir RICHARD WEBB, Elbridge, Windlesham, Surrey. (Thanks for 2/- for R.G.O.F. Box.—EDS.).

SCHEDULES RECEIVED.

HENFIELD CHRYSANTHEMUM SOCIETY.—Thirty-eighth annual show, to be held at the Assembly Rooms, on Thursday, November 3.—Secretary, Mr. J. M. Musson, Ivy Cottage, Henfield.

BUXTON AND DISTRICT CHRYSANTHEMUM SOCIETY.—Twenty-second annual show, to be held in the Pavilion Gardens, on Wednesday, November 16. Secretary, Mr. A. Nevil, Thornwood Cottage, Carlisle Road, Buxton.

SUPPLEMENT PLATE.

Chrysanthemums in Victoria Park.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 44.5.

ACTUAL TEMPERATURE—
The Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, November 2, 10 a.m. Bar. 30.4. Temp. 55°. Weather, Dull.

The Role of Observation in Scientific Discovery.

WE welcome the appearance of the current issue of the *Journal of the South-Eastern Agricultural College*, Wye, and are glad to know that with it there is good prospect that the annual series of publications—broken in 1914—will be restored. Among subjects of horticultural interest dealt with in the present issue is a note on the rate of degeneration of Potatoes. Varieties affected with Mosaic and other diseases of degeneration are being kept under observation, and, so far as records show at present, it is noteworthy that the progress of degeneration is less rapid than might be expected. The investigation is a very important one and will, we hope, be continued. According to current views, infected strains of Potatoes offer copious material through the agency of aphides for the yet further infection of other plants of the variety. If, therefore, the carriers are present in large numbers, deterioration should be very rapid. Evidently, therefore, close observation of the rate of degeneration may provide means of testing the complete validity of the aphid

hypothesis, or, alternatively, may enable fresh discoveries of modes of transmission of Mosaic disease from plant to plant. The experiment, indeed, may prove valuable in another direction also. For it would seem probable that if virus diseases of plants are to be stamped out it will only be done by breeding varieties immune, or at least, highly resistant, to these diseases. The best way of approach to this problem would appear to be by breeding from parents which have been shown to possess, at least in some measure, power of resistance, and it would seem that the existence of such varieties may be best discovered by such observations as are now being made at Wye. If memory serves, we already possess in Golden Wonder a variety which exhibits a certain definite, albeit limited, power of resistance to certain virus diseases. The note to which we have referred does not give a list of the seventeen varieties which are included in the trial, but, no doubt, the list will be included in a later publication. In the meantime, it might be worth while to make an especially careful series of observations on Golden Wonder, for although this Potato lacks qualities which make it a good commercial variety, it is, nevertheless, one which people of palate appreciate, and it might prove useful as a starting point for genetical experiment. It cannot, we think, be too strongly urged on modern researchers that observation is at least as powerful a means of advancing knowledge as is experiment. The older a naturalist grows the more he discovers his—and others'—abysmal ignorance of the life-histories and behaviour of plants. We are convinced that there will be a return to the old habits of naturalists, and that observation will be combined more and more with experimentation, and to the great benefit both of science and practice. It will, of course, be clear that the newer observation will be not a diffuse, but a directed observation; that is, the naturalist will set himself a problem, the solution of which is likely to be aided by sustained and close observation. Fashion holds its imperious sway no less in science than in society. Experimentation is in the modern scientific fashion—a very good and indeed essential fashion, too—but there is room among the ranks of scientific workers for trained and patient observers who will find out and tell us more about the ways of development and modes of behaviour of the living plant.

Chrysanthemums at Victoria Park.—Displays of Chrysanthemums in public parks and gardens are becoming increasingly popular year by year, and there is no doubt they are very greatly appreciated by the public, and particularly so in districts where there are comparatively few gardens. Such public displays are made in many public parks in London as well as in the provinces, but few excel in colour and beauty of arrangement the annual exhibition provided at Victoria Park in the north-east part of the metropolis. Our Supplementary Illustration represents a display in the conservatory at that large and useful open space.

Horticultural Club.—We learn that the Committee of the Horticultural Club has made arrangements with the St. Ermin's Hotel whereby members have the exclusive use of a room on Monday, Tuesday and Wednesday of each week, as from November 14, 1927. The St. Ermin's Hotel is close to the old headquarters, the Hotel Windsor, within easy distance of the Royal Horticultural Society's Hall, and near St. James' Park station. The proprietors of the hotel are willing to allow members the full use of the lounge and other facilities of the hotel during the whole of the week, but the

Club Room will only be available on the days stated. The hotel offers sleeping accommodation for country members, and there is a restaurant where meals may be obtained.

Unwanted Flowers.—Influenced by the much discussed remarks of Sir William Lawrence at the recent Autumn Show of the Royal Horticultural Society, at the Holland Park Hall, the Editor of *The Observer* arranged that one of his weekly competitions should be to discover the half-dozen flowers which his readers considered could most readily be dispensed with from the garden. On Sunday of last week the list, as decided by the voting of the competitors, was published, and the six "Unwanted Flowers" are Calceolaria, Dahlia, Sunflower, Geranium, Marigold and Aster, in the order named. The next in order of unpopularity were Nasturtium, Petunia, Lobelia, Begonia, Hollyhock and Golden Rod. It would seem that there was a considerable diversity of opinion amongst the entrants for the competition as to the six flowers they apparently disliked most, for only one competitor named five out of the first six, and in this case the maligned Dahlia was omitted. The prize-winning list read, Petunia, Calceolaria, Aster, Geranium, Marigold, Sunflower.

History of the Tomato.—In *Die Gartenwelt* for October 21 is a short article giving the chief dates in the history of the Tomato from its first introduction into Europe. It is suggested that the plant was introduced to Italy about 1560 by an Italian botanist named Anguillara, and first described by a Swiss naturalist, Conrad Gessner, in 1561. Apparently the plant came by way of Spain and Portugal from America; Anguillara speaks of it as Pomil del Peru, while another current name for it was American Tumate, or Mexican Tumate, and yet another, Pomum Indum. Gessner gives some information about its cultivation, and cites growers of the ornamental plant (though it must then have been very scarce) in Nürnberg, Breslau, Torgau and Antwerp. After this, the Tomato seems to have spread quickly, and it was illustrated in 1850 in a herbal. One writer, Harder, called the plant "Portuguese Nightshade," a useful indication of the probable route of its introduction from the new world. In an old "Kreuterbuch" dated 1588, the statement is made that these "Apples" had now become common in the garden, and that in "Welschland" they were eaten with pepper, oil and vinegar. They appear to have been sometimes used as a specific, but right up to the beginning of the nineteenth century the general belief prevailed that they were poisonous.

Dr. Hill's Botanical Tour.—Dr. A. W. Hill, Director of the Royal Botanic Gardens, Kew, has started on a tour to Australia, New Zealand, Singapore and the Federated Malay States, and it is expected that the tour will last for five or six months. The visit to Australia is at the invitation of the Commonwealth Council for Industrial and Scientific Research, and we understand that the expenses incurred will be met by a grant made by the Empire Marketing Board. Dr. Hill will inspect the various research institutes, make a general study of the flora of the several countries he is to visit, and investigate and report upon the agricultural and forestry resources and the botanical institutions in each country.

Great International Horticultural Exhibition at Antwerp, 1930.—We learn that the Royal Agricultural and Horticultural Society of Antwerp is to organise at Antwerp on the occasion of the Centenary of Belgian Independence, a great International Horticultural Exhibition. The Society has associated with the Royal Horticultural and Botanic Society of Ghent, and with the Royal Horticultural Society of Brussels so as to obtain the support of these two powerful associations. These negotiations have resulted in perfect agreement, and Antwerp anticipates the valuable co-operation of Ghent and Brussels horticulturists, who have agreed to forego horticultural exhibitions of their own at the same time, except for a purely local Rose show in Ghent, which will be held in July,

1930, under the auspices of l'Avenir Horticole and Les Amis de la Rose. The Society is also negotiating with the Executive Committee of the International Maritime, Colonial and Flemish Art Exhibition, with the object of holding the International Horticultural Exhibition in the halls and gardens of the World's Fair. Antwerp will thus have in 1930 a horticultural exhibition which its promoters will make every effort to render worthy of the great fêtes which will take place in connection with the celebration of the centenary. If an agreement can be arrived at with the International Maritime and Art Exhibition, the splendour of the temporary horticultural exhibitions and the interest of the horticultural congresses will add greatly to the attractions of the World's Fair.

Bequests to Gardeners.—The late Mr. Ernest G. Mocatta, of Woburn Place, Addlestone, who died on October 1, and left estate valued at £352,996, bequeathed £100 to Mr. W. Holden, his gardener, and £250 to Mr. T. Stevenson, his former gardener.

Coventry's Noted Mulberry Tree.—We learn from the daily press that the fine old Mulberry tree at Coventry was blown down by the destructive storm which raged over the country last week-end. This Mulberry tree was reputed to be over five hundred years old and to have given shade under its ample branches to the monks of the old Coventry Priory. When that part of the monastery grounds in which the tree stood was sold to the Coventry Constitutional Club it was expressly stipulated that the tree should be neither destroyed nor removed.

Coburg Rose Show in 1929.—On the occasion of the opening of the autumn exhibition in Coburg, Germany, it was announced that the local gardening association would be celebrating its centenary in 1929, and that in that year, to mark the occasion, the German Rose Show would take place in the town. As, in the same season, the exhibition of the German Dahlia Society will also be held in Coburg, the town will have an excellent opportunity of making the year a festive one, as numbers of visitors will be attracted thither by the double event.

Lectures at the East Anglian Institute of Agriculture.—A programme of weekly lectures has been arranged by the Essex Agricultural Committee, to be given at the East Anglian Institute of Agriculture, Chelmsford, during the session 1927-28. Although many of the lectures are of purely agricultural interest, there are others of special interest to gardeners and market gardeners, notably those on "The Cultivation of the Potato," by Mr. J. C. Wallace, Principal, Agricultural Institute, Kirton, near Boston, on November 7; "Soil Cultivation," by Mr. J. R. Bond, County Agricultural Organiser for Derbyshire, on November 28; "The Growing of Black Currants," by Mr. R. G. Hatton, Director of the East Malling Horticultural and Research Station, Kent, on December 9; "The Cultivation of the Cricket-Bat Willow," by Mr. W. R. Day, Imperial Forestry Institute, Oxford, on February 6; and "The Cultivation of the Tomato," by Dr. W. F. Bewley, Director of the Horticultural Experiment and Research Station, Cheshunt, on February 24.

Legacy for the Royal Gardeners' Orphan Fund.—The Trustees of this national gardening charity have received a legacy of £50 from the executors of the late Mr. Thomas Manning, who died at Putney last June. As many of our older readers will remember, the late Mr. Manning was for many years manager to Messrs. James Veitch and Sons, at Chelsea, and a regular supporter of both gardening charities, and for many years an auditor of the Gardeners' Royal Benevolent Institution. We recorded Mr. Manning's death, in his ninety-fifth year, in *The Gardeners' Chronicle* of June 11, 1926.

Increased Exhibits of Cider and Perry.—It would appear that more attention is being paid to the making of cider and perry, for, at the forty-fourth annual show of the Brewers' and Allied Trades, which was opened at the Royal Agricultural Hall, Islington, last Saturday, there were two hundred-and-three exhibits of cider and perry—a great increase on last year.

Sandringham Gardens and Local Charities.—Our readers are probably aware that Their Majesties The King and Queen permit the Royal Gardens at Sandringham to be opened to the public on certain occasions at a small charge, the receipts being handed over to local charities. This year over £1,000 was received in sixpences from 42,000 people who visited the gardens, with the result that £500 has been sent to King's Lynn Hospital and £450 to Queen Alexandra's Memorial Fund.

Mr. G. F. Anderson.—The Earl of Balfour's Gardens at Whittingehame, Haddington, have been famous over a long period for the many interesting plants they contain, but their fame has been enhanced as a result of the skilful cultivation of Mr. G. F. Anderson, who has been in charge for about seventeen years. During this period Mr. Anderson has carried out many alterations and improvements at Whittingehame, and he has also been a very successful exhibitor of Grapes and other choice fruits, as well as flowers, at Edinburgh, Glasgow and Southport. In 1923 he won the *Glasgow Herald* trophy, offered for the best table of dessert fruits, and he has also won the Thomson Challenge

MR. G. F. ANDERSON.

Trophy for Grapes on two occasions at Edinburgh. On the occasion of the International Horticultural Exhibition held at Edinburgh in 1923, Mr. Anderson was awarded the Veitch Memorial Medal for twenty-four dishes of fruits, and the Hogg Medal for an exhibit of Apples. It was under his father that he had his first lessons in gardening, at Kings Meadows, Peebles, where he remained for four years. He gained further experience at Morton Hall, Liberton; Hirsell Gardens, Coldstream; and at Mauldslee Castle, Carlisle. Entering the latter establishment as journeyman, he soon became foreman, and remained there for five years, when he was appointed to the position he now holds.

Forthcoming German Horticultural Exhibitions.—For the year 1929, the town of Essen is planning a great horticultural exhibition to include all the Ruhr, and to make a fitting successor to the two great shows held in 1926 and 1927, in Dresden and Liegnitz, respectively. This exhibition, covering an area like the Ruhr, which is of so overwhelmingly industrial a character, will be of particular interest, as showing that even in a highly industrialised district the love of gardening and horticulture can be kept not only alive, but flourishing. The arrangements are chiefly in the hands of the Essen Parks Superintendent, Rudolf Korte; he will be assisted in the garden design and architectural details by Inspector Johannes Gabriel, who performed the same task for the Dresden

Exhibition in 1926. Weimar is to have a great exhibition in 1928, to celebrate more than one anniversary; in 1828, the Grand Duke Karl August died, and the gardening association in Weimar was founded, while in 1728 the Bellevvedere Schloss was built, and it is there that the exhibition, which is to include all Thuringia, is to be held. The show will consist of a permanent exhibition, to last from the beginning of July to the middle of September, of garden designs, pictures, photographs, etc., illustrative of Thuringian gardening and horticulture, also of plants and flowers in the grounds. Seasonal exhibitions will follow one another, beginning with Roses and ending with Dahlias, while after the closing of the main show, a further one of fruit will be held in October, arranged by the Thuringian Agricultural Society.

Dyckia sulphurea at the Royal Botanic Society's Gardens.—Good specimens of *Dyckia sulphurea* are now in flower on the mound of Cacti and Succulents in the Royal Botanic Society's conservatory at Regent's Park. During flowering, some of the leaves assume a vivid scarlet colour, which attracts attention to the pretty sulphur and pale blue inflorescences in the centre of the plant. *D. sulphurea* thrives well on a dry rock-work under glass, where its roots may run between the crevices that carry away excessive moisture. Considerably over fifty plants of this Montevidean species were in bloom during August and September, and one group is now carrying over eighteen heads of bloom.

Art Gallery at Ken Wood.—We learn that under the will of the late Lord Iveagh, the mansion at Ken Wood, the Hampstead estate which has been left to the public as announced in our issue of October 22 (p. 320), is to be converted into a public art gallery, for which purpose Lord Iveagh has bequeathed over sixty valuable pictures by artists which include Gainsborough, Reynolds, Rembrandt, Romney, Franz Hals, Landseer, Pater, Van Dyck, Raeburn and Turner, and provided an endowment fund.

Harrogate Chrysanthemum Show.—Owing to the lateness of the season, the Committee of the Harrogate and District Horticultural Association has altered the date of its Chrysanthemum show, from November 9 to November 26.

Flowers and Fruits for the Lord Mayor and Lady Mayoress of London.—In maintenance of an old custom, the Master of the Gardeners' Company, Sir John Young, recently paid a visit to the Mansion House, for the purpose of presenting flowers and fruits to the Lord Mayor and Lady Mayoress. Orchids, Dahlias, Chrysanthemums and Roses were the flowers presented, and choice vegetables accompanied the fruits.

Experiment Stations in Holland.—It was just fifty years ago, in the year 1877, that the first Agricultural Experiment Station was established at Groningen, in Holland, and there are at the present day four of these stations: at Groningen, Hoorn, Wageningen and Maastricht. The Groningen Institute is chiefly concerned with experiments as to the chemical and physical nature of the soil; that at Hoorn is given over to research in dairy produce and cow-keeping. These institutions require an adequate staff, besides a small number of highly trained and skilled scientific workers, all of which costs money. The results of their researches, however, are so valuable to Dutch agriculture and horticulture as a whole that the money is well spent. At Hoorn, the experiments made in the scientific feeding of cattle have resulted in an immense saving to farmers all over the country. The Maastricht and Wageningen Institutes are more in the nature of control, or testing, stations, and deal with fertilisers, cattle-feed and seeds. The fertilisers are mostly dealt with at Maastricht, the feeding stuffs and seeds in two different buildings at Wageningen. This specialisation has the advantage of enabling the various operations to be preformed in the most economical way, almost on factory lines. As showing the magnitude of the operations carried out, it may be mentioned that between June, 1926, and June, 1927, 1,362 kilogrammes of fertilisers were dealt with at Maastricht, at a cost, for personnel and material, of 117,034 guilders. As the fees paid, however, amounted

to nearly 140,000 guilders, it will be seen that this particular series of experiments was rather more than self-supporting. The work at the feeding-stuffs testing establishment at Wageningen is divided into two departments, chemical and microscopic. The first is carried on very much as is the work at Maastricht, the second calling for a more specialised and highly skilled staff, which makes the expenses very heavy. The cost of the feeding stuffs department is 40,000 guilders per annum, but the advantages gained by the information made available to the Dutch farmers are so obvious that they scarcely need stressing. Similar conditions prevail in regard to the seed-testing department, but here not only the farmers benefit, but also the exporters of seeds to foreign countries. Naturally, the work carried on at these four research institutes has grown enormously during the fifty years they have been in existence, and has had to be more and more specialised and departmentalised. It is not possible to measure in terms of finance the benefits which have accrued to Dutch agriculture and horticulture in general

show; Nottingham and Notts. "Gardeners' Chronicle" Seventy-five Years Ago.—*Education of Gardeners.*—Being more in the habit, by the humble routine of my professional duties, of assisting others to publish their opinions in your columns, than to give "print" to my own, I must admit that I feel a great degree of diffidence in thus coming forward to ask your advice, and also to give my own practical experience upon the correct-

its real sense and meaning. All the world knows that Sir Joseph Paxton is a gardener; and not one would be presumptuous enough to challenge his "knowledge" or "education"; and in the small circle of my humble experience I may mention the names of such men as Mr. Fleming, Mr. Spencer, Mr. Fortune, Mr. Thompson, Mr. Glendinning, Mr. Cuthill, Mr. Ayres and a host of others, if necessary, to identify the same talented class; but I wish to know if, in the wide application of the term "gardener," I am to include all those jobbers at nurseries who publish their claims to the title on an ill-painted, and often ill-spelled, sign-board; which, suspended over their door, announces the fact that by them "gardens are laid out and kept in order by the day, month or year.—N.B. Carpets carefully beat, and porter's work done here." Because if these men are recognised as "gardeners," then do I dispute "Beta's" remarks altogether; for if I may judge by the penmanship and orthography of some of these "gardeners" when advertising for situations, I should say, that they were utter strangers to both "knowledge"

FIG. 160.—*TAXODIUM DISTICHUM* AT PAINS HILL.
Showing "knees"; see p. 363).

from the aid rendered, but it is not difficult to imagine that they must be immense, and that the Institutes must have contributed in no small measure to the high position enjoyed by Holland among the agricultural and dairy-farming countries of the world.

Appointments for the Ensuing Week.—

SUNDAY, NOVEMBER 6: Wakefield and North of England Tulip Society's meeting; Lyons Horticultural Exhibition and Fair (eight days). MONDAY, NOVEMBER 7: Harrogate and District Horticultural Association's meeting; Romsey Gardeners' Association's meeting; Birmingham Gardeners' Mutual Improvement Association's lecture. TUESDAY, NOVEMBER 8: Jersey Gardeners' Society's meeting. WEDNESDAY, NOVEMBER 9: Gloucestershire Root, Fruit and Grain Society's show; Oxfordshire Horticultural Society's show (two days); Wimbledon Gardeners' Society's show; Marlow Chrysanthemum Society's show; Kingston and Surbiton Chrysanthemum Society's show; Lancaster Horticultural Association's show. THURSDAY, NOVEMBER 10: Hitchin Chrysanthemum Society's show; Ipswich Gardeners' Association's show; Jersey Gardeners' Society's

ness of a paragraph which appears in your work, at p. 597, headed "Gardeners," wherein your correspondent "Beta" asserts, that "from information statistically and otherwise carefully collected, it is found that, as a body, gardeners are masters of more knowledge generally, and have received a better education, than most other professional classes of persons." Now, I am under the impression that if "Beta" had called upon me to assist him in collecting his "statistical" information, he would have somewhat modified his assertion; for, although I have no personal knowledge of gardeners as a class, still I consider that I am enabled to form an opinion as to the correctness and general applicability of "Beta's" remarks, from many things which come under my notice, as bearing upon the question, viz., "their having received a better education than most other professional classes of persons." I do not touch upon their "knowledge," because this is often, in a "professional" sense, found to exist in very great proportions where "education" is sadly deficient. Far be it from my intentions to dispute the assertion that gardeners are an educated class of persons; but I wish to ask you how far the term "gardener" may be carried in

and "education." To illustrate my case, may I lay a verbatim specimen before you, as it appeared from the "author's" own hand, before its correction by your humble servant. This specimen will give you a very fair idea of the class to which I allude. "As Gardener.—A highly respectable married man with one child 22 years of age who perfectly understands every branch of his profession. N.B.—Wife can look to dayre and is of sober and industrus habets. Direct, etc., etc." By this you will perceive that the situation is required for "the child 22 years of age who perfectly understands every branch of his profession," that "the wife is of sober and industrus habets," whilst not one word is said about the "highly respectable married man." In conclusion, I cannot confine my critical observations to the humble journeyman gardener, seeking a situation; for very many of the lists of choice plants, grown and furnished by respectable nurserymen, require much correction before they can appear in print as advertisements; to say nothing of the seedsmen's lists, which describe the names of articles they have to dispose of in the most outlandish and un-botanical style! *The Printers' Devil. Gard. Chron., November 6, 1852.*

The Week's Work.

THE ORCHID HOUSES.

By J. T. BARKER, Dunstable, Bedfordshire.

Dendrobium.—The deciduous section of this genus includes many plants which flower during the winter months. Such plants have completed their season's growth when the apical leaves of the pseudo-bulbs are fully developed; after this they need much drier and lighter conditions. Place them where they receive all the light possible, reducing the temperature gradually to a minimum of about 55° to 58°, and provide a drier atmosphere. The successful flowering of these Dendrobiums depends entirely on the proper resting and the consolidation of the growths, therefore every possible means should be taken to attain this end. Resting, does not mean the withholding of water, and leaving the plant to its own resources; as much skill is needed in resting a plant satisfactorily as there is in the production of growth, and even the best of growth will not produce the best flowers unless it is ripened satisfactorily. Backward plants, and those that have started to develop a secondary growth should be given every encouragement to complete their growth at the earliest possible date, and no attempt should be made to flower them.

Tall-growing Species.—*D. Brymerianum*, *D. Dalhousieanum*, *D. fimbriatum*, *D. moschatum*, and some of the hybrids of this section are usually late in completing their growths, therefore they should receive liberal treatment for the present. These evergreen species, with *D. densiflorum*, *D. Farmeri* and *D. thyrsoiflorum*, should be grown in the warmest division at all seasons. During the winter, when the temperature is lower, and the plants are at rest, infrequent waterings will suffice to keep the pseudo-bulbs plump and the roots healthy. Excessively dry conditions are as harmful as keeping the plants and the atmospheric conditions too moist, therefore great care is necessary to bring these plants successfully through the winter.

THE KITCHEN GARDEN.

By R. H. CROCKFORD, Gardener to THE RT. HON. LORD WAVERTREE, Horsley Hall, Gresford, N. Wales.

Seakale.—Where this very useful vegetable has been grown as advised, the plants will have fully developed, and for an early start a few of the strongest and best ripened crowns should be lifted carefully and left in the open for a short time in order to give them that check which enables them to start into growth much more freely when they are taken into the forcing house. Exposure is beneficial to the crowns but not to the roots. After the necessary check has been given, the thongs should be trimmed from the crowns and the latter placed in beds in the forcing house. For this early start a small quantity of fermenting material should be placed in the bins or beds to generate a little bottom heat, and on this the soil should be laid. Plant the crowns about three inches apart. If the soil is moist no water need be given for a few days, but the crowns should be sprayed daily with warm water. Maintain a temperature of about 55°, never allow the roots to suffer from the want of water, and succulent stems will soon appear.

Trenching.—Before commencing this important work, a rough plan should be made to show where the various crops will be planted or sown next season. For instance, where Onions, Peas, Beans, Cauliflowers and Potatoes are to be grown manure will be required, but all tap-rooted vegetables should be grown on ground manured for a previous crop. At least one-third of the garden should be trenched or double-dug. If the subsoil is poor it may be brought into good condition by bastard trenching for a season or two, deeply digging the bottom spit and (if it is heavy) mixing with it all the

sharp, gritty material possible, such as road scrapings, refuse from the garden fire, lime rubble, etc. Treated in this way, the whole may soon be brought into good condition. Deep digging is of the utmost importance where really first-class crops are expected, as it not only allows roots to enter more deeply into the ground, but enables the crops to resist drought during hot, dry weather; moreover, it allows surplus water to drain away more quickly, especially during the early season, and therefore the soil becomes warmer. Leave the soil surface as rough as possible; where the land is heavy, I recommend ridging.

Draining.—In a very wet season the need for drainage is obvious, therefore, where this operation is necessary no time should be lost in providing means for getting waterlogged soils into a better condition, as nothing will flourish in stagnant ground. The best method is the use of ordinary field drains. Commence at the lowest end of the plot, and lay the pipes so as to form channels to carry off superfluous water.

Outside Root Crops.—All root crops should now be lifted and stored in sand in the root house, with the exception of Parsnips and Jerusalem Artichokes which should be allowed to remain until the New Year.

HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD, Wrotham Park, Barnet, Middlesex.

Figs.—Success in the cultivation of Figs is only assured when the roots of the trees are restricted. All strong, sappy growths should be removed now, retaining only a moderate number of the best short and well-ripened growths. In favoured districts Figs are a success as bush trees, when planted sufficiently far apart to allow air and light to circulate freely amongst the branches. Where the climate is less favourable, Fig trees need wall protection, a south aspect being the best position for ripening the wood and fruits. When preparing a new border, the soil should consist of turfy loam, old broken bricks, lime rubble, burnt earth and some chalk, thoroughly mixed; at planting time the compost should be well rammed as this assists in the production of short-jointed, fruit-bearing wood. Planting may be done now, but as the plants are mostly grown in pots the roots should be thoroughly disentangled and spread out evenly. Brown Turkey is still one of the very best varieties.

Fruit Trees in the Kitchen Garden.—Where fruit trees are growing close to the vegetable quarters, their roots often enter a loose, rich soil, with the result that coarse, sappy growth is made. Such trees should be checked annually by digging a trench at a reasonable distance from the stems, lifting the roots so exposed and replanting them; when carrying out this operation do not prune the roots too severely, especially if the trees are large, but see that damaged ends are cut clean and the soil is made firm about them.

Pears.—All late Pears should be gathered and stored. Keep the sound fruits by themselves, and use damaged specimens for stewing, etc., before further decay sets in. Stored fruits should be examined frequently. Keep the atmosphere of the fruit room sweet.

PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NALL-CAIN, Brocket Hall, Hertfordshire.

Bulbous Plants.—Even where Hippeastrums were started into growth during late spring they should have completed their growth and will no longer require water at the roots. To ensure a thorough ripening of the bulbs they should be stood near the roof-glass, where they will be fully exposed to light and all available sunshine. The house in which they are stored should be kept airy and cool. Tubers of Begonias may be stored under the stages in a

cool house, placing each pot on its side so that the tubers are free from drip. Achimenes may be treated likewise, but should be wintered in a warm house.

Perpetual-flowering Carnations.—To secure an early batch of these ever-popular plants a good batch of cuttings should be inserted now. When choosing the cuttings select only those from healthy plants, otherwise the stock will be found to deteriorate. Certain growers insert the cuttings in clean sand, but I prefer a mixture of loam and sand, in which they will be found to root freely. Fill some small receptacles and dibble several cuttings in firmly near the edge of the pot; follow with a thorough watering, and afterwards place the pots or pans in a propagating frame, or in an ordinary box covered with glass. Some such protection is necessary to maintain an even humidity and induce quick rooting; if the cuttings are allowed to wilt or become dry it is almost impossible to obtain a successful "strike." Afford shade from the direct rays of the sun, and keep the temperature as near 55° as possible.

Sweet Peas.—The Sweet Pea is valuable for growing in pots for providing cut flowers during the early spring. Seeds should be sown now, placing three seeds in each three-inch pot filled with a somewhat sandy loam, and well-drained. It is preferable to germinate the seeds in gentle warmth, but immediately the seedlings appear through the surface they should be removed to a position near the roof-glass in a light, airy house, whence frost is only just excluded. When the young growths are about four inches high pinch out the tips; this will cause side-shoots to develop, and of these only two should be retained. Early in the New Year, when the days are lengthening, the plants should be moved into six-inch pots and, finally, transferred to those ten inches or twelve inches in diameter. The compost for the final potting should be enriched with a little decayed manure. Careful watering is necessary during the winter months, and a high temperature must not be permitted.

FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P., Ford Manor, Lingfield, Surrey.

Cucumbers.—Plants now in full bearing will require liberal feeding and good top-dressing, little and often, to keep them healthy and prolific. If the bottom heat is obtained from fermenting materials and hot-water pipes combined, and the drainage is good, Cucumber plants will enjoy more feeding at this season than many growers imagine, but the liquid manure must be weak and varied and 10° warmer than the bed. The material for top-dressing can hardly be too rough and, with a little rubble and charcoal added, should always be kept in a warm, dry corner ready for use. Keep the house clean and admit a constant supply of fresh air. Sulphur in any form will prevent the spread of mildew. Direct syringing having been discontinued, atmospheric moisture and a brisk bottom heat must be secured by renovation of fermenting material and damping available spaces. Avoid the slightest check by carefully dealing with laterals and old leaves; when the trellis is filled a leaf may be removed here and there, while space for the extension of the best laterals may be secured by pinching out weak growths.

Cherries.—The cool summer has been most favourable to trained trees under glass, especially where spider, earlier in the season, injured the leaves. The fullest amount of ventilation should be allowed, both night and day, but the best check to growth is shortening the roots. Watering will keep the roots sufficiently moist, but copious rains are far better, and where the roof lights can be removed, this should be done. Early trees in pots plunged in the open have had the benefit of cool nights, and provided the foliage is still hanging, the buds will now be safe. A mass of roots being essential to success,

water should be given in sufficient quantity to prevent the soil becoming dry. If the pots are well covered the need for watering will not be frequent, but when moisture is given it should penetrate to the crotches.

Pot Figs.—Any trees that remain outside should now be stored where they may be kept safe from frost. When the storing of pot Fig trees is finished the house cannot be kept too cool, unless the weather is exceptionally severe, but the roots of the trees must never become dry, as drought at the roots favours bud-dropping.

THE FLOWER GARDEN.

By JOHN COUTTS, Assistant Curator, Royal Botanic Gardens, Kew.

Dahlias.—When damaged by frost, Dahlia growths should be cut down, leaving only enough stem to permit the labels to be attached before the tubers are stored. Labelling is very important, especially where there are large collections of Dahlias. Although a large collection is very interesting, there is no doubt that Dahlias are most effective when grown in large beds or masses of one sort. A few of the very best varieties for filling large beds are The Prince, crimson; Pink Pearl; Persis, coral-rose; Ladybird, rosy-salmon; Dazzle, scarlet; Electron, yellow and orange-scarlet; Brentwood Yellow; Barlow's Bedder, crimson-scarlet; Dawn, yellow-bronze, with scarlet base; Tangerine, light orange, with scarlet base; Crimson Flag; Our Annie, shrimp-pink, with yellow base; Dobbie's Bedder, pale yellow; K. A. Victoria, still the best white bedding Dahlia; Moorkop, crimson-scarlet; and Lemur, with purple foliage and single, scarlet flowers. Some of the Collette varieties are also excellent for furnishing large beds. Among the dwarf Mignon varieties Coltness Gem, Abinger Gem, Dinkie, H. J. Jones and Peter Pan are all excellent for bedding purposes and may be relied on to make a good display; nearly all of these are ideal for furnishing a supply of cut flowers. A failing with many of our good Dahlias is the fact that they make little or no tuber—the fine variety Brentwood Yellow being a case in point—with the result that it is almost impossible to keep them over the winter when lifted; the only way to get over this difficulty is to grow a stock of pot roots the previous season.

Begonias.—Tuberous-rooted varieties lifted from the open and dried under cover, should be sorted over and stored away for the winter in a dry, frost-proof building.

Gladioli.—The corms should now be lifted, as many varieties are quickly affected by cold and damp; they should also be stored dry. Where large quantities of bulbous and tuberous-rooted plants are cultivated it is well worth while to construct a suitable bulb store. This need not be an expensive building; it should be well ventilated and some provision should be made for heating it. A structure of this kind may be used for storing more or less tender subjects during the winter, and for storing hardy bulbs, such as Hyacinths, Tulips and Narcissus, during the summer.

FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF AILSA, Culzean Castle, Maybole, Ayrshire.

Antholyza.—Members of this genus of bulbous plants bear a striking resemblance to Montbretias and are well worth growing in any herbaceous border where the latter are found to do well. They provide a useful supply of flowers, either for cutting or, what is of more importance to many, in the borders, where variety is required during late autumn. They may be successfully grown in the milder districts without any protection save that provided by their own decaying foliage, which should be left intact till spring; but in colder parts of the country, they should receive additional protection by placing Bracken or strawy manure around the clumps, or they may be lifted when the foliage has partially ripened, and stored in any frost-proof building until February or March. Like the Montbretias, they are readily

increased by dividing established clumps, and replanting in good soil in spring, but they do not spread like Montbretias. *Antholyza paniculata* is strong-growing, with erect and fairly broad foliage, above which the panicles of red flowers are well displayed during September and October, and easily reach a height of four feet under good cultivation. *A. crocosmioides* is a later kind, usually at its best at the end of October; it is also dwarfer than *A. paniculata*, grows about three feet high, and has large flowers of yellow and orange colouring.

Tubs and Vases.—Tubs and vases containing Fuchsias, Pelargoniums and other subjects used for the summer display should now be placed in a cool house from which frost is

of late-flowering shrubs, and even if they are occasionally cut back by frost during winter, they survive for many years without any protection and grow away again in spring.

Asparagus.—Asparagus growths are now sufficiently ripened to permit of their removal; cut them down to within six inches of the ground and, after removing all weeds, apply a liberal dressing of good manure to the beds. The method of growing Asparagus in single rows, from two-and-a-half to three feet apart, is a very convenient one, as the ground is more easily kept free from weeds by hoeing, and when cutting ceases in June the growths are easily secured to stakes and wires arranged for this purpose. The application of manure is also

FIG. 161.—ROSE NANETTE.
(see p. 362).

excluded; keep the soil rather dry during the dull, short days. Young, healthy plants may be retained for another season, but old or worn out plants should be thrown away and a batch of young stock grown on to take their place next season. Where a winter set of tubs containing Conifers and other hardy plants is used these should be placed in position immediately the others are removed. Fuchsias growing in pots should now be gradually dried off and stored for the winter, giving them only sufficient moisture to prevent shrivelling. Many Fuchsias may be successfully grown out-of-doors in mild districts, and although these may not reach the dimensions attained by *F. macrostemma* and its varieties, they form interesting and useful additions to any collection

carried out more conveniently, as it may be laid along both sides of the rows—after drawing back the soil—and covered up, leaving a ridge which protects the crowns and sheds heavy rains. All weeds of a perennial nature must be carefully forked out, as it is only by persistent efforts that they can be kept in subjection.

Planting.—Where the preparation of the sites is made in advance, as previously advised, the planting of Roses and fruit trees or bushes may be expeditiously carried out so soon as they arrive from the nursery, provided the ground is in good working order. The roots of all plants which have travelled some distance should be examined and, if dry, immersed in water, first trimming any bruised or broken rootlets.

INDOOR PLANTS.

DATURA CHLORANTHA, HOOK.

THIS handsome plant is the hardiest of the genus. It will continue to grow and flower in a low temperature, when *D. sanguinea* (reputedly the most hardy) is showing signs of distress. That is one reason why it is an ideal plant for a corridor, winter garden, or conservatory where frost is barely excluded. Since it is a gross feeder, it succeeds best when grown in a large tub, or planted out, and under such conditions it will make a stem six or eight feet in height and stout in proportion. When well-grown, the plant branches freely and forms an umbrella-like head, and the leaves, previously so much as nine inches in length and six inches in width, become smaller.

The pendent, trumpet-shaped flowers are borne in the axils of the leaves towards the points of the branchlets, and are nine inches long. The corolla has five points, gracefully recurved, and as it emerges from the green, sheath-like calyx it somewhat resembles it in colour, but when developed is of a beautiful soft, lemon-yellow shade.

This *Datura* is easily propagated from cuttings taken in August and placed in a temperature of 50° to 60°. When potted, the plants should be grown on rapidly, hardened off towards the end of April, and planted outside. Secure them to stout stakes and disbud occasionally until a standard has been formed, so that the branches and flowers are carried well above the line of sight, where they are seen to greater advantage. Once this has been accomplished the roots may be cut round in October, and the plants lifted later, either to be planted indoors in permanent positions, or housed during winter and used as specimens in tubs or large beds in the summer flower garden. Grown in either way, the striking appearance of *Datura chlorantha* will win admirers at once.

Some idea of its charms may be obtained by referring to the *Revue Horticole*, 1908, p. 392, or to the *Bot. Mag.*, 5,128, where the double form is depicted. *J. Comber*.

BEGONIA COCCINEA.

THERE are few plants which produce such an abundance of blossom as this species of *Begonia*; indeed, it may safely be regarded as perpetual-flowering, for at no time of the year is it entirely devoid of flowers. For covering the back wall of a conservatory, for draping a pillar, or for cultivation as a pot plant, it is equally useful. The flowers are produced in large, loose, pendant cymes, and are of a bright, scarlet-pink shade; the peduncles are also deeply tinted with the same colour. The large, smooth, shiny, green leaves are also attractive, and as they seem immune to insect and fungous pests they always keep remarkably clean.

If it is desired to grow the plant against a wall, or a pillar, it will be necessary to take out a cubic yard of the old soil, and replace it with good loam and leaf-mould, and to provide drainage at the bottom of the hole. After the soil has been allowed to settle, the young plant may be put in, and no further attention will be required, beyond tying in the shoots as they develop.

Growth will be rather slow at first, but so soon as new shoots spring from the base a remarkable development will take place. Three years ago I inserted a cutting of *Begonia coccinea*; the plant has now made two shoots, each of which is over twelve feet in length. In other words, they have reached the roof, and I have had to bend them laterally to give them room.

When a batch of plants is desired for the greenhouse stage, it will be necessary to select basal shoots for propagation. These will root readily at any time of the year in a bottom-heated propagating case. The resulting plants should be grown on in seven-inch pots, and by careful staking and liberal feeding with a complete fertiliser, bushy specimens about three feet in height will be obtained quickly. *G. F. Gardiner, Bristol Botanic Gardens.*

HARDY CYCLAMENS.

ALTHOUGH the hardy *Cyclamens* are very attractive and many of them flower at a time of the year when they are especially welcome, they do not appear to be so largely grown as their beauty and usefulness warrant. By making use of species that flower in spring and autumn, their attractiveness may be displayed over a considerable period of the year, and even when the flowers are over the marbled foliage which characterises some of the species is distinctly ornamental.

Hardy *Cyclamens* appear to thrive best in partial shade and prefer a gritty soil well supplied with humus. An essential factor is thorough drainage, and when the plants are established they should be left undisturbed, as they dislike being moved. They like lime, and when soil is being prepared for them a liberal amount of broken stone and mortar-rubble should be added to it.

C. coum is a spring-flowering species, its small, deep-red flowers appearing in February and March, contemporary with the leaves. *C. ibericum* also flowers in early spring, its bright rose-coloured flowers being rather larger than those of *C. coum*, but its season is about the same. *C. repandum* blooms somewhat later, its bright red flowers appearing from March until May. *C. neapolitanum* is a valuable autumn-flowering species, producing its dainty rose-pink flowers in abundance from August onwards; these are followed in October by the leaves, which are bright green with a handsome silver zone. There is also a white variety which is equally floriferous. *C. europaeum*, also an autumn-flowering variety, has bright red, sweetly-scented flowers, produced from August until October, contemporary with its beautifully marbled leaves. *A. P. C.*

BULB GARDEN.

TRICYRTIS.

MANY growers of hardy flowers have favourites which owe their attractions to a certain quaintness rather than to their beauty. Of such the *Tricyrtis* always appears to the writer as one. Long years ago my desire to know all hardy flowers well induced me to purchase two of the *Tricyrtises*, popularly known as Toad Lilies. *Tricyrtis hirta* was the first to enter my garden, but it seemed to resent our cool summers and tarried so long that frost destroyed the blooms before they could open. Next, *T. macropoda* was the object of desire and, as it is earlier, it did not fail to bloom before autumn had grown cold and dull. Once, in a hot summer, I think, *T. hirta* digned to bloom, but it was *T. macropoda* which was the stand-by of the race.

It is not possible to wax enthusiastic about these Toad Lilies. They are quaint things, formed after the fashion of a Lily, with wax-like blooms of dull pink, spotted and dotted with dull purple. They derive their interest from their singularity. They are not common in commerce—which one might well expect from their ineffectiveness. They should have a warm border and dryish soil. I cannot recommend them, except to those who appreciate the uncommon as distinct from the beautiful. *S. Arnott.*

PANCRACTIUMS.

THE reference on page 319, together with the plant illustrated in the supplement accompanying your issue of October 22, proves what a delightful and desirable bulbous plant is *Pancratium illyricum*. This species appears to have been in cultivation for upwards of three centuries. It may possibly be established in other gardens than those at Oxford, but I am inclined to believe that few obtain such fine results as Mr. W. G. Baker, the Curator.

During the early summer of 1919, I was shown a position where *P. illyricum* had been planted in good soil, at the base of a conservatory wall, in genial surroundings, where many tender and uncommon plants flourish. The owner of the garden is an enthusiastic and careful cultivator, but *P. illyricum* remained

quiescent, and ultimately succumbed. Its habitat is not difficult of access, but whether it abounds plentifully on hill, valley, or the littoral I am unprepared to say.

P. maritimum grows wild on the Asiatic shore of the Mediterranean, in firm, moist, saline sand.

During July, 1918, I saw it growing abundantly in clumps and drifts and flowering profusely on the Palestine coast. I had ample opportunity for examining the plants as we were out of the fighting line for a few days, and engaged in the healthful duty of bathing ourselves and horses in the sea. There may have been other drifts further along the strand, but I was unable to explore beyond a few hundred yards each way from this colony. I assumed it to be *P. maritimum*, owing to its proximity to the sea, and verified it afterwards.

As is the case with other charming plants, in course of time they become acclimatised, and when their requirements are understood and provided, they attract notice, thus encouraging other growers to cultivate them. *Frederick Gooch, Bossington Gardens, Houghton, Stockbridge.*

ROSE GARDEN.

ROSE NANETTE.

COMPARATIVELY few of the *Wichuraiana* Roses have fragrant flowers, therefore the variety *Nanette* is a pleasing exception to the general rule, as its pure white semi-double flowers (Fig. 161, p. 361) are sweetly scented. *Nanette* is a graceful Rose suitable for covering garden pergolas and arches. The individual blooms are about two inches wide and in the fully open flowers the margins of the petals are prettily waved, while the central cluster of golden stamens adds greatly to the beauty of the elegant flower clusters and enhances the purity of the whiteness of the blooms. *Rose Nanette* was shown well by Mr. Elisha J. Hicks at the provincial exhibition of the National Rose Society, held at Bath in 1925, and on that occasion it received a Certificate of Merit.

AUTUMN ROSES.

THE genial weather at the beginning of October resulted in a very welcome crop of late Roses, and in many instances there were more flowers on the bushes throughout that month than there were during the summer.

That old patriarch, *Gruss an Teplitz*, produced more blooms at this period than at any time earlier in the year, and this was also the case with *General MacArthur*, which still remains one of the best garden Roses.

The Tea and Hybrid Tea Roses usually provide a certain number of flowers towards the end of the season, and this year the Hybrid Perpetuals have, to some extent, followed their example. *Frau Karl Druschki* and another white variety, *Candeur Lyonnaise*, have borne many exceptionally large and perfect blooms. Others of the same class which have been almost as good are *Ulrich Brunner*, *General Jacqueminot*, *Hugh Dickson* and *Commandant Felix Faure*. These last two varieties have been pegged down, which may have accounted for the number of late blooms, but I should always include them in my garden on account of their sweet scent.

Mrs. Herbert Stevens has carried numbers of long-pointed blooms of shaded fawn, and heads the list of the Tea section for autumn flowering, closely followed by *Molly Sharman Crawford*, *Lady Roberts*, and that fine "button-hole Rose," *Lady Hillingdon*.

Caroline Testout is probably one of the finest Hybrid Tea Roses for general garden and park decoration, as it frequently flowers for three or four months, and its large, globular flowers make a splendid display. This year it has proved no exception to the general rule, and although many of the earlier blooms were spoilt by rain, the abundant crop of later flowers was ample recompense.

Other Roses which have given of their best to brighten the ever-shortening days of autumn are *Independence Day*, *Golden Emblem*, *Ophelia* and *Madame Edouard Herriot*. *R. K.*

CHRYSANTHEMUMS AT VICTORIA PARK, EAST LONDON.

TREES AND SHRUBS.

CLEMATIS REHDERIANA.

CONSIDERABLE confusion has arisen over the name of this distinct and attractive Clematis, the muddle originating in the identification of it in the first instance as *C. Buchaniana*, and, later, as *Clematis nutans*, both of which species are natives of the Himalayas, while the plant in question comes from Western China. It was introduced to France in 1898, and brought to this country a few years later, while in 1908 it was also introduced by Mr. E. H. Wilson as *C. nutans*.

C. Rehderiana (Fig. 162) is quite hardy, very free both in growth and the production of blooms, and is a useful subject for garlanding trellises, walls of buildings, trees or ornamental hedges. It is a deciduous climber, producing angular growths, twenty feet or more in length, which are clothed with pinnate leaves from six inches to nine inches long, consisting of five or nine leaflets. These leaflets, which are sometimes three-lobed and have coarsely-toothed margins, are broadly-ovate, heart-shaped at the base and pointed at the apex. They are dark green and slightly downy on the upper surface, the lower surface being lighter in colour and covered with silky down.

The flowers of *C. Rehderiana* are produced from late August until the end of October, in erect, nodding panicles from four inches to nine inches long, arising from the leaf-axils on the current season's growths. They are bell-shaped and strongly fragrant with the scent of Cowslips; the four sepals are about half-an-inch in length, have recurved points, and are cream-coloured, tinted with green at the base, and clothed on the outer surface with silky down.

Clematis Rehderiana is still a rare plant, but it is well worth growing on account of the lateness and fragrance of the blooms and the freedom with which it grows. A. G. F.

TAXODIUM DISTICHUM.

THIS is by no means a common tree, and one that is only met with as mature specimens in gardens and grounds where former owners took an interest in planting this and other rare Conifers. The tree is of fine pyramidal habit, a beautiful subject in spring, with its soft green, feathery foliage, and again in autumn, when the foliage is of a rich reddish-brown colour.

Taxodium distichum is quite hardy in the south and midlands, and will grow and make good specimens even in fairly dry situations, although the ideal position for it is close to a stream or pond. Being a native of swampy districts of the United States, it is only when planted in such positions here that the true character of the tree is developed. In such situations woody, oval protuberances spring from the roots and are known as "Cypress knees." These projections are at times two feet high, and good examples of this curious feature are illustrated in Fig. 160, p. 359, which represents a tree growing by the pond side in the grounds at Pains Hill, near Cobham, where the position suits its admirably.

This and the noble specimens of *Cedrus Libani* and other fine trees to be seen at Pains Hill makes one grateful to those who had the foresight to plant for posterity. R. F.

PARROTIA PERSICA.

CONSIDERING this species was introduced so long ago as 1848, it is surprising that it has not been more generally planted for the sake of its beautiful autumn leaf colouring. During the second week of October a small tree, some twenty-five feet to thirty feet in height, was gorgeous in its autumn colouring of glowing crimson, orange, yellow and green. Where autumn colour is desired, this small tree should be planted either singly or in groups. J. C.

LIGUSTRUM QUIHOUI.

ALTHOUGH the Ligustrums as a group can hardly be considered as highly decorative shrubs, this Privet should by no means be neglected in a well ordered shrub garden or border. It is deciduous, and forms a rounded bush of rather loose habit, producing slender growths with gracefully arched branches, from five to ten feet in height, the young branches being light grey in colour. The glossy, dark green leaves are

from one inch to two inches long, ovate or obovate, tapering at the base to a short stalk and usually rounded at the apex, the margins being slightly waved and entire. The plant is quite attractive in bloom, the white, fragrant flowers being produced in long, slender panicles during September and October.

Ligustrum Quihoui is a native of China, from which country it was introduced to France in 1862. A. G. F.

plant was discovered bearing one of its pink-coloured, bottle-brush spikes, and that towards the end of October last year. A close watch has been kept this season, and a few days ago a number of developing spikelets were discovered along with one fairly well developed. *Melaleuca hypericifolia* is not a showy plant as the flowers are produced from two- or three-year-old wood, and are screened from observation by the younger growth and foliage, but its

FIG. 162.—CLEMATIS REHDERIANA.

MELALEUCA HYPERICIFOLIA.

A FEW years ago a friend sent me some seeds of this plant, and as it was a stranger to me, the seeds were sown at once, and the resultant seedlings pricked out into small pots and eventually shifted into pots of larger size, as required; but as no sign of flowers appeared, several plants were planted out on a sheltered border about four years ago. They took kindly to their new quarters and soon developed into nice, bushy specimens with small, Hypericum-like foliage, which is doubly attractive because of the powerful Eucalyptus scent emitted when the leaves are bruised. Three years ago one

uncommon style of flowering makes it attractive to the collector of interesting plants, and it may well be that as the plants grow older the annual growths will not be so strong, and more and more flowers will be produced on the older wood.

In colder districts this native of Australia should receive the shelter of a wall, and in this position, with a judicious system of pruning its flowers might be better displayed; it would soon cover a fair space, as it grows rapidly in a young state, some of the plants here being nearly six feet high, and the small, evergreen, scented foliage is always attractive. A. T. Harrison, Culzean Castle Gardens.

ALPINE GARDEN.

EPILOBIUM OBCORDATUM.

A ROCK plant beloved by those who can give it a sunny ledge in light soil in a dryish part of our country, and which will bloom in August and September, has come to us from the Sierras of California. This is *Epilobium obcordatum*, one of the few really good alpine plants among the Willow Herbs, and, not only an attractive but a really showy plant when in bloom, and one which gives more than ordinary brightness to the rock garden in its season. Where it is happy, *E. obcordatum* forms a mass of trailing shoots, well clothed with leaves, which are rounded and of a delightful green, the shoots terminating in clusters of large and most pleasing flowers of a fine rose-pink. It is a plant which evidently detests our wet winters, but this is what we might expect of one from its native habitat, and I have lost it several times in wet seasons. Still, one does not like to be long without *E. obcordatum*, and I live in hope of finding for this *Epilobium* a more congenial home. A moraine or very stony slope might render it immune from the effects of our wet climate. It may be raised from seeds or increased by cuttings, and those who have such accommodation, may well keep a few young plants under glass to replace any which may be lost in the open.

GENTIANA FARRERI AND G. SINO-ORNATA.

PERHAPS I may be allowed to endorse Sir Herbert Maxwell's remarks upon these fine Gentians in your issue of October 8. *G. Farreri*, in my last garden, in a soil of medium loam with gravel mixed with it, grew only moderately well, but flowered fairly satisfactorily. Here in a better soil of rather heavy loam, it does not appear at all happy, and has not flowered this year. On the contrary, *G. sino-ornata* is evidently happy in similar soil, though rather more flourishing in one place where the loam has been lightened by the addition of some sand. I look upon it as one of the finest additions to the genus for many years. Its late blooming is a valuable point; on October 14, it was still in full flower. The colour is magnificent, although varying slightly in plants raised from seeds, but so far I have not seen an inferior or disappointing one. I am growing both *G. Farreri* and *G. sino-ornata* on rock work, near the base, and where they receive the morning sun and some in the afternoon as well.

VIOLA DECLINATA.

Viola declinata is the name applied to a very pleasing little Violet, but it is asserted with a good show of authority behind it that *V. Dubyana* is its true title. It is not too frequently met with anywhere, and in few nurseries does it appear to be stocked. Possibly this is due to the reputation it has for being short-lived, and this is a factor not to be overlooked. In most gardens it appears to be found desirable to raise it from seeds annually, but this is not always easy for the gardener, amateur or professional, when there are so many things to attend to. Possibly, we give it too generous diet, as it is a native of stony places or limestone moraines. Probably a more meagre fare would lengthen its life. It is worthy of some attention to secure a prolongation of life, as it is an attractive little plant of branching habit and gives us, from early May, and sometimes even earlier, many of its lovely little purple blooms. If seeds are not procurable—and I do not think they are—plants may be secured in pots from some nurseries.

FUNKIA SIEBOLDIANA.

THE late Mr. Peter Barr had a great admiration for the Funkias, or Plantain Lilies of Japan, and did a good deal to bring them into prominence, to the great benefit of British gardens. But the tide of popularity appears to have waned of late years, as shown by the fact that fewer varieties are offered by leading hardy plant nurserymen than there were even a few years

ago. Possibly we had too many forms, but there is no doubt that the Funkias, as a whole, lend themselves to many phases of gardening, and individually are excellent plants. One of the best and most striking is *Funkia Sieboldiana*, a bold plant with exceedingly handsome, ribbed glaucous foliage and beautiful, silvery-lilac flowers on stems rising to a height of two feet or more. It blooms in July. The variety *F. Sieboldiana major* is a very handsome one and should be secured if possible in preference to the other. In large rock gardens this Plantain Lily has been employed with good effect. It is also a splendid border plant, and I have seen beds filled with this and margined with a smaller species, creating a good feature in gardens. By the waterside, *F. Sieboldiana* looks extremely well. It likes good soil, and is increased by division.

PRIMULA MEGASEAEFOLIA.

MORE than twenty years have passed since I first grew *Primula megaseaeifolia*, which I was very pleased to have, but which proved a disappointing plant in most years, although the garden I had at that time was in a comparatively mild part of the country and close to the Solway. It is really a winter bloomer and, unless favoured by a mild climate and a kindly season, it looks unhappy, as its leaves seem to suffer from the cold. I grew it in quite a sheltered situation, in shade, and in a fairly moist part of the garden. It annually made an attempt to bloom but it was only in a few seasons that its bright, rose-magenta flowers managed to open well. It was appreciated when it did flower, as it helped to brighten up a corner in association with the Winter Aconite.

The name of *P. megaseaeifolia* is an apt one because of the form and appearance of the leaves, which greatly resemble those of some of its smaller Saxifrages of the Megasea section. The true role of *P. megaseaeifolia* is to be found by growing it in the alpine house, where its presence is most acceptable. It is a native of the Caucasus, where, I believe, it grows in shady ravines. *S. Arnott*.

FLORISTS' FLOWERS.

OLD BORDER CARNATIONS.

DESPITE vicissitudes and temporary lapses from grace, the border Carnation well maintains its place in the forefront of florists' flowers, and, indeed, in its later forms, as a decorative plant. It is ever interesting to delve into the early history of florists' flowers and observe the meticulous care with which they were grown, and the discrepancies between the cultural methods of to-day and yesterday. The same exactitude of perfection is not required to-day as during the first half of the nineteenth century, but every true gardener reveres the memory of the florists of those days. Their methodical and painstaking work has the foundation upon which has been reared the whole fabric of floriculture as we know it to-day.

In the *Transactions* of the Horticultural Society for 1833 is an article by a Mr. Wm. May, "On the Culture of the Carnation"; he recommends that in September the layers should be taken off the parent plants and potted "two in each forty-eight-sized pot" in a compost of half leaf-soil and half coarse pit sand approaching to grit. "When potted give a sufficient watering, and place them, exposed to the mid-day sun, in a frame filled with old tan so high that it will just admit the pot and plant to stand on the surface and not touch the glass." He advises that the frame be closed and shaded for a few days until the plants have recovered from potting; "then begin gradually to give air, and increase it till, in dry, warm weather, the lights may be entirely taken off; take care to close them down again before the evening dews fall, and preserve them at all times carefully from excess of wet, or mildew and canker will infest, if not destroy the plants." This mode of treatment is to be followed until November or December, "giving a little water to those that appear dry"; with the advent of

severe weather the lights are to be completely closed, "but when the weather changes and days lengthen; give air as before, until the latter end of March, when, for a few days before finally removing, give full air night and day."

The remainder of the paper deals with potting, and it is recommended that the plants be placed singly in thirty-sized pots, using for the purpose a soil composed of three-fifths decomposed leaf-soil, one-fifth coarse sand or grit, one-fifth road scrapings from a limestone-made road, or the subsoil or paring next the stone used for lime; "these ingredients should be well mixed and exposed to the frosts of winter, and be frequently turned, at the same time carefully picking out all worms, wireworms, etc." After describing the actual operations of potting, the writer commends the following practise: "Plunge the pots in the ground where they are intended to bloom, the rim being just covered. Before plunging, lay a small portion of soot in the place where each pot is to stand; this prevents the entry of worms, etc. This method is preferable to growing the plants, either in large pots to stand on the surface, or in the open ground. In the season of layering, place an inch thick of fine, sandy soil round each pot, in this the layers will readily strike root."

During the sixties and seventies of last century the ideas obtaining to-day had, in some part, been adopted; thus the following method for preparing a border or bed was promulgated:—The bed must be ridged up in autumn for exposure to the sweetening effects of winter weather and the extermination of insects; at the same time, a dressing of soot and lime, mixed [this is, of course, worthless advice, as both would thus be rendered innocuous] is to be applied and, if the soil is at all clayey, an addition of leaf-soil and sharp sand is recommended. March was the favoured month for planting, allowing the plants one foot space each way; further remarks refer to the "feeding," disbudding, and supporting of the plants.

Favourite Carnations of 1848 were Appleby's Prince of Wales, Brabbin's Squire Meynell, Barnard's Duke of Roxburgh, Hales's Prince Albert, Turner's William Penn, Ely's Prince of Wales, Brooke's Flora's Garland, Strong's Duke of York, Ely's Jenny Lind, Haines's Scarlet Defiance, Holliday's Thomas Hewlett and Elliott's Brilliant. Picotees obtaining favour were Matthews's Juno, Kirtland's Pride of the Village, Barringer's Miss Turner, Staniland's Eliza, May's Juliet, Burroughs' Duke of Wellington and Burroughs' Lady Smith.

During the seventies and eighties of last century a good collection would include, amongst others, the following:—Dodwell's A. D. Southgate, Gibbons's James Taylor, Hewitt's E. S. Dodwell, Dodwell's Alfred Hudson, Dodwell's G. F. Wilson, Fletcher's Clipper, Dodwell's Vivid, Turner's Lady Rosebery, Lemoine's Gloire de Nancy, Abercrombie's King of the Yellows, Dodwell's Friar Tuck, Taylor's Mayor of Nottingham, Dodwell's Tom Brown, Hooper's Duke of Grafton, Ward's Sarah Payne, Fletcher's Eccentric Jack, Elliot's Earl Stamford, Easom's Admiral Curzon, Dodwell's Mrs. Barlow and Woods' Rifleman.

A few years later and Mr. James Douglas, Mr. Martin Smith and others, by careful selection, hybridisation and devotion to this fine old flower, laid the foundation of the present race of Border Carnations. Now, and in the future, the objective must be the real old Clove perfume allied to flowers of good form and plants of fine constitution such as we already possess in a fine series of Border Cloves.

It would be interesting to know how many of the old Carnations mentioned above are still in cultivation; it is probable that some may be found in the byways of Britain, in old-world cottage gardens, and I sincerely hope that the response to the recent appeal for old-fashioned florists' flowers made by the John Innes Institute will be generous. Many of these flowers—Carnations, Auriculas, Pinks, Polyanthus, etc., provided the recreation of the workers in the great industrial centres, and perhaps in or near the great towns of the north and midlands, and from the old-world cottage gardens some of these treasures may yet be found. *Ralph E. Arnold*.

HARDY FLOWER BORDER.

PHACELIA VISCIDA.

ALTHOUGH the value of this plant is well-known to many country bee-keepers, it is a blue-flowered annual that has not received so much attention, as a garden plant, as its relatives *P. campanularia* and *P. Whitlavia*. The last-named is perhaps better known under the name of *Whitlavia grandiflora* or *W. gloxinoides*.

Phacelia viscida (Fig. 163) is a native of Southern California, and has been in cultivation in this country for very many years—nearly one hundred. It grows from twelve to twenty-four inches high, and is a freely-branching plant, the bases of the stems being somewhat hairy, while the upper parts are glandular. The leaves vary from one to three inches in breadth, and are of ovate-cordate shape, with toothed margins. The colour of the flowers varies, and it may be rich, deep blue—as in the most desirable strains—or blue-purple with a whitish eye. Flowers are borne freely and are individually about an inch in diameter.

As *Phacelia viscida*—also known as *Eutoca viscida* and *Eutoca viscosa*—is raised quite easily, if seeds are sown in the open, in April, it is an annual of special service where blue flowers are needed in beds or borders. C.

HELLEBORUS NIGER.

THE Christmas Rose, a native of Southern Europe, is noteworthy in having the largest flowers of any hardy plant that blooms early in the year. Introduced in 1596, and always a favourite, it has never attained the popularity of the Snowdrop, though both flower at the same season. Christmas Roses, although easily grown, are not always seen in good health, and no plant suffers more in appearance; the sparse, pale foliage, and short-stemmed flowers grovelling in the mud, are symptomatic of ill health. When well-grown, the flowers, protected by ample, green, leathery leaves, stand up boldly, on stalks six to nine inches in length, and, opening widely, display their dazzling whiteness, which gains by contrast with the pale green centre, and boss of lemon-coloured stamens.

Helleborus niger loves a rich, well cultivated soil, such as a plot that has been well manured for previous crops, and moist rather than dry. As to position, a border under a west or north-west wall suits it exactly; the addition of lime rubble is helpful; in fact, the finest plants I have ever seen were growing in stiff loam and chalk rubble, at the foot of the South Downs. In new ground, a sufficient depth of soil must be prepared by double digging, or, if the subsoil is very poor, removing part of it and substituting old hot-bed or well-decayed material from the refuse heap, working in half-a-wheelbarrow load of lime rubble to every four yards, and mixing the whole thoroughly before planting.

There was, at one time, considerable controversy as to the best season for dividing and replanting. The late Mr. E. H. Jenkins, a well-known herbaceous plant expert, contended that early autumn was alone suitable; others were equally sure that March and April were the best months. I have tried both seasons and should now adopt whichever suited my convenience. *Hellebores* seem to grow well under each condition, and may be multiplied by division at either season.

Hellebores will continue to grow and flower in the same station for many years, but are at their best during the third or fourth year. The clumps are then about twelve inches in diameter, and may be divided easily into quarters. Use two digging forks, setting them back to back in the middle, and prise the clump asunder. When planting, spread out the roots, and if the soil is stiff, a shovelful of fine soil around the roots will be beneficial; plant firmly. Unless seeds are required the flowers should be removed when faded; seeds ripen freely, and if sown so soon as ripe they germinate readily, but the flowers from seedlings are rarely better, and often not so good as the type.

Several named varieties have been placed on the market; *H. n. var. altifolius* is the best, as the blooms are very large, and beautifully flushed with rose. J. Comber.

CAMPANULA PUNCTATA.

A *CAMPANULA* which ought to be borne in mind by purchasers of hardy flowers is the North Asian *Campanula punctata*, a species about a foot high when in bloom, which gives us much pleasure in summer. It has rather oval, heart-shaped leaves on long stalks, and above these rise the stems, bearing several large, pendent bells of a pretty creamy-white shade, dotted in the interior with red spots. It thus presents two aspects for admiration. The first when seen with its long, handsome, drooping bells in the border, and the second, when these bells are examined inside, when the red spots on the creamy-white ground are most attractive. It is of running habit, but is not too obtrusive in this respect. It should have

as a rule, though it may produce one to three small ones on short branches occasionally. The head is purple, the leaves cottony beneath, and the whole plant without spines. A Mr. Penny seems to have been the first to discover it in this country, on the Ingleborough Fells of Yorkshire. John Gerard found it only once on the south side of Highgate. Although found in more than half the counties and vice-counties of Britain, it is confined chiefly to the mountains of the north. J. F.

HELENIUM WYNDLEY.

THE excellent review of the *Heleniums* by "R. F.," which appeared in *The Gardeners' Chronicle* of October 15 (pp. 304-5), leads me

FIG. 163.—PHACELIA VISCIDA.

a rather light and sandy soil, as in a heavier compost it does not succeed well, and may be lost in severe winters. Plants may be raised from seeds, or the runners may be removed with roots attached. It appears to prefer sun to shade, and flowers in summer. A.

CNICUS HETEROPHYLLUS.

It is not often that Thistles are planted in private gardens, but it does happen, however, and *C. eriophorus* is the most frequently admired and grown. I recently noted the Melancholy Thistle, as *Cnicus heterophyllus* is called, in the garden of Miss Wright, Kayhough, Kew. The only fault she has to find is that the root creeps and may send up a stem in the middle of something else. I cannot imagine why it should have been called Melancholy Thistle, unless because it has only a solitary head on the stem,

to pen a short note regarding a variety which I received from a Scottish nursery last spring, and which has flowered exceedingly well in one of my borders this autumn. It was named *H. Wyndley*, and may best be described as a form of *H. pumilum magnificum* of the same stature, but considerably deeper in colour than that valuable plant, and has flowers which, if anything, are larger than those of *H. pumilum magnificum* grown in the same border under precisely similar conditions. The colour is a rich orange, and the effect of a large plant is exceedingly fine. I have here practically a complete collection of the best of the named *Heleniums*, and of these I should place *Wyndley* in the first rank. I have been unable to trace the origin of *H. Wyndley*, and should be glad if any one could enlighten me. S. Arnott.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C. 2.

Editors and Publisher.—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the EDITORS. * The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Urgent Communications.—If sent by telegraph, these should be addressed "Gard. Chron., Rand; or by telephone to Gerrard, 1543.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Letters for Publication as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

MR. F. KINGDON WARD'S NINTH EXPEDITION IN ASIA.*

XVIII.—WE RETRACE OUR STEPS.

ARRIVED at my camp—which leaked like a sieve and stank of mould—I was met by a Lisu sent from Fort Hertz to my assistance. He brought my mail, with news of the general strike in England, and a bag of rupees, but no Rice; however, we procured a little food from the Tibetans. The men wanted to go straight

also, I intended to collect more specimens *en route*, and gave orders for going down in two chukkas, spending the first night at the lowest yak camp, at 9,000 feet.

All the snow had gone from the Seinghku valley now, and the flowers grew rank and raw.

FIG. 164.—GIANT RHEUM, 10 FT. HIGH; DI CHU VALLEY, 12,000–13,000 FT. ALT.

There were lusty species of *Pedicularis* everywhere, swaying stems of *Nomocharis pardanthina*, meadows of the sky-blue *Meconopsis*, its flowers growing flabby and floppy; pillars of the violet Poppy, looking rough, as the top

FIG. 165.—ABIES AND RHODODENDRON SCRUB IN THE MIST; UPPER SEINGH KU.

down to the village next day, but I refused, as I wanted a day in which to pack my specimens;

* The previous articles on Mr. Kingdon Ward's Ninth Expedition in Asia were published in our issues of August 14, 28, October 9 and November 20, 1926, and January 1, February 19, March 5, 19, April 9, 30, June 4, 18, July 30, August 20, September 10, October 1, and October 15, 1927.

blooms had come off; sheaves of *Primula sikkimensis*, and wide drifts of the butter-yellow *P. melanodonta*, the new 'Candelabra.' On the whole, there was not much that was new, only the old familiar things had been fattened up in the perpetual rain; but mention may be made of an ugly, yellow, tubular-flowered

Codonopsis, a few gross *Aconites*, and, in the high alpine region, a violet *Salvia*, one or two species of *Cremanthodium*, a tall, prickly, blue-flowered *Meconopsis*, and an occasional patch of sea-blue *Gentian*. At these heights August is the slack month—the spring, or rather, summer (for there is really no spring here), and the spring flowers were simply putting on weight; while the autumn flowers "laid low and said nuffin." Bearing this in mind, and remembering that unless Rice arrived from Fort Hertz pretty soon, we should be in a bad way, I decided to return to my base camp and clear things up, and then go down to the Nam Tamai for a week's rest; meanwhile, I hoped, the expected rations would arrive, and I could meet my mail and read the papers in the comparative comfort of the Hpalangdam hut, five marches below my base camp, and twelve marches from Fort Hertz.

On July 30 we left our alpine camp and marched down the valley to the yak camp, finding great difficulty in crossing the swollen stream. As for the main river; opposite the yak camp, the snow bridge over which we had passed so confidently seven weeks ago was now breached, and the river itself so tumid as to be almost unrecognisable. It was undermining the earth scree on the far bank with terrific force, and every few minutes a landslide of earth, stones and plants crashed into the flood, which faltered a moment before sweeping everything before it into limbo. It was fascinating to watch, almost terrifying; for the muffled roar of invisible boulders, hurled against each other beneath the water, shook the air.

The meadow was a marsh, the forest just above, a quag-bog; flowerless too. Only on the screes and streaming turf-tilts were there any flowers. The flame of the *Rhododendrons* flickered low snuffed out by the pitiless rain. 'Cherry Brandy' still flaunted a few of its illuminated corollas, and the quarantine-yellow, bush 'Campyloglaucum' (K.W. 7046) was well illustrated, being, indeed, little more than a post-impression of the 'Plumber' (K.W. 6,924). But high up on the scree face the dainty but frail *Primula siphonantha* shook out its tailed corolla like a pale violet comet. It recalls *P. Cawdoriana*, but is even more slight and slender, the scape not exceeding six inches in height, the rosette of leaves neat and compact, the flowers often reduced to a solitary one, but sometimes three or four. In a certain steep and stony gulley there were three or four hundred plants of *P. siphonantha*, growing on the rocks, on the earth banks, on the shingle beds, in the full, fighting blast of wind and sun and rain, where nothing else would grow; and that was the only place where I ever saw *P. siphonantha*, the latest recruit to the section 'Soldanelloides.'

Lower down on these gravelly slopes, where the contour afforded some slight relief, were dense thickets of *Rhododendron* and particularly *Vaccinium*, which in the autumn bore amazing, Grape-like bunches of blue berries; and in the bare patches, clumps of a grand *Hypericum* a yard through, crammed with inch-wide, brass-yellow flowers. These were real cushions, though the long, thread-like stems, with small, close-set, rather grey-green leaves, radiated in every direction, as though shot off from this blazing sun of flowers at the centre of the system. Some of the larger clumps may have been of considerable age; it makes a remarkably fine rock plant for poor soil (K.W. 7224).

July 30 was our last night in the alpine valley, and we suffered from a perfect plague of moths, which crowded into my tent, attracted by the light within and repulsed by the rain without. They were of all sizes, and bizarre colours, and they fluttered into my face and down my neck, and into the butter, and were an unmitigated nuisance, though I was able to make an interesting collection. The sandflies were even worse. We awoke in pouring rain, the mountains all around us wreathed in mist, with a fresh coat of snow spread thinly over the higher peaks; and prepared to march.

The stiff descent through the temperate forest was a liquid abomination, memorable chiefly for the discovery of *Rhododendron vaccinioides*, in flower for the first time. It has tiny, Box-like leaves, and wee, white flowers; and who,

looking at the straggling bunches of this epiphyte lolling from a tree trunk, would ever think of comparing it with the flamboyant bulks which to most of us, are *Rhododendrons*! It was originally collected in Sikkim by Hooker, who, however, did not see it in flower, nor is there any figure of it in his *Rhododendrons of the Sikkim Himalaya*. Until 1924, it had never been collected outside Sikkim, but that year I found it in Tibet, several hundred miles further east, and the chain was completed by discovering it in far Upper Burma in 1926, where several allied species are known.

Except for a few *Impatiens*, mostly with small flowers, *Mimulus*, a few *Orchids* (*Coelogyne*) and, down below, a *Hedychium* with salmon flowers, there was not much to collect; also most of one's attention was taken up with preserving one's life—literally. The river was terrific; in places the path was entirely washed away, and the greatest care was necessary, especially where we had to wade out into the swift current. The Bamboo forest was a gloomy bog, but no sooner did we step out into the open meadow of the Tibetan settlement than we became covered with leeches. The long grass was shaking with them, and they easily transferred themselves to us, so that presently the coolies were streaming with blood. In the middle of the afternoon we reached the village, and my hut, which was in a sad plight, the roof broken and leaking, the floor awash, and the rank grass peeping in between the logs. The river was coming down in great force, making a terrific din as boulders were rattled against each other like pebbles; on the previous day the bridge was carried away, and we were now cut off from the headman's house, but a temporary bridge was thrown across during the next twenty-four hours, thus securing communications. We stayed here ten days (August 1-10) partly to recuperate, partly in order to dry and pack my specimens, before going down to the Nam Tamai for a complete change. It rained steadily, and the infinite torment of leeches made leaving the hut a gruesome business; if I went for the shortest climb, I must set to work immediately on my return, picking off several dozen swelling, glutinous tubes!

The big-leafed *Begonia* on the river cliff was now coming into flower. The stems are lanky, crowned with large, close cymes of small, pink flowers, but the fine leaves are more attractive. Personally, I admire these wild Burmese *Begonias* much more than I do the monstrous aniline vamps of Peru. There were two small species of *Chirita*, also on the earth banks, *Anemone japonica* in the meadow, *Lysionotus*, with waxy, violet flowers, and scarlet *Aeschynanthus* in the trees, and other flowers; but the most interesting plants were trees and shrubs, such as grew along the fringes of the jungle. These included three species of *Ficus*, (1) a large, erect tree with prominently veined leaves; (2) a large climber; and (3) a dwarf creeper; a *Myrtus* with polished leaves and charming mauve flowers; *Rhododendron dendricola*, no longer epiphytic; *Berberis* in fruit; and several woody climbers, including *Honeysuckle*, *Vitis*, *Rubus* and two or three species of *Clematis*, besides species of the more tropical-looking *Apocynaceae*. The black-eyed, orange-faced *Dendrobium fimbriatum* was common, usually high up out of reach on the tallest trees, and there were a few other *Orchids*, including a gigantic and ungainly yellow saprophyte.

There must be hosts of new and interesting plants in this slaughter-house of mountain ridges and escarpments; but I realised now almost for the first time how inaccessible they are without prodigious preparation and prolonged effort. With the scanty and veiledly-mutinuous force under my command the thing was hopeless, even had the barrage of leeches and the impenetrable undergrowth been less formidable than it actually was. I therefore resolved to concentrate my efforts on the alpine valley, and to regard any work I did in the jungle as a pioneering effort which might attract some younger botanist to the sources of the Irrawaddy in the future.

For some days now I had been trying to get coolies, but the famine had laid its heavy hand

on the jungle, and it was not till the 10th that I managed to round up fifteen almost naked and starving savages. Next day we started down the valley, reaching the Nam Tamai confluence on the 12th. The most interesting plants met with in flower were the *Begonias*, with pink, white, yellow and orange-red flowers. This last was charming, and, moreover, the flowers were delightfully fragrant; another had bright chrome-yellow flowers. *Begonias* are most common on banks and rocks in the jungle between 4,000 and 6,000 feet altitude, and vary considerably in their foliage. The majority have white flowers. One epiphytic species occurs well above 6,000 feet, and of this and others I shall have more to say later. Altogether, I found about a dozen species.

away, but another was thrown across while we waited; not that I wanted to cross!

On the ridge I noticed the fine *Acer* with the long tails of reddening fruits looking as beautiful as ever; and down below I collected a coarse-leafed *Hydrangea* in flower, *Torenia*, various *Orchids*, *Zingiberaceae* and *Acanthaceae*.

A party of nomadic Nungs, driven from home by hunger, passed us, and our own coolies, having no food left, were dismissed at the confluence, where I decided to stay a few days. The Adung river was banging its way along pretty heartily, but had been fuller; it fell quite perceptibly during the next twenty-four hours. As for the long cane bridge over the Seinghku immediately above the confluence,

FIG. 166.—ALDER FOREST; (LOWER TEMPERATE AND RAIN FOREST), SEINGH KU VALLEY.

Impatiens is an immense genus, and in the jungle one finds species growing everywhere, with different species in almost every valley, and for every thousand feet of ascent. It is, perhaps, the most characteristic jungle undergrowth of the upper Irrawaddy, and the species are legion, though scarcely one is worthy of cultivation. Rankly-growing *Polygonums* are also numerous, social, and characteristic, indeed, down at the confluence, a climbing *Polygonum* seemed to have smothered the entire jungle, and in clearings it was sometimes the only visible plant.

At our first camp, in the meadow, we found the cane bridge over the Seinghku—which I had crossed several times in May—swept

that had suffered badly from the rains and looked even more insecure than ever.

Curiously enough, now that we had left the upper valley, the weather began to clear up, and we were threatened with a break in the rains; though whether the armistice was confined to the Nam Tamai, or extended right away up into the high mountains, it was impossible to say. Anyhow, August 12th was a day of almost continuous sunshine, a change one could little appreciate down here where the stifling heat and the solution of air and water which we had to breathe were alike pestilent. However, after being ninety days up the Seinghku it was pleasant to be in a roomy hut again, where one was fairly dry and there was space to turn round. F. Kingdon Ward.

TROPICAL VEGETATION AND SOME OF ITS USES TO MAN.

MR. W. HALES, Curator of the Chelsea Physic Garden, delivered a Chadwick Public Lecture on the above subject, in the Lecture Room, Royal Sanitary Institute, 90, Buckingham Palace Road, S.W., on Thursday, October 27. Sir William J. Collins presided.

Mr. Hales stated that the Trustees of the Chelsea Physic Garden granted him four months' leave of absence so that he might see tropical vegetation growing under native conditions, and the countries chosen for this purpose were Ceylon, The Straits Settlements, Malay and Java, as it was thought these would afford examples of a varied type of natural vegetation and also diversity of plantation crops.

The value of planting Casuarina trees along the banks of the Suez Canal to prevent the desert sand blowing into, and silting up the canal, was referred to, and slides were shown of the ancient water tanks at Aden, while the interesting rock vegetation of Aden was described.

Ceylon, which is noted for the tropical luxuriance of its vegetation, gave this impression in its capital of Colombo, with its masses of green foliage and the numerous flowering plants which abound in its many parks and gardens. Owing to the different elevations found in Ceylon, this island has varying temperatures and rainfalls in different districts, which make it possible to grow a wide range of crops. The area available for growing crops (excluding lakes and backwaters) is about 12,000,000 acres, but at the present time only about 4,000,000 acres are under cultivation. The acreage devoted to the chief crops is as follows:—Rice, 610,000 acres; other food grasses, 120,000; Coco Nuts, 750,000; Areca, Palmyra and Kitul Palms, 140,000; Tea, 398,000; Rubber, 184,000; Cinnamon, 45,000; Cardamons, 9,000; other spices, 10,000; Sugar, 20,000; Cocoa, 36,000; fruit-bearing trees, 250,000; Tobacco, 25,000; essential oils, 40,000; other cultivated grasses, 15,000; vegetable and garden produce, 350,000; and about 1,000,000 acres under natural pasture.

The train journey to Kandy was described, as also was the native cultivation of Rice and other products, and the beautiful mountain scenery. Mr. Hales referred to the work of the Royal Botanic Gardens, Peradeniya; early undertakings included the publication of a *Flora* of the colony, and the introduction and acclimatisation of useful plants, such as Cocoa, Cinchona, Rubber, Coffee and Vanilla. Examples of many of these early introductions are still to be seen in the gardens in fine old specimens of the Para Rubber, which were the first examples of this tree planted in Ceylon; Nutmegs one hundred years old and still bearing fruits, etc.

The work of the Agricultural Department and its capacity for dealing with problems which beset the planter, through its staff of scientific workers, and the facilities of its excellent laboratories and research stations, was touched upon. The research station is 650 acres in extent, with two branches—one at Heneratagoda, and the other at Hakgala—at different elevations, for comparison.

The Tea plantation of the New Peradeniya Tea Company was visited; this estate produced in 1923 no fewer than 1,000,000 lbs. of tea, a 1/150th of the total production for the island for that year. Owing to the drought of 1926, only about half that quantity would be reached in 1927. To keep the Tea plants dwarf and in vigorous growth they are cut down every fourth year to within a few inches of the ground. This pruning also helps to keep in check the stem-boring weevil which can only live in hard, woody stems. Rubber, Pepper and Cocoa are also grown as plantation crops on this estate.

The health resort at Nuwara Eilya, 6,200 feet above sea-level, was next visited, and on the way mile after mile of Tea gardens and Rubber plantations were passed. For some distance along the railway banks the Cuban Hemp is grown. Many vegetables are cultivated in the Governor's garden at Nuwara Eilya, and a Japanese S.S. Company has purchased a large

piece of land here for growing fresh vegetables for supplying their boats which call at the port of Colombo. On the hills about Nuwara Eilya large plants of *Rhododendron arboreum*, thirty feet high, are common. Large plantings have also been made of the Australian *Acacia melanoxylon*, which is now the chief firewood tree—so well has it naturalised.

Six miles south-east of Nuwara Eilya are the Hakgala Botanic Gardens, where many exotic trees are being tested for their value as timber trees or their economic products. Many fodder crops are also being experimented with to test their suitability for covering the barren "patuas" so that they may be used for feeding stock. Hakgala was founded as a hill station for growing Cinchona in 1861, and many of the older plantings of this tree are from seedlings raised here and afterwards distributed to planters. The garden now covers fifty-five out of five hundred acres which are available for development; and these fifty-five acres contain a good collection of economic and ornamental plants.

Penang is very beautiful, said Mr. Hales. This island, on the west coast of the Malay, is fifteen miles long and nine miles wide at its greatest width. The Betel Nut Palm is common, Coco Nut Palms are also much grown, and large areas are being devoted to various fruit plantations. The Waterfall Gardens have been famous for their beauty for many years, and also because of the large number of rare plants distributed from them to other gardens in various parts of the world. Once a bad malarial area, this has now been almost cleared by the valuable work done by the Anti-Malaria Board.

Taiping is a town lying on the Larut Valley mining field. Large areas of this valley were considered to have been exhausted and have been converted into pleasure gardens. Having the largest rainfall in the Malay, it is no wonder that epiphytes flourish here on the trunks and branches of trees in quantity. In fact, nearly every tree is a garden in itself. From Taiping Mr. Hales made a tour of inspection to the Mangrove swamps, which cover 200,000 acres on this side of the Malay, and are a source of some 580,000 dollars revenue to the Government from the sale of wood. An ascent of Taiping (Maxwell) Hill was made to see the hill flora and the health station at 3,600 feet, where many bungalows have been built for the use of Government servants for their short leaves. There is also a large vegetable garden here of some one hundred beds.

At Kuaka Kangsar, the Agricultural Department has a research station in which a number of varieties of Pomeleos are being tested, and not far away is a large area with pedigree Rice under trial. A week previous to my visit heavy rains had fallen in the Malay and caused enormous floods, which resulted in the river overflowing, and much devastation has been caused to Rice and other crops. In fact, this pedigree Rice area was so badly damaged that it would hardly be possible to collect seeds of some of the kinds for sowing again.

The next stage of the lecturer's journey was to Kuala Lumpur, which, since the Federation of the Malay States in 1896, has been developed into the central seat of Government. The public gardens and the lake, which are special features of Kuala Lumpur, cover some three hundred acres, and are being well planted with useful and ornamental plants. Very thorough are the precautionary measures waged here against that deadly enemy of man, the mosquito. Every likely breeding place is kept wonderfully clean and cement-lined channels cut everywhere carry off surplus water to the lake. At the top of the hill near this garden is the Department of Agriculture, which accommodates heads and staffs for dealing with economic botany, plant pathology, chemistry, entomology and mycology. The station itself is surrounded by several acres of trial ground, but so rapid has been the development of the Department that a much larger area has been provided at Serdang, about twelve miles out.

Six years ago this was pure jungle, but at the time of Mr. Hale's visit no fewer than six hundred acres had been cleared and were under cultivation with crops that may be of use to the planter

in the Malay. Over-production of the world's needs for Rubber may conceivably result, as was the case with Coffee some years ago. Hence the need for a more varied number of crops upon which the planter may rely. It is the work of this experimental station to test the suitability of such crops as may prove valuable for this purpose. A classified list of crops at present being tried is:—Food crops 19 acres; Fruits, 18; Beverages, 3; Fixed Oils and Fats, 11; Essential Oils, 10; Fibre Plants, 19; Drugs, 9; Spices, 5; Dye Stuffs, and Tannins, 5; Fodder Grasses, 18; Fodder Crops, 3; Cover Crops, 27; Shade Trees, 8; and Miscellaneous Crops, 10 acres.

Large areas were devoted to the plants from which Chaulmoogra oil is obtained, which is now used for curing leprosy. Excellent work has also been done in cross-pollinating the flowers of young Oil Palms, from which an increase of 400 per cent. of fruits is then obtained.

At Fraser's Hill, a Health Station which the Government has allotted for development as a residential place, there is an extremely interesting flora of an old world type. Two days were spent in seeing some of the forestry reserves in company with Dr. Foxworthy, the head of the Forestry Department. From careful costing records which have been kept, it is estimated that certain types of land when given up to forestry will yield a greater financial return than if they were cleared and planted with Rubber.

The lecturer briefly referred to the early introduction of Rubber into the Malay by Sir Hugh Low, who obtained seeds from Ceylon, where they had been sent from Kew—Kew having received them through Sir Henry Wickham from Para, in South America. He outlined the development and growth of the industry which has resulted in over-production. This has been met for the time by the Government's restrictions of output. Research work has been directed toward increasing the yield of Rubber per tree so as to reduce the cost of production, by various "bud grafting" experiments, and also through genetical methods which, of course, are slower.

Singapore, with its fine botanic garden, was also described, and the scientific work done there during the Directorship of Mr. H. N. Ridley, referred to.

The lecturer said that the agriculture of Java divided itself into two classes—the native cultivation of Rice, and the large-scale European cultivation of plantation crops like Rubber, Tea, Cinchona, Coffee, Tapioca, Cloves and Nutmegs. About twenty-three per cent. of the cultivated area of Java is under Rice. In 1923, no fewer than 3,300,000 tons were produced, and even this was not enough to feed the large native population. Of the exportable crops, Sugar is about ten per cent. of the world's production of Cane Sugar. This Sugar is grown chiefly on the alluvial plains of Central and East Java, on land leased from the native holders once in three years for the cultivation of a single crop. The Sugar, when growing, is fed with sulphate of ammonia, some of which is left in the soil when the land is returned to the natives, and in this way a larger yield of Rice is obtained. Tobacco is fed with phosphates, which also enrich the soil for the Rice which follows.

Cinchona is one of the interesting crops of Java, and ninety per cent. of the world's supply of this drug comes from Java. Large areas are also used for growing Tuberoses for the scent which is distilled from the flowers.

The Botanic Garden at Buitenzorg contains the richest collection of plants of any garden seen by the lecturer in the East. As a scientific institution it ranks next to Kew. Near it is the Food Department of the Dutch Government which is doing excellent work. One of the most fascinating sights in travelling through Java is the Rice plantations, and especially so through the Plain of Leles with its terraced Rice fields, flooded with water which glistens in the sun with every shade of green, from the light green of the Rice seed beds to the darker green of the young transplanted Rice, and the yet darker shade of the more fully developed plant.

RARE GARDEN WORMS.

IV.—THE WORM WITH A DOUBLE TAIL.

A REGULAR reader of this journal—a gardener—writes that, seeing the subject of worms treated in these columns he forwards a specimen found while digging. "I think it is a bit out of the ordinary, as it has two tails—a thing I have never seen before. It would be interesting to know if any one else has ever come across such a thing." The phenomenon is sufficiently uncommon to justify our placing it on our list of Rare Garden Worms, and devoting a little time to its study.

First let me describe the specimen, then we can consider its significance. We have here what the late Frank Buckland would describe as a Maiden Dew-worm, but which we shall speak of as an immature Long-worm (*Allolobophora longa*, Ude). The Long-worm is peculiarly liable to variation, and in this respect is strikingly different from the true Earthworm (*Lumbricus terrestris*) for which it is often mistaken. I have never found a true Earthworm with a double tail, while it is exactly thirty-five years since I described the first specimen of the forked Long-worm which came under my observation. It is a somewhat curious fact that though a good many cases are on record in English, American and Continental literature, there is rarely any proofs of such freaks reaching a marriageable age. This is determined by the girdle, and I personally have never seen a girdled specimen of a bifurcate worm. The significance of this will appear later.

The specimen submitted by our correspondent (Fig. 167) is about three-and-a-half inches in length, but when moving actively could stretch to four-and-a-half or five inches. The front portion contains seventy-seven rings or segments and is about two inches long. The tails are

FIG. 167.—VENTRAL ASPECT OF A BIFURCATE WORM; ALLOLOBOPHORA LONGA, UDE.

(Natural Size).

almost exactly alike and contain about ninety segments each, though they are only one-and-a-half inch in length. The reason is that the first fifteen segments are two or three times as wide as those in the tail, and contain most of the important organs and glands. There is considerable difference in the appearance of the tails in different specimens, which may possibly be due to difference of origin. Sometimes the secondary tail points forward, or juts out at right angles, as though it belonged to a second specimen which had been united to the original when they were lying head to tail as embryos in the cocoon. I gave an illustration of that type in these pages some years ago.* The one now under review, however, differs from this, in the fact that both tails point backwards, and could lie so close together that they would slip easily into the burrow when the worm went in head-foremost. A difficulty would arise when the creature wished to protrude the tail for the purpose of making a "cast" or ejecting the earth contained in its intestines.

So long ago as 1779, Dr. Bonnet drew attention to these peculiarities in worm-structure, and from that time until the present many cases have been placed on record. Specimens are to be found in the British or other museums, and among my collections recently presented to the University of Birmingham. It should be remarked in passing that worms sometimes have bifurcate heads as well as tails, and this fact leads us to enquire into the possible origin and significance of the phenomenon. Why have worms at times developed two heads or

forked tails? There are quite a number of possible answers to this question. I am content to mention a few of these, and leave others who have studied the subject carefully to add further suggestions.

To some students I have little doubt the first thought will be that we find here one further illustration of Nature's attempts to introduce a new type of worm. Nature is a great experimenter. She loses heavily in speculation—as do many other speculators—but now and again she scores, and then we get a valuable addition to our stock of living things. The student of variation and its bearing on the doctrine of evolution knows the value of such forms as these, and it cannot be too strongly affirmed that all departures from the normal in plant, insect, or animal should be carefully noted and if possible preserved. That new forms do arise from sports, freaks, abnormalities and variations everyone is aware, and we may therefore legitimately ask whether the worm of the twinned tail is one of these? It has been noted, however, that the specimens usually found have not reached maturity, and the inference is that worms with two tails are not specially well adapted for the battle of life.

Have we, then, a case of reversion? Is the second tail a recrudescence or a reminiscence of those times when worms usually had more than one tail? Quite possible. At Kew, Oxford, Regent's Park and elsewhere I have found a foreign worm in the Lily ponds whose tail is beset by growths or processes known as branchiae, which are, to all intents and purposes, secondary tails. Dr. Beddard, who first discovered the worm, named it *Branchiura*, or the worm with branchiae on the tail. These would be of great

service to a worm living in the water under certain conditions, and as our earthworms are descended from waterworms it is easy to see how, from time to time as in many groups of animals and plants, there may be a recrudescence of a lost feature.

Some of the peculiar forms of bifurcate tails cannot, however, be so explained, and we turn to a third theory. Worms lay their eggs in capsules or cocoons, and it is just possible that more than one embryo may survive. Suppose two embryos coalescing and forming Siamese twins! The head or the tail of the weaker might fail to survive, but the other portion might succeed in attaching itself permanently to the stronger form, and this would give us an imperfect twin, or a worm with two heads and one tail, or two tails and one head. This is in other groups a by no means uncommon type of abnormality, but may be regarded as a mere accident, without any physiological significance.

Some students of teratology, as this branch of biological science has been named, lay a good deal of stress on the effects of parasitism. Indeed, parasitology has thrown a flood of light on this kind of study during recent years, and as worms are peculiarly liable to be affected by a great variety of parasites it is not unreasonable to suppose that abnormal forms originate under their action. By stimulating, modifying, checking and otherwise altering the secretions, glands, cells and organs they may in many ways affect the structure of their hosts, and we cannot deny that a forked tail might originate in this way, though at present there are not many known cases which could be so explained.

This, however, leads us to two further possibilities. One often hears of proliferation, and if the cell-structure proliferates, or a segment starts two independent centres of growth, bifurcation might easily be the result. Now we usually find that the bifurcation roughly marks the beginning of the third portion of a worm's body. Measure up a worm and it will be found that the first section, from the head to the girdle, contains the organs of generation, the gizzard and a variety of glands. The second portion begins with the girdle which is concerned principally with the formation of the egg capsule or cocoon. But what of the hinder portion? Has it no use? Is it purely to enable the worm to crawl or hold on to its burrow? There is much evidence to show that the hinder portion is of importance in relation to alimentation. In some way it may have to do with the final preparation of the food or alimentary substances upon which the health and nourishing of the worm depends. Much remains to be learned on this subject but it is a suggestion worthy of consideration that bifurcation originates at a point in the worm's anatomy where change of function takes place, and that bifurcation may be due to this fact.

It will be seen that I have been using up the ideas which forty years of careful study have suggested, and that these are merely hypotheses. Students of any other forms of life can easily suggest from their own researches other possible lines of study, but I have kept to my own domain and my own observations because these are ultimately what investigators require. So we see what food for thought may be supplied by the discovery of such a thing as a worm with two tails, and I cannot but express the hope that readers will always note anything which strikes them as unusual, and afford specialists an opportunity of examining and reporting thereon. *Hilderic Friend, Solihull.*

MESEMBRYANTHEMUM.

(Continued from page 349).

KEY OF THE SPECIES.

11. LEAVES tapering to an obtuse point at the apex and the pairs more or less obliquely crossing one another, pellucid-dotted as viewed against the light; pedicel very stout, 9-10 lines long and 3 lines or more thick; stigmas 8-9. **5, cruciatum**

Leaves tapering to an obtuse or subacute apex, the pairs in two ranks or set slightly oblique to one another, very indistinctly pellucid-dotted, one of each pair slightly concave on the face; pedicel 9 lines long; corolla 2-2½ inches in diameter.

11, concavum

Leaves obliquely obtuse, broadly rounded or subtruncate at the apex, with or without a small point or mucro at the end of the upper edge, usually arranged in two ranks, not conspicuously pellucid-dotted.

12

12. The larger leaf of each pair shortly incurved-hooked or slightly hooded at the apex; pedicel 6-9 lines long; corolla 2 inches in diameter; petals acute; stigmas 10.

14, uncatum

The larger leaf of each pair not incurved-hooked at the apex, all leaves widely spreading, straight or more or less curved or bent down towards the ground, 1½-4 inches long, strap-shaped; pedicels 3-9 lines long; corolla 1½-2½ inches in diameter; petals acute; stigmas 9-10.

21, latum and vars.

Leaves not widely spreading, more or less directed forwards, with the pairs obliquely crossing one another, 1½-2 inches (or perhaps more) long, 8-12 lines broad, usually with parallel sides; pedicels 0-6 lines long; corolla 2½-3 inches in diameter, fragrant; petals somewhat acute or obtuse, entire; stigmas 8.

23, suave

Flowers sessile or subsessile. To the end of Key.

13. Leaves 3-6 lines broad at the

* *The Gardeners' Chronicle*, August 10, 1912, page 110.

- middle, but often broader at the base; leaf-pairs obliquely crossing one another. Leaves 6-18 lines broad at the middle.
14. Leaves with a pustule or pallid spot at their base on the upper side, gradually tapering from the base to an acute apex; petals obtuse and minutely toothed at the apex; stigmas 8. **7, Salmii**
- Leaves without a pustule or pallid spot at their base.
15. Leaves subterete and slightly flattened on the face or semiterete, 2-3 inches long, erect or ascending and curved; corolla 2-3 inches in diameter; petals very obtuse and notched at the apex; stigmas 7-8. **1, arrectum**
- Leaves semiterete, 3-4 inches long; corolla 3-4½ inches in diameter; petals united at the base for about a quarter-of-an-inch and up to 2 lines broad; stigmas 10. **12, angustum**
- Leaves tapering from the base or narrowing from above the middle to an acute or subobtuse apex, which is tipped with a short whitish or reddish point or mucro, and the pairs obliquely crossing one another, pellucid-dotted; keels of the calyx-lobes minutely ciliate; stigmas 8-10. **9, praepingue**
16. (From 13; leaves 6-18 lines broad at the middle; to end of Key). Leaves with a pustule or pallid spot at their base on the upper side; petals obtuse and minutely toothed at the apex.
- Leaves without a pustule or mark at their base on the upper side.
17. Leaves tapering from the base to an acute point, and the pairs more or less crossing one another; corolla 2½ inches in diameter; stigmas 8. **7, Salmii**
- Leaves strap-shaped, with parallel sides and an inch or more broad, arranged in two ranks; corolla 3-4 inches in diameter; stigmas 9. **18, grandiflorum**
18. Leaf-pairs obliquely crossing one another, 1½-3½ inches long and 5-9 lines broad, yellowish-green or light green, pellucid-dotted; stigmas 8-10.
- Leaves arranged more or less in two ranks and except in 8, *G. Marlothii*, grass-green and not pellucid-dotted.
19. Leaves tapering to the apex and all or some of them tipped with a short whitish or reddish point or mucro. **9, praepingue**
- Leaves not tapering to the apex nor tipped with a short point or mucro; stigmas 8-2. **13, taurinum**
- Leaves very obtuse or obliquely rounded at the apex, sometimes with a minute point at the end of the straight or slightly hooked upper edge; stigmas 6-8. **20, cornosum.**
20. Leaves upcurved and one or both of a pair distinctly hooked edgeways or by a slight twist at the apex (see also 22, *G. depressum*, in which the leaves are sometimes hooked at the tips); stigmas 8-9.
- Leaves obtuse or rounded and not or but slightly upcurved edgeways and not forming a distinct hook at the apex, but with or without a small point or mucro at the end of the upper edge; stigmas 7-8.
21. Leaves strongly upcurved-hooked edgeways at the apex and the large hook acute or sometimes obliquely truncate, 3-4½ inches long and 10-12 lines broad, the larger leaf of each pair with an impression of the smaller leaf upon it, forming a ridge along the margin at the middle part and an oblique ridge below the apex; corolla 3-3½ inches in diameter; petals obtuse and usually minutely toothed; stigmas 8. **19, Muirii**
- Leaves upcurved edgeways or by a slight twist and slightly hooked at the apex, 2½-4 inches long and 6-7 lines broad at the middle, directed forwards and more or less deflexed, without a ridge along the margin on the face; corolla 2½ inches in

diameter; petals obtusely pointed or notched at the apex; stigmas 9.

22. Leaves, in summer, opaque greyish-green or chalky green, prettily tinged with rosy or purplish when fully exposed to the sun, or becoming green in winter under cultivation in England, ¾-2½ inches long, 9-18 lines broad, subtruncate or broadly rounded at the apex.
- Leaves always grass-green or light green and more or less shining.
23. Leaves pellucid-dotted when held against the light, mostly 2-4 inches long and 8-10 lines broad at the middle, somewhat narrowing upwards to an obtuse and often obliquely mucronate apex; stigmas 7 (or 7-9). **8, Marlothii**
- Leaves not pellucid-dotted, ¾-3 inches long; corolla 2½-3½ inches in diameter; stigmas 6-10.
24. Leaves tongue-shaped, 14-18 lines broad, with the upper edge cartilaginous and very acute like the edge of a knife; surface-cells even, not raised; stigmas 10-11. **24, linguiforme**
- Leaves variable, 6-14 lines broad, not cartilaginous nor like a knife edge at the edges; surface with transverse rows of raised linear epidermal-cells as seen under a strong lens, stigmas 6-10.
25. Leaves very variable, ovate to tongue- or broadly strap-shaped, 6-14 lines broad; petals obtuse and minutely toothed at the apex; flowers very fragrant; stigmas 8-10; capsule with 8-10 gaping ridges on the top. **25, fragrans**
- Leaves strap-shaped, 8-13 lines broad, and of nearly equal breadth throughout.
26. Leaves very spreading, apparently 7-8 lines broad and not very thick, slightly curved upwards edgeways at the tips, and with a short point directed forwards at the apex of the upper edge; stigmas 10; capsule with 10 gaping ridges on the top; flowers opening only in bright sunshine. **22, depressum**
- Leaves directed forwards, 8-12 lines broad and 3-6 lines thick, apex variable; stigmas 8; flowers opening in sunless or sunny weather. **23, suave**
- Leaves 8-13 lines broad, thick and soft, very convex on the back, very obtusely rounded at the apex, not upcurved edgeways, and with or without a short point directed forwards on the upper edge at the apex; flower slightly scented; stigmas 6-8; capsule convex without any ridges on the top.

- (To be continued).

THE AGRICULTURAL HOLDINGS ACT, 1923.

THE most important Act of Parliament with which the market gardener is concerned is, I think it is agreed, the Agricultural Holdings Act of 1923. This Act consolidates the law on the subject and codifies the provisions of previous Acts and case decisions. And in addition it contains special provisions with regard to market gardens, allotments and cottage gardens.

The sections dealing with market gardens may be dealt with first. The definition of a market garden, according to the words of the Act, is: "a holding cultivated wholly or mainly for the purpose of the trade or business of market gardening," and a holding is defined as: "any parcel of land held by a tenant which is either wholly agricultural . . . or in whole or in part cultivated as a market garden, and which is not let to the tenant during his continuance in any office or employment held under the landlord." With regard to the expression "market gardening," there appears to be no definition of this term in the Act, but since it is

qualified somewhat by the words "trade or business," to entitle its occupier to enjoy the benefits of the Act the land must be cultivated on a commercial basis, and not merely as a pastime or for enjoyment without any consideration of profit, and, as a general rule, the cultivation of a garden, whatever its size, if the produce is only for one's own use and not wholly or mainly for sale, is not a market garden. The term, however, includes land used for producing fruit, flowers and vegetables, and orchards where the fruit is to be sold, but according to a decided case, it does not include agricultural land on which Potatoes, Peas, Celery or Carrots are grown in open fields. It may be noted that it has been decided by the Courts that land covered with glasshouses may be included in the term market garden.

So much for the definition of a market garden for the purposes of this Act. The gardens to which the special provisions of the Act apply, and the different regulations which govern them, may be divided into two distinct classes, in either of two ways. They can be divided as (1) those where the tenancy began before January 1, 1896, and those where it began on or after that date; or (2) those where the land was cultivated as a market garden with the knowledge and consent of the landlord, and those where it was cultivated as a market garden without his knowledge or consent.

Taking first those where it has been agreed by an agreement in writing made on or after January 1, 1896, that they should be let or treated as market gardens. These include those gardens the tenancy of which began before 1896 and were used as market gardens without the landlord's consent, but which since that date have been cultivated under an agreement in writing as market gardens, and all gardens the tenancy of which began on or after January 1, 1896, under an agreement that they should be cultivated as market gardens.

Therefore, if the tenancy of a market garden began before January 1, 1896, and was used as a market garden without the knowledge of the landlord, or if it began after that date, in order that the tenant may claim the special provisions provided by the Act, he must obtain an agreement in writing from his landlord whereby the latter consents to let the land as a market garden or allow it to be used as one.

The second class include those gardens which were let "under a contract of tenancy" current on January 1, 1896, and cultivated as market gardens with the knowledge of the landlord. As regards falling within this class, there is no necessity for the tenant to obtain any agreement in writing from his landlord before he can claim the special privileges applicable to market gardens. On showing that he was tenant of the land on January 1, 1896, and it was then used as a market garden with his landlord's knowledge, he will be entitled to these privileges.

The only difficulty here is the meaning of the term a "contract of tenancy." This is defined as meaning a "letting of or agreement for letting land for a term of years . . . or from year to year," so that the Act only applies to land let on a lease of yearly tenancy. *Harold Sharman.*

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, Ante pp. 131-137).
(Continued from p. 352).

ENGLAND, S.W.

CORNWALL.—The winter of 1926-7 was exceedingly mild, and even at 400 feet above sea-level we had no snow; during the latter part of April, the whole of May, and the first half of June we experienced delightful spring weather. Fruit trees bloomed profusely in ideal conditions, and at the time of writing it is doubtful whether we shall be able to do enough thinning to regulate the crops; a moderate yearly crop is much more acceptable than a "bumper" one at any time. I regret to have to record a very poor

crop of Strawberries for the fourth year in succession. Our plants seem to have degenerated and attempt to produce a moderate crop of fruit round about Christmas a quite useless attempt, of course; in the summer there is a dearth of flowers. *Harry Williams, Tolvean, Redruth.*

At one time Apples looked very promising but we experienced bitterly cold winds—reaching gale force at times—when the trees were in bloom, with the result that we have irregular crops. Royal Sovereign and King George Strawberries were a failure, but Madame Kooi, as usual, gave a good crop. All bush fruits bore excellent crops. Our fruit trees are making good growth and are cleaner than they have been for some years past. *A. E. Meredith, Cotehele Gardens, St. Dominick.*

DEVONSHIRE.—From the amount of strong, healthy blooms our trees carried, very heavy crops were anticipated, but owing to the late frosts alternating with hot sunshine, the fruits, although apparently set and growing fairly well, were adversely affected, and the trouble was aggravated by a very severe spring drought which caused many to fall. What promised to be a bumper crop was reduced to an average one of poor quality. *J. A. Stidston, Bishopsteignton, Teignmouth.*

—With the exception of Lord Grosvenor, Keswick Codlin and Irish Peach, Apples in these gardens have cropped much under the average. Orchards particularly failed to set fruits after a fair show of blossom. Pears are good (wall-grown), Marie Louise, Glou Morceau and Doyenné du Comice being our most reliable varieties. Small fruits have been plentiful and excellent in quality; Raspberries in particular, the Devon variety carrying a heavy crop of fine fruit on a northern aspect. Strawberries planted late in July or early August gave splendid results, but other beds had crops inferior both in quantity and quality. Where sufficient ground and runners are at command, closer planting of annual beds of Strawberries should be taken advantage of, more than is generally done. Our soil is a deep, holding loam, on a rocky or shingle formation, and grows excellent produce. *T. H. Bolton, Hartland Abbey Gardens, Hartland.*

SOMERSET.—Apples are an average crop; Cox's Orange Pippin, Blenheim Pippin, Warner's King and Bramley's Seedling carry full crops this year. Pear prospects were damaged by frosts during the flowering period; Plums also were damaged, but many sorts bore good crops, notably Early Rivers, Victoria, Pond's Seedling and Monarch. Damsons, too, carried good crops. Peaches and Nectarines cropped well, and the trees are clean and promising. Bush fruits were good, especially Raspberries and Black and Red Currants. Strawberries bore moderately; the only varieties that succeeded here were Royal Sovereign and Givon's Late Prolific. Our soil is a heavy, red loam, overlying stone. *James Glasheen, Hestercombe, Taunton.*

—Fruit crops generally were fairly good, most varieties of Plums bearing very heavily. Small fruits have also been plentiful, excepting Strawberries, which suffered from the early May frosts. Outdoor Peaches carried a fair crop of fruits of good quality. *William Mackay, The Gardens, Kingweston, Taunton.*

—Apples are a good average crop; Blenheim Pippin failed for several successive seasons but cropped well this year. Pears are scarce, as one expected after such an abundant crop last year. Plums were scarce. Peaches and Nectarines on walls were plentiful. Early Strawberries suffered badly from drought; late sorts benefited by the rains and gave some good fruits. Raspberries, Loganberries and Gooseberries were satisfactory, and Black Currants were plentiful. The worst thunderstorm in living memory passed over this district on July 12, when 2.98 inches of rain fell within two hours, accompanied by very large hailstones, with the result that much damage was done to ripe fruits, whilst Apples were badly bruised and soon showed signs of decay around the bruises. Nuts are plentiful. *J. Yandell, Halswell Park Gardens, Bridgwater.*

GLOUCESTERSHIRE.—The late frosts which played such havoc in some parts of the country affected us very little in Bristol West, but in Bristol East many early crops were badly damaged. A few young suckers of Loganberries were damaged, but Raspberries growing alongside escaped. Apple, Pear and Plum trees bore splendid blossoms, but owing to cold winds and low temperature, particularly at night, there was only a partial set. All small fruits carried heavy crops, but the fruits were rather small, owing to the prolonged drought. In a small orchard, where the trees are between sixty and one hundred years old, we have some splendid crops of Blenheim Pippin, Hawthornden, Gascoyne's Scarlet, Irish Peach and Ironside Apples. Blenheim Pippins are of splendid quality in alternate years. Our soil is heavy, yellow clay. *John Ettle, 201, Henleaze Road, Westbury-on-Trym, Bristol.*

—Raspberries, Red and Black Currants, Loganberries and Gooseberries carried exceptionally heavy crops in these gardens. Apples had to be thinned severely. Marie Louise, Conference, and Ne Plus Meuris Pears fruited well, and Charles Ernest, Durondeau, Buerré Diel are good, but trees of Josephine de Malines, Pitmaston Duchess, Souvenir de Congres and others, although protected with two thicknesses of nets, have not a fruit on them. *W. I. Mitchell, Westonbirt Gardens, Tetbury.*

—Our garden escaped the full severity of the late spring frosts, and in the fruit quarters Gooseberries and Pears were practically the only sufferers. The Apple crop is very good, the surprise being the comparative failure of Lord Derby. Varieties carrying especially good crops are James Grieve, Cox's Orange Pippin, Stirling Castle, Tower of Glamis, Lane's Prince Albert and Edward VII. This is not considered a good Plum district, but most trees carried a fair sprinkling, and some Gages heavy crops. Small fruits, particularly Raspberries and Black Currants, carried heavy crops of very fine fruits. Nearly all trees are in a clean and healthy state and have greatly benefited from the tar-oil spraying given during the past two seasons. Our soil is of a poor, cold, clayish nature, over limestone, but has been cultivated for quite two hundred years. *S. W. Dance, Williamstrip Gardens, Fairford.*

—Apples and Pears cropped well; I hear good reports of Apple crops in the neighbouring farms. Plums and Damsons bore heavy crops, and Peaches on walls cropped freely. Gooseberries, Black and Red Currants, Raspberries and Loganberries, all fruited splendidly. Strawberries have deteriorated, especially the variety Royal Sovereign. Rain was of daily occurrence from June 16 until July 6, and crops of all descriptions benefited thereby; rain was badly needed. *John Banting, Tretworth Gardens, Falfield.*

—But for the disastrous frost of the last night in April, fruit crops generally might have proved a record as there never was a better prospect. In places, where the frost was less severe, there are fair crops of Apples, Pears and Plums. Some varieties of Apples suffered more than others, notably Bramley's Seedling and Blenheim Pippin, while Worcester Pearmain and Lane's Prince Albert suffered less, but very late-flowering varieties, including Court Pendu Plat and New Bess Pool escaped and are bearing well. Strawberries were badly affected by the frost, and not only has the crop been small and poor in quality, but the plants look unhealthy. Gooseberries and Black Currants cropped well, but American mildew gave a lot of trouble. Where fruit trees were sprayed with a tar-oil wash there has been little injury from aphid and caterpillars, but the control of capsid bug, particularly in the Cheltenham area, presents a serious difficulty. *G. H. Hollingworth, Shire Hall, Gloucester.*

—Most varieties of Apples and Pears blossomed profusely, but the period of fertilisation was unduly prolonged through unsuitable weather, and most of the flowers dropped. A dry period followed, which prevented the fruits from swelling and after the welcome rains a large percentage of fruits remaining also dropped. The crown blossoms of Strawberries were damaged by frosts, and the remaining blooms

carried small fruits. Black Currants suffered badly from big budmite, especially Boskoop Giant. Red Currants and Gooseberries bore good crops. Peaches were badly infested with green aphid, this being unusually persistent in spite of several sprayings. *George H. Emmett, The Gardens, Lydney Park, Lydney.*

FRUIT GARDEN.

THE BEST DESSERT APPLES FOR CORDONS.

Most varieties of Apples lend themselves to restricted cultivation, but some are more amenable to cordon cultivation than others. In making a selection for this purpose, one should choose those varieties of close-spurred habit. I have also made it a practice to add to the planting compost for each tree about 1 lb. basic slag, $\frac{1}{2}$ lb. bone-meal, two ounces flowers of sulphur, and one ounce sulphate of iron. These materials are mixed with turned-out soil whilst planting proceeds. Firm planting is desirable.

The following Apples are excellent when grown as cordon-trained trees:—St. Everard, August-September; an early Apple of Cox's Orange Pippin flavour; yellow, striped with crimson; flesh yellow, crisp and juicy.

Maidstone Favourite, a real beauty and a heavy cropper; the attractive, flattish fruits are striped with carmine; this Apple is now coming on the market as a useful early variety.

Herring's Pippin, a variety of great beauty and recommended for dual purposes; it keeps well until the end of November; the fruits are rather large, round, and conical; colour greenish-yellow, with red flush and stripes; flesh pale yellow.

Heusgen's Golden Reinette, a late keeping Apple of high quality; fruits flat, russety and bright scarlet; flesh yellow, crisp and sugary; one of the very best late-keeping dessert Apples.

Golden Delicious is a new Apple that requires the protection of a wall or warm corner, as it has a somewhat delicate constitution. The fruits are large and golden-yellow; flesh yellow, very sugary and highly perfumed. This variety keeps until the end of January, when properly stored.

Claygate Pearmain is an old and excellent dessert Apple that should be in every garden. Fruit of medium size, dull russet with a faint crimson cheek; flesh tender, sugary, vinous and richly-flavoured. The fruits should remain a long time on the tree, otherwise they shrivel soon after they are gathered.

Ellison's Orange is hardier and more robust than Cox's Orange Pippin, and a variety that has a great future. The fruits are of medium size, similar in shape and colour to those of Cox's Orange Pippin; flesh tender, yellow, sugary, and of good flavour. I have seen some very fine, handsome fruits grown on cordon trees. The season of this excellent Apple is from the end of October to mid-November.

Easter Orange is a healthy grower and free cropper, the fruits keeping until June. The late-keeping quality of this Apple commends it to all growers. The fruits are of medium size, roundish-conical, deep golden-yellow, with flushes and stripes of dark brown-red. Flesh firm, yellow, sugary and of excellent flavour.

McIntosh Red is a brilliantly coloured Apple recently introduced from Ontario, and I recommend it for its free-cropping habit and handsome appearance.

Superb, a late dessert Apple of merit, has medium-sized fruits of flattish-round shape and golden-yellow colour, with red flush; flesh crisp, sweet and aromatic. This is a good cropper and undoubtedly an excellent variety. When properly stored, the fruits remain sound until quite late in the season.

St. Cecilia is a late Apple possessing something of the flavour of Cox's Orange Pippin. The fruits keep until January and February, and are of medium size, even, oval, golden-yellow, with crimson flushes and stripes.

Orleans Reinette is, I consider, one of the best six dessert Apples. The fruits are of medium size, flat, rich red and golden russet; flesh sweet and crisp; in use during January and February. *Pomona.*

HOME CORRESPONDENCE.

The R.H.S. Fruit Show.—Having sent in entries for the recent R.H.S. Fruit Show, I, like others, had my entry form returned for my employer's signature! Are gardeners now held in such poor respect by the Council of the Royal Horticultural Society that its members conceive it possible for a gardener to think of showing his employer's produce without first obtaining his employer's sanction to do so? Another matter has also arisen in regard to the recent fruit show: a week after the entries were sent, those who had entered found the postman had left an official letter from the Secretary of the R.H.S. stating that his Commissioner "will have the pleasure of calling upon you during the day"—rather short notice, should one have made other arrangements for the day. The reason of this visit, as stated, was to inspect the fruits entered; in my case the inspection was carried out in a thorough and methodical manner, but the whole business seems, again, to cast a doubt on the honesty of the exhibitor. It would be very interesting to have the opinions of other readers who were exhibitors. *Exhibitor.*

Fruit Thieves at Westminster.—I was one of the largest exhibitors at the Royal Horticultural Society's Fruit Show on October 11, and I can endorse every word written by your correspondent Mr. W. J. Penton (p. 351) in regard to the stealing of fruit. I lost about fifteen dishes altogether; my exhibits were in various parts of the hall and the two annexes, so that it was impossible for me to keep the whole set under observation. Being single-handed and fairly well-known, no doubt I was shadowed all the time; if I had intended exhibiting at other shows it would have been a very serious matter. The intrinsic value of the fruit is not serious, but to have the fruit stolen practically under one's eyes is intensely irritating, and steps should be taken by the Society to put an end to this state of affairs. The hall should be cleared and then only exhibitors and their assistants admitted. *J. A. Stidston.*

Soil Sterilisation.—Your article (p. 259) on Soil Sterilisation was most interesting to me, and I looked forward for some comment by certain of your correspondents. It recalls an experience I had when gardener at Normanton Park, Stamford. I made arrangements for sterilising all our potting soils and the results were surprising in a very short time. We potted half our French Beans (for forcing) in sterilised soil, and half in non-sterilised soil. We soon observed a marked difference, so much so, that when rearranging plants in the forcing house it was quite easy to pick out the sterilised set. The foliage of these was stronger and darker, and the crop of Beans was one hundred per cent. better than in non-sterilised compost. The chef informed me, too, that the Beans grown in sterilised soil were much the nicer when cooked. Unknown to me, my outside foreman coated one of the Mushroom beds in the Mushroom house with sterilised soil, and when the beds were in full bearing he called my attention to the two beds; the difference was striking; the bed coated with sterilised soil was in full bearing when the non-sterilised bed had not a Mushroom showing. These two examples prove conclusively that sterilised soil has a very stimulating effect on growth and development. We next tried sterilising the soil for Palms (*Kentia Belmoreana*) by potting six plants on sterilised and six in non-sterilised compost; the difference was again very pronounced. We grew *Begonia Gloire de Lorraine* in sterilised soil, and exhibited about two dozen plants at one of the meetings of the Royal Horticultural Society; these plants were in forty-eight-sized pots and most of them measured eighteen inches in diameter. The members of the Floral Committee remarked that these were the finest plants they had seen of *B. Gloire de Lorraine* in such small pots. The foliage was of a beautiful green colour, and the flowers abundant. We were awarded a medal. *John Butler, Rose Cottage, The Moors, Kidlington.*

SOCIETIES.

ROYAL HORTICULTURAL.

NOVEMBER 1.—As is usual at this season, there was a small show at the fortnightly meeting of the Royal Horticultural Society, but the groups of Orchids, Chrysanthemums, Roses, Carnations and general flowers made a bright display. There was also a good collection of Potatoes and several growers set up dishes of Apples of splendid appearance. A number of paintings of flowers and garden scenes and garden plans helped to fill the hall. The Orchid Committee recommended two First Class Certificates and one Award of Merit, and the Floral Committee recommended six Awards of Merit to novelties.

Orchid Committee.

Present: Sir Jeremiah Colman, Bt. (in the chair), Mr. Gurney Wilson (Hon. Secretary), Mr. Frederick J. Hanbury, Mr. Arthur Dye, Mr. J. E. Shill, Mr. Charles H. Curtis, Mr. W. H. Hatcher, Mr. Albert A. McBean, Mr. John C. Cowan, Mr. T. Armstrong, Mr. R. G. Thwaites and Mr. E. R. Ashton.

FIRST CLASS CERTIFICATES.

Cypripedium Chardmoore var. *Alfred Bridges* (*C. Lena* × *C. Christopher* var. *Grand Duke Nicholas*).—A wonderful *Cypripedium* with a big, rounded dorsal sepal that is four-and-three-quarter inches wide, white, with a green base, and purple spots on the green area that also extend to the central part of the white area. The petals are green, marked with purple-brown and the bold lip is also green. Shown by Miss A. B. Moore (gr. Mr. Page), Chardwar, Bourton-on-the-Water, Gloucestershire.

Laelio-Cattleya Sunbelle var. *Sunset* (*C. Thora* × *L.-C. Serbia*).—In this pleasing hybrid the flowers are of excellent substance and well-balanced. The sepals and petals are rosy-mauve; the lip is waved, deep yellow, with a pink margin and some deep purple markings at the front centre. Shown by F. J. HANBURY, Esq. (gr. Mr. Farnes), Brockhurst, East Grinstead.

AWARD OF MERIT.

Laelio-Cattleya Moloch (*L.-C. St. Gothard* × *L.-C. Sargon*).—This is a large-flowered hybrid with sepals and petals of great substance. The flowers are shapely and a fine combination of purple-mauve and old gold. Shown by Messrs. H. ALEXANDER, LTD.

GROUPS.

MESSRS. H. ALEXANDER, LTD., contributed a fine group of well-grown plants, all pleasingly arranged over deep green moss. There were beautiful examples of *Laelio-Cattleya Queen Mary* var. *Brilliant*, with three wonderful flowers; *L.-C. Moloch*, *L.-C. Perseus*, *L.-C. Ishtar*, *L.-C. Fame*, with four handsome blooms; *Brasso-Cattleya Ursula*, carrying a pair of enormous, mauve-purple and gold flowers; *Cattleya Fabia* in variety; the white-petalled *C. Princess Royal*, the gorgeous *C. Cappei* var. *Charlesworthii*, *C. Portia*, *Weston-birt* var., with a spike of ten lovely blooms; *Cypripedium Boltonii*, *C. Actaeus-Bianca*, *C. Argo-Fairrieum*, and the bold *C. Neleus*.

The group arranged by Messrs. SANDERS included a number of examples of *Oncidium tigrinum*, the fine *Cattleya ardentissima*, *C. Princess Royal*, *Laelio-Cattleya Luminosa* var. *Primrose*, *Cypripedium The Queen* and a number of interesting plants of botanical interest. These last were *Catasetum viridiflorum*, *Dendrobium sanguinolentum albens*, *Oncidium bicallosum*, *Coelogyne speciosa*, *Paphinia cristata*, the rare *Galeandra Devoniana*, *Bulbophyllum Medusae*, *Cirrhopetalum Micholitzii*, *Bulbophyllum Careyannum*, and, in the front row, a number of *Pleiones*.

Messrs. COWAN AND Co. submitted a group of *Cypripediums* associated with *Brasso-Cattleya* British Queen, *Cattleya Daedalus* in variety, *C. Mrs. Medo*, *C. Portia*, *Appleton's* var., and the lovely golden *C. Mimosa*. Among the *Cypri-*

pediums those that attracted us most were *C. insigne* *Sanderae*, *C. Elatior* var. *Rex*, *C. Thalia* var. *Mrs. Wellesley*, the very fine *C. Ponticus*, *C. Royal George*, *C. Yadie* and *C. Mortello*. A fine plant of *Masdevallia macrura*, with six flowers, and the interesting *Acampe papillosa* were also included in this exhibit.

The quaint little *Ornithidium Sophronitis* with its tiny red flowers was conspicuous in the small exhibit from Mr. HARRY DIXON; the other plants were *Cypripedium insigne* *Sanderae*, *C. Monitor*, and the old *C. Spicerianum*.

Some beautiful *Odontoglossums* were shown by Messrs. CHARLESWORTH AND Co., the principal sorts in their group being lovely forms of *O. crispum*, *O. Ascania*, *O. Reve d'Or*, *O. Clydonia*, *O. Alvara* and the new, chocolate-red *O. Eudora*. Other good things were *Brasso-Laelio-Cattleya Camara* var. *pulchra*, with golden-bronze flowers, *Odontonia Pittae* var. *Rosina*, *Dendrobium Phalaenopsis alba* and *Vuystekeara Leda*.

F. J. HANBURY, Esq. (gr. Mr. Farnes), Brockhurst, East Grinstead, showed *Laelio-Cattleya Profusion*, with a superb spike of five splendid flowers; *L.-C. Sunbelle* var. *Sunset*, and *Odontoglossum Toreador*, Brockhurst variety. Messrs. J. AND A. McBEAN also showed a fine form of *L.-C. Profusion* and *Brasso-Cattleya Dinestor* (*C. Dinah* × *B.-C. Nestor*).

Floral Committee.

Present: Section A.—Mr. Henry B. May (in the chair), Mr. J. F. McLeod, Mr. Arthur Turner, Lady Beatrix Stanley, Mr. Wm. Howe, Mr. J. M. Bridgeford, Mr. D. Ingamells, Mr. Hugh Dickson, Mr. Courtney Page, Mr. A. E. Vasey, Mr. W. B. Gingell, Mr. J. T. West, Mr. D. B. Crane, Mr. Charles E. Pearson, Mr. G. W. Leak and Mr. W. Cartwright (Secretary).

Section B.—Mr. Gerald W. E. Loder (in the chair), Mr. Charles T. Musgrave, Mr. T. Hay, Mr. A. Bedford, Mr. E. H. Wilding, Hon. Henry D. McLaren, Sir William Lawrence, Bt., Mr. E. A. Bowles, Mr. L. R. Russell, Mr. W. B. Cranfield, Mr. G. Yeld, Mr. F. G. Preston, Mr. G. Reuthe, Mr. W. J. Bean, Mr. R. C. Notcutt, Mr. W. G. Baker, Hon. Vicary Gibbs (visitor), Mr. A. W. Exell (visitor), and Mr. N. K. Gould, (Secretary).

AWARDS OF MERIT.

Chrysanthemum Daphne.—This is a large-flowered Single with several slightly irregular rows of rosy-mauve florets.

Chrysanthemum Pax.—A Japanese variety of considerable value as a cut flower and for conservatory decoration. The round flowers are made up of stout, white florets which have much substance. The undeveloped florets in the centres of the blooms are attractively tinted with creamy-yellow. Both varieties were shown by Mr. H. SHOESMITH, Junr.

Cotoneaster aldenhamensis? *Forrest?*—We believe this hardy, berried shrub was shown quite recently when it failed to receive an award. There seems to be doubts as to the correctness of the name and its origin. It is a robust shrub, of spreading habit. The smallish leaves are ovate-lanceolate, entire, shining green above and paler below. The young stems are reddish. The clusters of small bright red berries are borne in the axils of the leaves. Shown by the Hon. VICARY GIBBS (gr. Mr. E. Beckett), Aldenham House, Elstree.

Crinum zeylanicum.—Illustration No. 1,253 in the *Bot. Mag.* gives a very good impression of the unusual colouring of this old stove plant. The drawing shows the reddish stems and the definite band of red which runs down the centres of the white segments. The plant on view had two robust scapes of flowers which, however, did not yield the fragrance usually associated with the species. The species is a native of Tropical Asia and Africa and was introduced in 1771. Shown by Sir WILLIAM LAWRENCE, Bt., Burford, Dorking.

Eucalyptus leucoxylon.—A number of very beautiful flowering sprays of the White Ironbark tree were shown. When fully grown this *Eucalypt* becomes a tall tree, better furnished with lower branches than is the case with many

members of the genus. The adult leaves are narrowly lanceolate, of dull green colour, with a suggestion of greyness. The upper sides of the young shoots are coloured bright purple, while below they are green, and this definite colour marking is continued in the stalks of the leaves. The flowers, which are borne normally in twos and threes, were a beautiful pale rose-cerise colour. We understand that the flowers are usually white; this pinkish form is highly ornamental and, if it could be grown in sufficient quantity, cut sprays would be valuable for market sale. There is also a form which bears bright purple flowers. Shown by CECIL HANBURY, Esq., La Mortola, Ventimiglia, Italy.

Euonymus grandiflorus.—This Spindle Tree was introduced from Nepaul in 1824. The white flowers, which are produced usually in April, are large for the genus and slightly drooping. The fruits were also large, but not so showy as in some other species; they are lightly flushed with purple and have dull red ribs. The leaves were broadly lanceolate, entire, shining green above and sage-green below. Shown by Sir CHARLES CAVE, Bt., Sidbury Manor, Sidmouth, Devon.

GROUPS.

No doubt in anticipation of the annual show of the National Chrysanthemum Society, to be held later in the week, the KING'S ACRE NURSERY Co. and Messrs. KEITH LUXFORD AND Co. set up good collections of Chrysanthemums.

Several collections of late autumn Roses included many admirable blooms. Mr. GEORGE PRINCE had really good vases of Ophelia, General MacArthur, Mrs. Henry Bowles, Mrs. Herbert Stevens, Madame Edouard Herriot and Golden Ophelia. In the group from Mr. J. H. PEMBERTON we noted Nur Mahal, Dorina Neave, Joanna Bridge, I. Zingari and The Adjutant as being especially meritorious.

An attractive display arranged by Mr. AMOS PERRY contained goodly spikes of *Lilium Wallichianum*, *L. ochraceum*, *Schizostylis coccinea* and the pink variety, Mrs. Heggarty, *Gentiana sino-ornata* and a number of interesting little hardy *Cyclamen* species and varieties. Messrs. ISAAC HOUSE AND SON again showed excellent flowers of their *Scabiosa caucasica* varieties, and included *Kniphofias*, *Heleniums* and dwarf *Michaelmas Daisies*.

In their well-arranged group, Messrs. L. R. RUSSELL, LTD., displayed *Pyracantha Lalandei*, a large quantity of well-berried little bushes of *Skimmia fragrans*, *Pernettya mucronata* and *Ceanothus Gloire de Versailles*. A well-arranged rockery made by Mr. F. G. WOOD was planted with appropriate subjects, and he also displayed *Schizostylis coccinea* and the pink variety Mrs. Heggarty, *Ajuga multicoloris*, and a number of shapely little *Conifers*. The Misses HOPKINS also had a tastefully arranged little rock garden.

Carnations of good quality were shown. Messrs. C. ENGELMANN, LTD., included bright blooms of Spectrum, with Dainty, White Pearl, Janet and other varieties. The chief sorts displayed by Messrs. ALLWOOD BROTHERS included Laddie, Red Laddie, Shot Silk, Edward Allwood and Maud Allwood, and they also staged bowls of *Dianthus Allwoodii*. There were three good collections of Sweet Violets. Mr. BALDWIN PINNEY included a good amethyst-coloured variety named Tina Whitaker. It is said to have originated in Sicily and to be an exceptionally good winter-flowering variety. The flowers are single, borne on stout stalks, and are unusually large. Mr. J. J. KETTLE showed the varieties Princess of Wales and Princess Mary, while Mr. F. RICH had Mrs. Lloyd George and the compact, single pink Rosine. Mr. JOHN KLINKERT had a considerable Topiary collection.

The chief paintings were a collection of prairie scenes and flowers of western Canada and of English gardens by Miss E. S. OUGH, floral studies by Mrs. HENRY SPENCER, and garden scenes by Miss ELLEN WARRINGTON, Miss EVA KIRKPATRICK, Miss A. SPARK, Miss FIELDING and Miss ETHEL ANDREWS.

Fruit and Vegetable Committee.

Present: Mr. Joseph Cheal (in the chair), Mr. William Poupert, Mr. E. A. Laxton, Mr. J. Wilson, Mr. A. W. Metcalfe, Mr. A. Poupert, Mr. P. A. Tucker, Mr. W. H. Divers, Mr. T. Pateman, Mr. E. A. Bunyard and Mr. A. N. Rawes (Secretary).

There were seven seedling Apples before the Committee, but none was considered any advance upon existing varieties. One from Mr. F. S. WILCOX, of Buston, Northampton, and of unknown origin, was much after the style of Blue Pearmain, being a tall, firm, crimson-striped Apple. This Apple is said to keep well until March. Another seedling Apple was sent by Mr. A. W. HYDE, of Kilkenny, for the opinion of the Committee. The sample of fruit was much past its best.

Mr. E. F. GREY-CLARK, of Flancote, East Grinstead, showed a seedling Apple of unknown parentage, the sample being large and brightly striped, but of no particular quality. The fourth, entered as a "non-commercial Apple," was Woolbrook Russet, from Messrs. STEVENS AND SON, Sidmouth, Devon, appeared the most promising. It was raised from a cross between Bramley's Seedling and King's Acre Pippin. The fruits are large, flat, rather uneven, similar in this respect to Bramley's Seedling; with the dull brown flush typical of the other parent, it is said to be in season from September to April. It is regarded as a dual-purpose Apple, being fit for dessert in April and said to cook splendidly. The Committee asked to see this Apple in the New Year.

Another seedling Apple, from Mr. V. MANDERS, King's Lynn, Norfolk, was of the Allington Pippin type. The sample varied in size somewhat, but was generally attractive and of quite fair quality, though not of sufficient improvement on existing sorts to merit recognition.

Mr. J. COVENEY, Bearslid, Maidstone, showed three fruits of a seedling Apple of unknown origin. It is said to grow much after the style of Bramley's Seedling, but the tall, yellowish and flushed Apples are not of the type likely to find favour with the gardener or commercial grower. Yet another seedling, said to have been raised from a New Zealand variety, appeared above the usual standard of seedlings (which are mostly decidedly inferior to standard sorts). The fruits are brightly striped with red over yellow, evenly round and firm.

GROUPS.

Messrs. GEORGE BUNYARD AND Co., Maidstone, staged a remarkably fine lot of Apples and Pears. Over two hundred varieties were tastefully displayed, and in no single case was the quality below first-class exhibition standard. Such an extensive exhibition is seldom seen on the show table, and probably not since the war has this firm—noted for its Apples and Pears—staged such a wonderful exhibit. Many of the varieties were little known to the public, but as arranged in this exhibit each appeared to show some good quality. Outstandingly good dishes—or rather, baskets—were: Apples: Mother, Cutler Grieve, Lord Burghley, Crawley Beauty, Ellison's Orange, May Queen, Sturmer Pippin, New Bess Pool, Ribston Pippin, and Ben's Red. The two comparatively new Apples, Monarch and Upton Pyne were shown in excellent condition. Among the Apples rarely met with we noticed Farmer's Seedling, Chatley's Kernel, Wismer's Dessert, Maltster, King Harry, Stark, Nancy Jackson, Loddington Pearmain, Lord Castlereagh and Wilson's Prolific. Among the Pears, the baskets of Beurré de Naghin, Josephine de Malines, Beurré Six and Santa Claus were prominent. Brightly-coloured Crabs helped to show off the larger Apples, the Purple Crab and Cheal's Crimson being very brilliant. Altogether the quality and arrangement of this splendid lot of fruit left little to be desired.

Messrs. JAMES CARTER AND Co., of Raynes Park, exhibited a splendid collection of Potatoes. The exhibit was tastefully arranged, and the quality of the tubers reached a high standard of excellence. Varieties exhibited included Arran Comrade, Field-Marshal, Great Scot, Edgécote Purple, Majestic, Glen Blue, Red

King, K. of K., and The Bishop. All the tubers were notably clean and even in shape.

Messrs. ISAAC HOUSE AND SON staged a group of their Apple John Standish. The very brilliant red colouring of the fruits, and the shape, suggests a Worcester Pearmain origin. John Standish keeps in good condition until April. It may find a place in the list of commercial varieties.

Mr. HERBERT CHAPMAN exhibited a nice lot of his new Apple, Saltcote Pippin. This is a very handsome Apple, and for eating at Christmas time its delicious flavour and mellow appearance should make it a favourite. It is believed to be a seedling from Ribston Pippin.

LINCOLNSHIRE POTATO SHOW.

THE Holland (Lincolnshire) County Potato Show, held at Spalding, on Thursday, October 27, surpassed all previous records, both in regard to numbers and quality. King Edward and Majestic, for which South Lincolnshire is famous, were the outstanding varieties, although Red King and Great Scot were also very prominent. There were fewer seed Potatoes than usual at this show.

Among the implements, a colossal Potato sprayer, which the South African farmers saw in the district during their recent visit, attracted much attention. This machine was used with remarkable success by a prominent local farmer, and some 254 acres of Potatoes which were sprayed by means of it were practically free from blight. On one stand no fewer than fifty different varieties of Potatoes were shown by a local grower.

The show was opened by the Marquis of Salisbury, who said that no crop figured so prominently in British agriculture as Potatoes and in no county were they seen to better advantage than in the county of Holland; while the fact that they could be cooked in one-hundred-and-fifty ways showed their adaptability to the domestic needs of all classes.

The chief trophy for ware Potatoes in the class open to all England (limited to farmers occupying not more than 200 acres of land), was won by Mr. H. ROUGHTON, of Holbeach, near Spalding, who also carried off a Challenge Bowl for ware Potatoes, white variety.

The Challenge Cup for the best collection of seed Potatoes was won by Mr. WILLIAM GILDING, of Swineshead, near Boston. Mr. T. WRIGHT, of Roxby, near Scunthorpe, in the north of the county, won three Cups, valued at thirty-five, twenty and fifteen guineas, respectively. Mr. B. BASS, of Holbeach, was another successful exhibitor, taking the Holland Farmers' Union Cup, value twenty-five pounds, the Gold Medal given by the Co-operative Wholesale Society, and a Challenge Bowl, all for ware Potatoes.

Mr. W. H. FULLER, of Scopwick, near Lincoln, won a Cup for the variety King Edward, and Mr. J. COCK, of Weston Hills, near Spalding, a Challenge Bowl for the best collection of Potatoes.

Proposing the toast of "Agriculture and the Holland Potato Show," at the luncheon, the Marquis of Salisbury provoked a laugh when he said it was pleasing to sit among a body of agriculturists and not see rows of gloomy faces—"But," he added, "I do not know how far those smiling faces conceal aching hearts!" He believed, however, that things were not quite so bad as painted. They had passed through a depressing time; moreover, the industry was faced with a great many difficulties, and it would be foolish of them not to face these difficulties; and least of all for a member of the Government to hide from himself and his colleagues the strong feeling that existed among agriculturists at the present time. There had, he said, been great changes in the industry of late years, one of which was the great increase in the wages bill. "But," said His Lordship, "I am not one of those who are in favour of low wages; I believe in high wages, and good work." He said he would greatly regret a reduction of wages, because the farm labourer had no more than was absolutely necessary for him to lead a reasonable life. There was, however, a certain spirit abroad in the country which looked upon work as a necessary evil.

That was a profound mistake. From the highest to the lowest, they should strive to give of their best, which was their duty to their country. Alluding to the great increase in the cultivation of Sugar Beet, the Marquis of Salisbury said that this augured well for the future, inasmuch as it showed that energy and enterprise were still the characteristics of those engaged in agriculture. New Sugar factories were springing up in face of the diminishing subsidy, which showed that the industry was on firm foundations, and that it was likely to live when the subsidy had finished.

EGHAM GARDENERS'.

ON Wednesday, October 19, Mr. Theodore Parker, of the Abol Research Laboratories, gave an interesting lecture to the members of the Egham and District Gardeners' Mutual Improvement Association, on "The Principles of Tar Oil Winter Washing for Fruit Trees."

The lecture, which was well attended, was illustrated by lantern slides. Photomicrographs, prepared by the lecturer, were shown of insects' eggs, exhibiting the typical effects of tar oil sprays. The favourite hibernating quarters of various pests were also shown, and glass plates that had been previously coated with wax and sprayed with a wash containing varying percentages of soap and spreaders, were shown to illustrate the importance of overcoming the natural resistance of the egg cover.

The older methods of winter washing were discussed and their advantages and disadvantages explained. Proceeding, Mr. Parker stated that until about three or four years ago it was considered in this country that any chemical which could be used effectively for the destruction of insect eggs would at the same time be detrimental to the tree on which they had been oviposited. As a result of extensive trials carried out during the past two or three seasons it had been demonstrated that the use of the so-called tar oil washes for insect egg destruction must now become a recognised part in the routine of horticultural practice.

Undoubtedly the most suitable time to attack a pest is in its egg stage; it is then stationary and therefore more "get-at-able" and a higher concentration of wash can be used without risk of damage to the tree. Some of the pests to which fruit trees are subject lay their eggs during the autumn on the twigs and branches, where they hibernate over the winter, and, given an unhindered career, hatch out with the advent of spring, coincident with the bursting of the blossom and leaf-buds. It is characteristic of most insects that they deposit their eggs in such a position that when the young emerge they have not far to travel in search of their first meal, hence growers are accustomed to keeping a sharp look-out for certain "undesirables" so soon as the buds begin to open. With the use of the new class of "dormant sprays," although perhaps high in initial cost owing to the concentration at which they must be used, it has been shown that one such spray applied thoroughly means the saving of at least two or three sprayings during the subsequent season.

Experience has shown that all oils do not necessarily possess egg-killing properties, but research has proved that by a suitable selection and blending of oils it is possible to produce a product which possesses to a high degree this desired property. Such blending greatly assists standardisation of the wash.

Having secured the right type of oils, the next problem is to convert them into a water-miscible form. In all spraying operations the carrying medium is water, and it is only too well-known that the softer the water the better for purposes of efficient spraying. As oils do not mix or dissolve in water emulsification is necessary. This process consists of breaking the oils up into microscopically fine particles and surrounding or coating them with a material known as a protective colloid. The function of this material is to prevent the oils from coalescing when they become suspended in water as a milky-white emulsion.

It has been demonstrated that an emulsion may be so good as to be partially ineffective

as an insecticide. In other words, the emulsion becomes colloidal in character. This means that the oil globules are ultra-microscopically small and when added to water produce instead of a thick, creamy fluid, an opalescent solution. In this form it possesses greater spreading properties than is actually required, and instead of thickly coating the egg, runs off, leaving only a very thin film, insufficient to cause the breaking down of the egg coating or shell.

Insect eggs have a very resistant natural covering which is more or less impervious and which makes it difficult to completely envelop them when sprayed. Certain oils possess the necessary properties for this and in order to secure the right degree of spreading it has been found essential to produce an emulsion which will spread sufficiently, at the same time leaving the requisite quantity of oil on the egg surface.

Although no definite experimental proof exists, it is believed that the film of oil left actually kills or prevents the eggs from hatching, as follows:—(1) By causing a gradual disintegration of the chitinous tissue of which the egg shell is composed, which exposes the contained protoplasm; or (2) by being gradually absorbed by the chitinous tissue, thereby coagulating the egg protoplasm; or (3) by the action of capillary attraction the oils gain access to the interior of the egg through the microscopically small air holes in the shell, causing coagulation as in (2); or (4) by coating the shell the newly emerged insect, in breaking through, consumes a portion of the oil sufficient to cause death.

Providing tar oil is used during the absolute dormant period, no detrimental effects upon the tree are likely to occur. On the contrary, these washes appear to produce an emollient effect, slightly softening the bark and at the same time stimulating growth.

Apples may be sprayed so late as the end of February or beginning of March, depending entirely upon the forwardness of the season. Plums should be sprayed not later than December or early January.

Mr. Parker advised growers to spray when the trees or bushes are dormant; use as high a pressure when spraying as possible, 170 lbs. to 200 lbs. per square inch nozzle pressure, as this assists the spreading and penetration of the wash, and helps to overcome the natural resistance of the eggs; spray in fine weather but not during frost; not to use tar oil washes under glass for vine rods or Peach trees, as fumes may eventually be given off by the spray under the action of sun-heat, which might produce a scorching effect upon any young foliage; and to thoroughly wash out the tanks, hoses, and spray lances after use, as all tar oils are likely to cause corrosion of rubber and leather in course of time. He stated that cattle may be grazed upon grass after the trees have been sprayed without any risk of poisoning.

Following the lecture an enthusiastic discussion took place in which the lecturer was bombarded with questions. In reply to these Mr. Parker said that he was of the opinion it might be best to use tar oil wash one year and lime-sulphur wash the next. The fact that the eggs of red spider appeared to be unaffected by this class of wash was interesting, and the increase of this pest since the introduction of tar oil washes might be explained by the fact that we were destroying a predaceous parasite which originally held the spider in check, but which had been killed off as a result of washing.

SOCIÉTÉ NATIONALE D'HORTICULTURE DE FRANCE.

THE second international exhibition commemorating the Centenary of the Société Nationale d'Horticulture de France was opened by the President of the Republic on Friday, October 28, in the Cour la Reine. Lt.-Col. Durham, Secretary of the Royal Horticultural Society, presided over the International Jury, whilst Sir William Lawrence returned thanks at the banquet in the Society's hall, Rue de Grenelle, on behalf of the Jury and Great Britain. The international character of the exhibition was not pronounced; there was one English exhibit,

and Poland, Belgium and Holland were also represented.

The outstanding features of the exhibition were the superb fruits and the magnificent group shown by MM. VILMORIN, ANDRIEUX ET CIE.

A large number of firms showed fruits, but the exhibit of the Société d'Horticulture de Montreuil was outstanding, the Pears being remarkable, especially Beurré Diel, Doyenné du Comice, and Charles Ernest, and amongst the Apples, Linneaus Pippin, Reinette du Canada and Calville Blanc. Other fine collections came from MM. CROUX ET FILS, MOSER ET FILS and NOMBLOT-BRUNEAU; very fine specimens of the Pears Passe Crassane, Conseiller à la Cour and beautifully-coloured Doyenné de Mérode were to be seen in each of these groups. While the Pears surpassed anything seen in England, the Apples, on the whole, fell far below the English standard, most dishes containing spotted and malformed fruits. The three firms mentioned also showed collections of fruit trees, trained and pruned with marvellous skill.

Grapes, as shown in England, are not grown in France, but there were interesting displays of beautifully-coloured Chasselas Grapes from the Gironde district, especially those grown in the neighbourhood of Agen.

An exhibit in this section which specially interested the President of the Republic was one of Walnuts, shown by M. L. TREYE, of Trévoux. The procedure consists in grafting late-flowering varieties, such as the Mayette, Franquette, and Parisienne of Dauphiny, and the Corne of Périgord on the American Walnut (*Juglans nigra*). Such trees do not suffer from late frosts, are not subject to *Armillaria mellea*, and begin to fruit from the second year.

MM. VILMORIN'S group consisted of an immense sunk garden which could be viewed from a semi-circular bay. It was entirely planted with Chrysanthemums in groups of colours and varieties, and occupied the whole of the centre of the exhibition, while on the outside of the gangway ran pergolas, with the vegetable exhibits of the firm, backed by large specimen Chrysanthemums trained in the Japanese manner. This exhibit received the highest awards, including the Sévres Vase presented by the President of the Republic, and the Gold Medal of the Royal Horticultural Society. At the same time, while the *coup d'oeil* was delightful, the individual flowers and plants were not up to the English standard, and this applied to the exhibits generally.

M. LOUIS FERARD had constructed a *tour de force*, consisting of a stream, bordered with Ferns, which ran between high banks of small-flowered Chrysanthemums in bud and flower. By means of a sheet of plate-glass the group was continued outside the tent and became more alpine in character.

Good groups containing Chrysanthemums and vegetables were shown by M. GEORGES TRUFFAUT, and by the ECOLE MUNICIPALE DE PARIS. MM. CAVEUX ET DE CLERC were both on the Jury, and consequently their fine groups of Dahlias were "hors concours."

Orchids were very pleasantly shown in a greenhouse. There were very few novelties, but well-grown plants were staged by MM. MARCOZ, MARON ET FILS, PERRIN and others. Fine spikes of *Phalaenopsis Rimestadiana* were much admired.

The Société is to be warmly congratulated on the show, the success of which is largely due to the Secretary General, M. A. Nomblot, and his colleague M. Leon le Clerc.

ORCHID CLUB.

THE second domiciliary meeting of the Orchid Club was held on October 22. In the forenoon, the collection of Dr. Craven Moore was inspected and the methods of cultivation were explained. In the Odontoglossum range a small group of plants were in full spike, viz., hybrid *O. crispums* and xanthotic *crispums*, together with a beautiful batch of *Oncidium cheiroporum*.

In the *Cypripedium* range there were several

hundreds of plants in flower, including about one hundred examples of *C. Maudiae magnificum* and the especially fine *C. Maudiae* Bank House var.; others calling for special note were: *C. Madame Albert Fevrier*, in several varieties; a fine form of *C. insigne* Royalty, *C. Chrysostum* vars. Chardwar, Lord Lambourne and H. J. Elwes; *C. Viking*, *C. Nirvana*, *C. Monialis* var. Hilda Sharp, *C. Redstart*, *C. The Major*, several good forms of the highly-coloured new hybrid *C. Memoria* J. H. Walker, and three plants of *C. Fairrieum*, with about a dozen flowers, this beautiful species appearing to grow quite luxuriantly in a compost containing limestone in the lower half.

The extensive collection of seedlings was a centre of special interest. In the several houses there is an interesting collection of fly-catching, insectivorous plants, grown for their utility as well as their intrinsic interest.

In the afternoon, the members visited the Daisy Bank collection of Mr. B. J. Beckton, where they had the opportunity of inspecting an entirely different aspect of Orchid culture. In Mr. Beckton's collection species are the dominating feature, together with a selection of fine *Miltonias* and *Cypripediums*. Among the species in flower were *Vanda Sanderiana*, with a spike of eight flowers; *Angraecum Ellisii*, *A. Scottii*, *A. Chailluanum* and *A. Kirkii*; *Coelogyne Veitchii*, *C. fuliginosa* and *C. speciosa* alba; *Cirrhopetalum miniatum*, *C. gracillimum*, *C. campanulatum*, *C. Mastersianum*, *Mundham* var., and *C. ornatissimum*, the latter having eleven spikes. *Eria macrantha* carried seventeen spikes, and several other rare and interesting genera and species were noticed.

The General Meeting was held at Daisy Bank during the afternoon, when the Officers and Committee for the season 1927-8 were elected. Sir William Thom was elected President of the Club.

In view of the special interest and value of domiciliary meetings and the great success of the Club's meeting at Bodnant, North Wales, in June last, by the kind invitation of Lady Aberconway, it was resolved that this type of meeting be continued from time to time, and that the exhibitions of plants in Manchester be proportionately reduced.

GLASGOW AND WEST OF SCOTLAND:

At a meeting of the Glasgow and West of Scotland Horticultural Society, held recently, Mr. S. Williams, M.Sc., Ph.D., of the Botany Department, Glasgow University, delivered a lecture on "Insectivorous Plants," illustrated by lantern slides, and by a small group of plants supplied by Mr. Banks, Superintendent of the Botanic Gardens.

At the outset, Mr. Williams briefly discussed the sources (atmosphere and soil) through which plants obtained their food and emphasized the need for nitrates, which was closely associated with the lecture, because practically every insectivorous plant lived in boggy or wet soil that was deficient in nitrates, and he showed by means of the Pitcher Plant and the Fly Trap, that they found a substitute in insect diet. He afterwards explained the remarkable mechanism provided for the capture and retention of insects, and the way the plants absorbed and digested the bodies they had captured. Under the former head three types were discussed, viz., adhesive, active movement and definite receptacles, while under the latter section attention was devoted to the operations of the glands. On the motion of the Chairman, Mr. Thomas Dagg, a hearty vote of thanks was accorded to the lecturer.

The exhibits consisted of a group of Michaelmas Daisies from Mr. J. G. ROBERTS, Barrhead, and seedling Chrysanthemums, which received the following awards:—First Class Certificate, Mrs. John Wilson; Certificate of Merit: The Provost, Primrose Gem and Mrs. John Scally. With the exception of the last variety, raised by Mr. ALEX. McALPINE, Tollcross, the blooms were shown by Messrs. TORRANCE AND HOPKINS, Busby. Mr. McALPINE also showed nineteen varieties of Chrysanthemums, the plants of which had been raised from seeds sown in spring.

BIRMINGHAM AND MIDLAND GARDENERS.

At the fortnightly meeting, held at the Chamber of Commerce, on Monday, October 24, Mr. J. Smith presided, and a lecture was delivered by Mr. J. Woolman, Shirley, entitled "Some Notes on Chrysanthemums."

The room was crowded, and several members were content with standing room only.

After touching briefly upon the history of the Chrysanthemum, the lecturer dealt with its cultivation and propagation, the composts to use at various stages, temperatures, feeding and top-dressing, stopping and timing of buds; the good qualities and also the defects of the various sections were referred to. Three new Japanese varieties that appear to have a useful future were introduced to the company, viz., Birmingham (crimson), Southampton (pink), and Derby (pale yellow).

Obituary.

John Kay.—We regret to record the death, on October 27, of Mr. John Kay, who retired from the service of Messrs. Hurst and Son eighteen months ago. Born in 1851, he served his apprenticeship with Messrs. F. and A. Dickson, of Chester, and in 1874 joined the staff of Messrs. Hurst and Son, with whom he spent the remainder of his business career, eventually becoming manager of the firm's Clover Seed Department. He was a well-known figure in the Seed Market at Mark Lane, and considered an excellent judge of agricultural seeds—his opinion was highly valued and he was much sought after as an arbitrator. The funeral was held at Golders Green Crematorium on Monday last. In addition to relatives and personal friends, it was attended by a number of representatives of the seed trade. Amongst those sending wreaths were: Mr. and Mrs. J. A. Kay, Mr. and Mrs. Cathcart, The President, Council, and Members of the Agricultural Seed Trade Association, Messrs. William and Edward Sherwood, Office Staff of Messrs. Hurst and Son, Butler Street Staff of Messrs. Hurst and Son, Mr. A. Rousset, Mr. N. Van Lessen, Mr. J. E. Paton, Mr. G. O. Miln, Mr. Horace Burlingham, Mr. T. Pinches, Mr. A. Frankish, and The Directors and Staff, Transport (1910), Ltd.

ANSWERS TO CORRESPONDENTS.

LATE-FLOWERING GLADIOLI.—H. T. Your enquiry is the first of its kind to reach us within our recollection. The corms would certainly have to be carefully selected, potted up about the first week in June, and started in a semi-shaded place and carefully watched. We suggest that in the first instance you make enquiry of one or two of the well-known English growers, and failing them, write to Messrs. Errey Brothers, Camperdown, Victoria, Australia, for a copy of their catalogue, and order what you want immediately on its receipt. The corms should then reach you about the end of May. Their own introductions are moderate in price and, such of them as we have seen, good. The *Quartinianus* hybrids might be useful for your purpose, but of those we know the prices are rather high. We believe Indian Summer was the first of these to maintain its name in the American catalogues, but it was quoted at one dollar per corm last spring. This variety did not bloom in the south of England until the middle of October when planted in the open at the ordinary time. As to varieties—as we have no experience of the actual production of flowers over the time you mention we are not in a position to recommend, but if you decide on trying any Australian sorts, we shall be pleased to give our opinion on receiving from you a list of varieties you wish to select.

LAVENDER PLANTS DYING.—F. D. It is quite probable that your Lavender plants have been killed or weakened by exposure during the winter time. The dwarf form of Lavender

is more subject to injury during the winter than the taller-growing kind, and it is not unusual for plants in their first and second years to die. Older plants withstand severe weather better. As a rule Lavender thrives on comparatively poor soil, although the best results are obtained on loamy soils. If your plants are exposed to strong, salt-laden winds that may very well account for them dying after being established for a year or two.

NAMES OF FRUITS.—H. C. T. Gooseberry Apple.—M. L. 1, Allington Pippin; 2, Wadhurst Pippin; 3, Hollandbury; 4, Chelmsford Wonder; 5, Edward VII; 6, Fish's Pippin.—H. B. O. 1, Jalousie de Fontenay; 2 and 4, Comte de Lamy; 3, decayed.—Altho. Apple Bowhill Pippin; Pear Beurré Superfin.—A. C. 1, not recognised; 2, Bramley's Seedling; 3, Emperor Alexander; 4, Brabant Bellefleur.—L. G. S. Melon Apple.—H. W. 1, Newton Wonder; 2, Dean's Codlin; 3, Reinette Franche; 4, Small's Admirable; 5, Domino; 6, French Crab; 7, Scarlet Golden Pippin; 8, Fearn's Pippin; 9, Hambling's Seedling; 10 and 11, Dumelow's Seedling; 12, Margil; 13, Hormead Pearmain; 14, Bramley's Seedling.

NAMES OF PLANTS.—J. S. B. Nerine Bowdenii, of which there are now several varieties in cultivation.—A. P. 1, *Centranthus ruber*; 2, *Origanum hybridum*; 3, *Erigeron mucronatus*; 4, *Linaria repens*; 5, *Artemisia sericea*; 6, *Zauschneria californica*; 7, *Scelopendrium vulgare*.—Dr. A. 1, *Catananche coerulea*; 2, *Salvia recognita*; 3, *Caryopteris mastacantha*.

OXALIS FOR IDENTIFICATION.—Valley. The Oxalis is *O. incarnata*, of Jacquin, and comes from South Africa. It is not likely that seeds of it can be obtained anywhere in commerce. *O. incarnata* may be increased by growing it in pots or boxes in a greenhouse from which frost is just excluded. Perhaps it would grow most rapidly in a box of rather sandy soil, on which the bulbils of the stem could drop when mature, or the bulbils could be picked off in autumn and planted separately. The bulbs at the root could also be separated in spring and planted out just under the surface. In this country *O. incarnata* is grown in gardens but more often in the windows of dwelling-houses.

PERENNIAL BUTTERCUP IN LAWNS.—H. B. There are three perennial Buttercups common throughout Britain, and two of them may be very dwarf in lawns, namely, *Ranunculus repens* and *R. bulbosus*. The former creeps like a Strawberry, and the latter has a tuberous root, like a corm. Lawn sand will kill the foliage of either, but both will grow again owing to the large amount of reserve food in the root-stock, especially in the case of *R. bulbosus*. The most effective time to apply lawn sand is in April and May when the plants have used up a great deal of reserve food in the production of stems and leaves. A dry day should be selected, after the dew has been dispelled. When the weeds make fresh growth repeat the application, or use powdered sulphate of ammonia, and put a pinch into the crown of each plant. Both these weed-killers act as a fertiliser afterwards, but one application will not kill strong plants of any of these three Buttercups. If *R. bulbosus* is present it would be worth while using a spud to pick out the larger plants during winter, while the soil is soft and least damage is done to the grass. Autumn is the least effective time to apply a weed-killer, because the foliage is naturally dying away.

TOMATO ROOTS ATTACKED BY EELWORM.—C. F. D. The Tomato plant submitted for examination has been attacked by eelworm which produces nodules on the roots. The eelworms live in the soil from year to year and will persist as an infection for next year's crop. The best method of destroying eelworm in the soil is sterilisation by steam.

MARKETS.

COVENT GARDEN, Tuesday, November 1st, 1927.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Tuesday by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market and the demand, and they may fluctuate, not only from day to day, but occasionally several times in the day.—EDS.

Plants in Pots, etc.: Average Wholesale Prices.

REMARKS.—Chrysanthemums are still arriving in very large quantities from all sources. Disbudded blooms are more than sufficient for the present demand, and the heavy supplies of coloured bunch stuff have been difficult to clear, even at very low prices. The best sorts on offer among disbudded blooms are: White: Mrs. Roots, Blanche de Poitou, Mrs. Thorpe and Framfield White; Pink: Cranford Pink, Uxbridge Pink, Ivy Gay and Pink Profusion; Bronze: Alcalde, Jean Patterson and Bronze

Consul; Yellow: Romance, Cranfordia and Harvester; Spray White: September White, Framfield White and Blanche de Poitou; Spray Bronze: Almirante, Mrs. J. Pearson and Source d'Or; Spray Pink: Mrs. Hubert and Pink Profusion; Spray Yellow: Cranford Yellow and Mrs. Adcock. More singles varieties are now on offer and consist chiefly of Phyllis Cooper, Exmouth Pink, Joan Edwards and other crimson varieties. With the exception of Lilium longiflorum, which has advanced in price since Friday last, other subjects made returns similar to last week's quotations. Carnations have increased somewhat in quantity, but the majority are in a very soft condition. Single Violets are arriving in large quantities from Cornwall, Devonshire and the south coast. Amongst Orchids, Cattleyas are more numerous than for some time past; there is also a good supply of Cypripediums to hand and prices are much easier. Some very fine sprays of Oncidium have also been on sale.

REMARKS.—Trade has been variable during the past week and at the time of writing general business is slow for most subjects. Hothouse Grapes are plentiful and cheap, supplies of cold-house Grapes being particularly heavy from Holland. English Apples are inclined to be easier in price after a period of good demand. The few home-grown Pears available are selling satisfactorily. Imported Apples are in fairly heavy supply, the general price levels remaining much as those quoted last week. French Beans from Guernsey are in very poor demand as the competition of Beans from France and our own large supplies of outdoor vegetables, brought along by the open weather, having reduced prices. Mushrooms remain steady in supply and demand. The Tomato trade is not quite so good, with larger arrivals from the Canary Islands available. Cucumbers are firm in price and sell freely. New Potatoes from Guernsey and Scilly are not in great request. Salads sell well. The Potato trade continues firm at a good price level for the best samples.

GLASGOW.

The weather of the past week had a depressing influence on prices of cut flowers, which, in the case of Chrysanthemums, suffered a further set back. Ordinary sprays ranged from 2d. to 4d. per bunch; Phoenix and Betty Spark, 6d. to 8d.; disbudded blooms of September Glory, 8d. to 1s.; Dolores and Almirante, 8d. to 10d.; Harvester,

7d. to 10d.; Sanctity, 6d. to 9d.; Framfield White, 6d. to 8d.; La Pactole, 1s. 6d. to 1s. 9d.; Freedom and Blanche de Poitou, 1s. 3d. to 1s. 6d.; Bronze Consul, 1s. 6d. to 1s. 9d.; Pink Delight, 2s. 3d. to 2s. 6d. (12's); Bronze and Pink Consul, 3s.; and Alcalde, 1s. to 1s. 6d. Carnations made 2s. 6d. to 3s. per dozen; pink Roses, 2s. 9d. to 3s.; red, 1s. to 1s. 6d.; and white, 1s. 3d. to 2s.; Michaelmas Daisies, 4d. to 6d. per bunch; Lily-of-the-Valley and Lilium Harrissii, 2s. to 2s. 6d.; and Calendula, 3d. to 4d.

In the fruit market Apples were in fair demand in view of the approach of Halloween, but the smaller imports from America kept prices firm. Canadian Baldwin, No. 1, were worth 30s. per barrel; Cranberry Pippin, 26s. to 28s.; York Imperial, 26s. to 34s.; Jonathan, 15s. to 18s. per case; Wealthy, 13s. to 16s.; and McIntosh Red, 17s. 6d. Winter Nellis Pears, 15s. to 16s. per half case; Beurré Hardy, 27s. per case; Brazil Oranges, 26s. to 28s.; Jamaica, 18s. 6d.; South African, 21s. to 26s.; Sunkist, 28s. to 30s.; Kippen Grapes, 3s. 6d. to 4s. per lb.; imported, black, 10d. to 1s.; Almeria, 25s. to 35s. per barrel; Porto Rico Grape Fruit, 24s. to 25s. per case; Brazil Nuts, 96s. to 100s. per cwt.; Walnuts, 88s. to 96s.; Barcelonas, 46s.; Cobnuts, 60s.; and Peanuts, 36s.; Lord Derby cooking Apples, 8s. to 9s. per bushel.

Scotch Tomatoes averaged 7d. to 8d. per lb.; Jersey, 1s. to 3s. per chip; Mushrooms, 2s. 6d. per lb.; Celery, 2d. to 4d. per root; Brussels Sprouts, 8s. 6d. per 40 lbs.; English Cucumbers, 9s. per dozen; Scotch, 2s. to 5s.; Cauliflowers, 3s. to 5s. 6d.; French Lettuce, 1s. 9d.; home 1s.

TRADE NOTE.

WIDESPREAD interest has been aroused by the Onion-growing competition promoted by Messrs. Fogwills of Guildford, with their variety named Guildford Champion. Particulars of the competition were set forth in the advertising columns of this journal some months ago. More than 5,000 packets of seeds were sold to would-be prize-winners in all parts of England, Scotland, Ireland and Wales, and bulbs were received from all these countries. An inspection of a considerable number of the entries afforded ample evidence that the frequent rains and sunless days of the summer months, while favourable to growth of Onions—so far as size is concerned—was nevertheless a disadvantage when it came to harvesting the crop. Some bulbs weighed over 2 lbs., and a few nearly 3 lbs., but these were not the prize-winners, as they lacked firmness. Mrs. FARNHAM, The Heights, Witley, Surrey (gr. Mr. Binnington), was awarded the first prize: £4 in money and a Gold Medal; Mr. T. C. SADLER, Willingham, Shamley Green, near Guildford, won the second prize: £2 and a Silver Medal; while the third prize of £1 and a Bronze Medal was won by Mr. A. J. BUCK LYPIAT, Park Gardens, Stroud, Gloucester. We understand a similar competition will be held next year.

GARDENING APPOINTMENTS.

Mr. W. Mason for the past eight years gardener to the late Miss A. PECKOVER, Sibalds Holme, Wisbech, Cambridge, as gardener to P. BALMER LAWRIE, Esq., The Square, Kingsley Green, Haslemere, Surrey. (Thanks for 2/- for R.G.O.F. Box.—EDS.).

Mr. George Annand for the past eight-and-a-half years gardener to C. E. HOWARD, Esq., Coombe Park, Whitchurch, Oxon., and formerly at Basildon Park Reading, Berks., as gardener to Sir JOHN WORMALD, Springs, North Stoke, Oxon. (Thanks for 2/6 for R.G.O.F. Box.—EDS.).

Mr. W. Lee for the past six-and-a-half years foreman to the late Mrs. HAMILTON FELLOWS, Tangle Park, near Guildford, as gardener to The Rt. Hon. THE EARL of ILCHESTER, Melbury Park, near Dorchester, Dorset. (Thanks for 2/6 for R.G.O.F. Box.—EDS.).

CATALOGUES RECEIVED.

WATKINS AND SIMPSON, 27, Drury Lane, W.C.2.—Novelties and Specialities for 1928. (Wholesale).

HURST AND SON, 152, Houndsditch, E.1.—Novelties and specialities. (Wholesale).

WM. FELL AND CO., Hexham.—Forest Trees, Roses, fruit trees, etc.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 42.6.

ACTUAL TEMPERATURE—
The Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, November 9, 10 a.m. Bar. 29.6. Temp. 39°. Weather, Sunny.

Autumn Coloration. THE strangely good behaviour of garden plants during the present year has already been commented upon in these pages, but the fact that it is being maintained until the end also deserves notice. When has so sunless a year approached its end in such a blaze of glory, and when has it ever been so manifest that garden plants refuse to play life's game according to what was supposed to be the rules? With plenty, and, indeed, just now too much, of water in the soil and genial autumn suns with but little power, it was to be supposed that the leaves would remain long on the trees and shrubs. In this present year, however, some do and some do not. Beech and Hornbeam which ought not yet to begin to discard their leaves, are dropping them fast, and already a Hornbeam hedge under our eye as we write has lost half its foliage, in spite of the fact that it was pruned in August—a generally sure means of preventing leaf-fall until the New Year. So also the Scarlet Oak burst a fortnight ago into brilliance, yet "held in perfection but a little moment." What shall we make of the fact that whereas the hedgerow Elms are only just beginning to grow golden, the Wych Elm is already leafless? Yet on the other hand there are trees which assumed their autumn garb weeks ago and are still wearing it. The Liquidambar, *L. styraciflua*, supplies an

example. This lovely tree which is all too little grown, has been for three weeks now not crimson, as it is in most years, but of bright purple tint. Yet beside it are other young specimens which have not yet changed the light green of their summer dress. A like reluctance to be done with this year's life is shown by *Parrotia persica*, on whose leaves is yet scarcely a hint of the tawny yellowness slashed with red which is their all but unique autumnal distinctness. The Vines, likewise, and especially *Vitis Coignetiae*, are holding their brilliance so well that they light up the pergola fifty yards away with hard crimson flame. Like the Vine in colour is *Berberis Thunbergii*, but although its leaves are flaming they are falling too. There was a moment a week or so ago when by far the loveliest object was a bush of *Pyrus arbutifolia*—a plant always to be prized for the starry white blossom which it bears, but which came out this year in an autumn habit of soft purplish-crimson and wore it for two weeks and more—though now the glory is departed and the fallen leaves make only a pale yellow carpet on the ground. And so the chronicle of colour might be continued almost indefinitely. *Stranvaesia undulata* with the added merit of evergreenness is a colour subject which no garden should lack; for if it be pruned annually the plant may be kept within bounds and the vinous autumn hues of its leaves add brightness to the shrubberies when that quality is apt to be lacking. The leaves of the Dog Wood (*Cornus alba*) made this year a brilliant but quick descent, but on the other hand, the *Amelanchiers* (*A. canadensis*) are pursuing a leisurely path to soft loveliness of coloration. Beside all these manifestations, knowledge is mute. It can offer nothing but the slenderest of comments on the cause of autumn coloration. All it can say is that these bright tints are but the expression of lethal changes which the green pigments and other constituents of the cells of leaves undergo when life is departing from them. In that phase of incipient dissolution the cell-barriers which kept enzymes and pigments apart, break down, and so as a dying fire flickers up before extinction so the life of the leaf bursts momentarily into brilliance before it fades away. How to encourage this swan song of colour we do not know, or know but very little. Perhaps a little potash might help the leafage, as it is said to help fruits to colour, but why there should have been this year so much capriciousness and so much brilliance of autumn coloration as certainly escapes our knowledge as it delights our eye.

Bequest to The Gardeners' Royal Benevolent Institution.—The late Mr. Thomas Manning, formerly Manager to Messrs. James Veitch and Sons, Chelsea, bequeathed to The Gardeners' Royal Benevolent Institution a legacy of £100, free of duty and unconditionally. Mr. Manning had been an annual subscriber to the Institution for sixty years, and was for a long period an Honorary Auditor of its accounts.

Dutch Method of Storing Onions.—A very interesting account is given in the current issue of the *Journal of the Ministry of Agriculture* (November, 1927) of a novel method of storing Onions, adopted by the growers in the north of Holland. It appears that only the large Onions are stored, and these are set up in piles in the open field. The basis of the operation is an iron band supported on four legs; its height from the ground is two feet three inches, and the diameter about three feet. A "piler" is placed in position after straw has been laid on the ground. Around the piler a walling of Reeds is set and held in position by iron bands. The Onions are then filled in and packed carefully,

the piler being raised as the work proceeds, and wires placed around the walling of Reeds. The piler may be raised a second time and more Onions filled in before it is finally withdrawn, but each time it is raised wires are placed around the Reeds to keep them in position. After filling in is finished, the Onions are covered with mats and left for a few days to settle down. Eventually, when the pile is complete and firm, a conical thatching of straw is placed on the top. The piles of Onions thus constructed are left undisturbed until the contents are required, receiving, meanwhile, the beneficial effects of sun and wind in the open field. No attention appears to be required beyond an occasional inspection, especially after storms, to see that the caps have not been damaged or dislodged. Of course, this method of storing does not give protection against frosts, and certainly not against severe frosts, but Onions can withstand a fairly sharp frost without damage, although they must not be handled under any circumstances until the frost has thawed out. The piles of Onions are often built up to a height of about five feet three inches, and when numbers of them appear in a field they present a very novel appearance. Where piles are constructed of less diameter than that stated, additional stability is afforded by means of vertical and also horizontal stakes, as guards against damage by wind. In the southern Holland islands and in Zealand the method of storing Onions in pilers is not adopted, but large clamps are constructed, with stout wooden, upright supports, open batten sides, and thatched roofs.

Legacy to a Gardener.—Mr. Edward Till, of Studley, Weybridge, who died on August 7, last, leaving estate of the gross value of £56,401, bequeathed £100 to his gardener, Mr. Frank Anstead.

Belgian Horticultural Paper Ceases Publication.—We regret to learn that, owing to lack of adequate support, the Belgian horticultural journal, *La Tribune des Sociétés Horticoles*, has been compelled to cease publication and will not appear again after the issue of December 21. This paper should not be confused with *La Tribune Horticole*, the only Belgian weekly horticultural journal, which we trust will continue to appear for long years to come.

Packing Chrysanthemums.—Some useful directions for the safe packing of Chrysanthemums for travelling are given in our Berlin contemporary, *Die Gartenwelt*, for November 4. The article states that blooms intended for transit should be gathered in the evening or early morning, and left standing upright in water, in a cool, dry room, especially thick or woody stems being first cleft; in gathering, the stems should be broken, not cut. In Holland, however, it is the practice to pack the blooms so soon as they are gathered; the flowers are found to be a little limp on arrival, but freshen up well, especially if placed in warm water; this method, however, is not suitable for long journeys. The flowers should be gathered either when just full blown, or a little before; well developed buds will open fully when placed in water. Show blooms must be packed separately in tissue paper; spray blooms may be placed together in bundles. They must be packed tightly enough so as not to shift in transport, and must be perfectly dry in all parts, otherwise the foliage may decay, or brown spots appear on the florets. The stems must be quite straight, not bent, and the insides of the boxes well lined with newspaper so as to exclude frost. The stems are usually tied to the bottom of the box to avoid shifting, but in very inclement weather this practice is dangerous, as frost is apt to enter through the holes. Between and under the stems stout rolls of paper should be interpolated, so that the spaces between the flowers shall be well filled, and the blooms shall not press down on to the bottom of the box, which might result in their being broken. With very choice blooms, cross pieces of wood are securely fastened over each layer of flowers, with plenty of paper packing to protect the flowers from the wood; the top layer of packing should be a little above the edge of the box, over which a good strong lid should be securely nailed. In very cold

weather, when more paper is necessary to protect the blooms from frosts, extra care is needed in unpacking the cases. The flowers should not be brought at once into a warm room, but accustomed gradually to the temperature in which they are finally to stay.

Unpublished Letters of John Ray.—Rotographs of some unpublished letters of John Ray were exhibited recently at the Linnean Society. The letters were written by Ray to the antiquary, John Aubrey, and to the Keeper of the Ashmolean Museum, Edvard Lhwyd, between 1676 and 1703; they therefore cover an important part of Ray's life, and are supplemental to the letters already edited for the Ray Society by Dr. Edwin Lankester in 1848, when they do not appear to have been available for study. It is now proposed to print them *in extenso* as an extra volume in the Ray Society's Series, together with Ray's letters to the Secretaries of the Royal Society, and with those portions of his other letters which his editor of 1848 saw fit to omit. Dr. R. W. T. Gunther will be very glad to receive information as to the whereabouts of any other unpublished letters of the distinguished naturalist.

Royal Horticultural Society's Examinations in 1928.—The Royal Horticultural Society's Examinations will be held in 1928 as follow:—Written Examinations: General Examination (Seniors and Juniors), Wednesday, March 21; Teacher's Examination (Preliminary and Advanced), Saturday, March 24; National Diploma (Preliminary and Final), Saturday, May 5. Practical Examinations.—Teachers' Examination (Advanced), Friday, June 15; National Diploma (Preliminary), Tuesday and Wednesday, June 19 and 20; National Diploma (Final), Thursday and Friday, June 21 and 22. All entries, except those for the National Diploma, should be made on the form in the syllabus, obtainable from The Secretary, Royal Horticultural Society, Vincent Square, Westminster, S.W.1.

Heavy Single-root Potato Yields.—Mr. T. Milne, 12, Rainton Road, Elmfield, Doncaster, lifted, on October 1, 24 lbs. 6 ounces of tubers from a single root of a new second-early immune Potato named Sefton Wonder. Other weights lifted on the same date in different districts were: 22 lbs. 2 ozs., by Mr. W. H. Walley, Bank Cottage, Ponsanooth, Perranwell, Cornwall; 20 lbs. 6 ozs., by Mr. R. C. Beard, 2, Railway Cottage, Llanwryd Wells; 19 lbs. 11 ozs., by Mr. W. Wood, gardener to Dr. Randle Leigh, Waterloo, Lancashire. Allowing that in this competition (instituted by Garden Supplies, Ltd.) each plant occupied one square yard, and taking the average yield to be 20 lbs. per root, the weight of the crop per acre would amount to over forty-three tons.

Horticultural Trade in Roumania.—The Horticultural trade in Roumania, which has had, in common with the trade of most of the central European countries, a very difficult time during the years following the war, is now making excellent progress. Profiting by past experience, growers are coming more and more to specialise in the cultivation of certain produce found to succeed well in Roumania, and there are now establishments almost solely concerned with Cyclamens, Carnations or Roses. Vegetables are cultivated on a large scale at a distance from the towns, where land is cheap and labour can be procured at the lowest agricultural wage; while growers of "primeurs," or early vegetables, can find, nearer the centres of population, a ready sale for their produce. Indeed, of these "primeurs" the demand is in excess of the available supply, and much of this early produce is imported from Asia Minor. The importation of horticultural produce and plants has assumed large dimensions; goods are sent from Belgium, England and Holland (via Danzig), the transit taking only fifteen to seventeen days. From France, the journey, which is made by water, is much slower, taking thirty to thirty-five days. The quick transit from England is largely due to a line built by the English, known as the Overland Rapid Service; it is true that freight charges

by this line are heavier than by water, but the higher cost is compensated by the convenience. The trade in fruits is rapidly progressing, the demand increasing each year. In the lower Carpathians, Apples and Plums are mainly grown, while, on the plains, Cherries and Apricots are planted in large numbers and find a ready market. A certain amount of fruit is exported, and there seems a hopeful future for this trade. Cut flowers are little, if at all, grown for commerce; they are so perishable, and the market in fresh flowers so poorly organised that nurserymen do not dare to embark on so hazardous an enterprise.

Mr. S. Suzuki.—The youngest son of the founder of the Yokohama Nursery Co., Ltd., Mr. S. Suzuki, was recently appointed President of the Company in succession to his late brother, Mr. H. Suzuki, who was a great botanist and often accompanied Mr. E. H. Wilson during his travels in Japan. Mr. S. Suzuki has acquired a very extensive commercial horticultural experience; he spent several years in American nurseries, finally coming to London, where he was engaged at Messrs. James Veitch and Sons' nurseries at Feltham, afterwards entering

MR. S. SUZUKI.

the offices of his company at Craven House, Kingsway, prior to returning to Japan. Mr. S. Suzuki has travelled extensively in America, Europe and Japan and re-visited England a few months ago. He has a wide knowledge of Korea, where he is creating a large fruit-growing establishment in connection with his firm's products. Besides being a keen horticulturist, a seeker after novelties, and an extensive cultivator of Lilies, Mr. Suzuki is also a great lover of horses, and is seldom happier than when travelling on horse-back.

Imperial Fruit Show.—Considerable success attended the Imperial Fruit Show held in the Belle Vue Gardens, Manchester. This was the second exhibition of its kind held at Manchester, and it was opened by the Rt. Hon. Walter Guinness, Minister of Agriculture. The Horticultural Department of the University of Reading was especially successful, winning first prizes for four bushel boxes and for four half-sieves of Cox's Orange Pippin Apple; first, second and third prizes for four bushel boxes of Worcester Pearmain; first prize for four half-sieves of any dessert variety other than Cox's Orange Pippin; first prize for four bushel baskets of Newton Wonder; and second and third prizes for four bushel boxes of Newton Wonder, being only beaten by a quarter of a point for first prize. A similarly small margin lost the first prize for four bushel boxes Bramley's Seedling. Other awards included

a Silver Cup for the highest number of points for dessert Apples packed in boxes in the United Kingdom; a Silver Challenge Cup for the best exhibit of Cox's Orange Pippin or Worcester Pearmain in the Kent and southern counties section; a Gold Medal for the best exhibit of Newton Wonder grown in the United Kingdom, and a special prize for the best packed exhibit in half-sieves. We congratulate Mr. A. J. Cobb, and Reading, upon this success.

Bulb Growing in Dublin.—Under the auspices of the Dublin Garden Window Box Guild an interesting and informative lecture, with practical illustrations on "Bulb Growing in Towns," was delivered by Mr. J. W. Besant, Curator of the National Botanic Garden, Glasnevin, on November 4. In opening his remarks, Mr. Besant showed a keen sympathy with those who laboured under the adverse atmospheric conditions so prevalent in and around our towns. The lecturer dealt mainly with the use of Daffodils, Tulips, Crocuses, Chionodoxas and Snowdrops, but consideration was given also to Scillas, Ranunculuses, Irises (English and Spanish), all of which are too seldom seen in our gardens. It was pointed out that with due care in culture and selection, a succession of bulbs may be maintained in flower through the greater part of the year. After many useful hints on cultivation, selection of colours, etc., the meeting was thrown open to discussion.

November Flowers at Burford.—Sir William Lawrence, Bart., Burford Lodge, Dorking, writes: "The first of November was warmer than midsummer day. On a south wall, *Buddleia madagascariensis* is covered with sprays of scented, orange-coloured flowers, and through it grows the climbing *Dahlia*, *Hidalgoa Wercklii*, covered with scarlet blossoms. These plants will inevitably be cut down by the first sharp frost, but they grow easily from cuttings and reach fifteen feet to twenty feet in the course of a year, when planted early in May. Further along is another *Buddleia*, *B. auriculata*, a mass of small, pale-apricot flowers which exhale a strong scent of pot-pourri. In front, the 'Lily of the Field' is full of flowers of great substance, half the border being occupied by *Sternbergia sicula*, with narrow leaves developing before the flowers, and the other half with *S. flava* var. *macrantha*, the flowers of which are larger and later and appear before the leaves. Elsewhere are a few bulbs of the true *S. macrantha*, a very large species. In the same border the *Teneriffe Cistus*, *C. vaginatus*, is in full flower, as is one of several plants of *Fremontia mexicana*. *Salvia uliginosa*, sky-blue, has never been more lovely; *S. involucrata* var. *Bethelli* is at its best; *S. rutilans*, grown for the Pineapple-scented foliage, is in flower, as also is *S. Pitierii* (a doubtful name). On the east border, the scarlet and yellow *Cuphea* has been in flower since May, as has *Mimulus glutinosus*; now these are joined by *Liriope spicata* (green-leaved form) with its purple spikes, and *Grevillea rosmarinifolia* just coming into flower. Hard by grows a charming, late-flowering annual, *Gilia coronopifolia*, with flowers that vary from white and blush through yellow to salmon-pink and rose; they open well when cut. *Nerine Bowdenii* is a mass of flowers and does much better planted out than in pots. Why *Amaryllis Belladonna* is always a failure at Burford is a mystery; it has been tried under every conceivable condition, as suggested by successful cultivators, but rarely produces more than two or three spikes, the majority of the bulbs producing their spikes, with the leaves, in the winter and thus they become frosted. Two good winter shrubs are in full flower—*Viburnum fragrans* and *Pyrus subhirtella autumnalis*; *Ceanothus Gloire de Versailles* and *Escallonia montevidensis* still make a brave show, and the fragrant *Eupatorium Weinmannianum* carries quantities of snow-white panicles. There are many species of *Crocus* in flower, big patches of *C. Tournefortii*, *C. ochroleucus* and *C. laevigatus*. *Cyclamen coum* is just pushing up, and among Snowdrops there are *Galanthus Olgae* and *Galanthus byzantinus* "November," punctual to a day. The *Colchicums* are nearly over, but *Colchicum Decaisnei* has a few good flowers, and a similar plant, more richly-coloured, with deep-purple tube, is very handsome and is wrongly labelled *C. Ritchei*; *C. Troodii*, a

minute flower, has been out for some time. Perhaps the best plant in the wild garden is *Polygonum campanulatum*, the flowers of which are now a deep pink; this forms a delightful group with *Gentiana sino-ornata* and *Aster Thompsoni*—the latter a first-class Michaelmas Daisy, neat of habit and carrying a succession of flowers. *Clematis tangutica* is full of yellow flowers and silvery seed-heads, and the *Mutisia* introduced from the Andes by Goethe—*M. retusa glaberima*—produces large, shell-pink flowers from time to time. Berried shrubs and autumn colour are another story, but everyone should secure the hermaphrodite form of Butcher's Broom (*Ruscus aculeatus*), which is now a mass of large scarlet berries."

Chrysanthemums in the Liverpool Parks.—Very fine displays of Chrysanthemums are now attracting crowds of visitors to the principal open spaces at Liverpool, notably Stanley Park,

was remarkable for the abundance and brilliant colour of the fruits it carried; we have never seen branches so heavily cropped. The kinds submitted were *Berberis polyantha*, *B. Fireflame*, very beautiful; *B. Wilsoniae*, *B. aggregata*, almost a solid mass of coral berries; *Hippophae rhamnoides*, *Pyracantha coccinea*, *P. Rogersii* and *Cotoneaster frigidula*.

Watford Horticultural Society.—At the annual meeting and dinner of the Watford Horticultural Society, the Earl of Clarendon announced that the Society would hold two exhibitions in 1928, one at Cassiobury Park, in July, and one in the Clarendon Hall, in November.

Appointments for the Ensuing Week.—MONDAY, NOVEMBER 14: National Chrysanthemum Society's Floral and Executive Committees meet; United Horticultural Benefit and Provident Society's meeting; Guildford and District

"Gardeners' Chronicle" Seventy-five Years Ago.—*Medal for Chrysanthemums.*—Our readers are aware that the Horticultural Society offered medals for Chrysanthemums, shown in sixes, at their meeting on the 2nd of this month, and that the gloomy, unfavourable weather had so entirely stopped the opening of these flowers as to prevent any varieties being shown, except a few Pompons. We are glad to announce that the Council have, in consequence of this unforeseen difficulty, agreed to give medals for Chrysanthemums at the meeting on December 7, when the growers will have a good opportunity of showing their strength. As there is to be an exhibition of autumn-flowering Heaths, table Pears and forced vegetables, on the same day, in addition, a large meeting may be expected. Exhibitors must, however, recollect that everything for competition must be in Regent Street at the latest by 11 a.m., that is to say, three clear hours before the meeting, which takes place at 2. If the plants do not

FIG. 168.—EUCALYPTUS LEUCOXYLON.

Sefton Park, Calderstones Park, Newsham Park and the Botanic Gardens. The educational value of these displays is recognised by teachers who may frequently be found visiting the various parks with their scholars.

New Biological Buildings for Birmingham University.—The Departments of Botany, Zoology, Brewing and Bio-chemistry of Fermentation at the Birmingham University have now been moved to the new buildings opened on October 20 by Mr. Stanley Baldwin, the Prime Minister. The new buildings form part of the original design of Sir Aston Webb, and face University Road; the total cost of buildings and equipment is not less than £120,000, and towards this sum Sir William Waters Butler—an ardent horticulturist—has generously contributed £40,000, while an anonymous donor has given £5,000.

Berried Shrubs.—We have received from Mr. H. W. Hopkins, gardener at Joyce Green Hospital, Dartford, numerous branches of several useful, berried shrubs. Each specimen

Gardeners' Association's meeting. TUESDAY, NOVEMBER 15: Royal Horticultural Society's Committees meet; Lancaster and District Horticultural Society's show; Birmingham Chrysanthemum Show (three days). WEDNESDAY, NOVEMBER 16: Hull and East Riding Chrysanthemum Society's show (two days); Buxton and District Chrysanthemum Society's show; Kings Lynn Horticultural Society's show; Belfast Chrysanthemum Society's show (two days); Ayr Chrysanthemum Society's show; Royal Gardeners' Orphan Fund meeting; London Gardens Guild Lecture. THURSDAY, NOVEMBER 17: Newport (Mon.) Horticultural Society's show; Ipswich Gardeners' Association's meeting; Wallington Horticultural Society's lecture; Linnean Society's meeting. FRIDAY, NOVEMBER 18: Leicester Chrysanthemum Society's show (two days); Bolton Chrysanthemum Society's show (two days); Dundee Horticultural Society's show (two days); Association of Economic Biologists' meeting. SATURDAY, NOVEMBER 19: British Mycological Society's London meeting at the University College.

arrive in time, they will run a great risk of not being received, the new arrangements for the Society's exhibitions rendering it absolutely necessary that the room should be in perfect order by two hours before the meeting, at the very latest. We have also the satisfaction to announce, for the information of the Fellows of the Society, that their much-valued special privilege of entering the Gardens of the Society on exhibition days at half-past twelve, with one friend—or of transferring the privilege to a brother, sister, son, daughter, father, mother or wife, residing in his house—has been extended, so that each Fellow, or his representative within the above-mentioned limits, may introduce two friends early, instead of one. *Gard. Chron.*, November 13, 1852.

Kirk; illustrated; Edward Arnold and Co., 41, Maddox Street, W.; price 42/- net.—*The Potato: its History, Varieties, Culture and Diseases*, by Thomas P. McIntosh; illustrated; Oliver and Boyd, Tweeddale Court, Edinburgh; price, 12/6 net.

THE ORCHID HOUSES.

By J. T. BARKER, Dunstable, Bedfordshire.

Dendrobium Phalaenopsis.—Plants of this Orchid have their flower spikes well advanced, if not already in bloom; as foggy weather affects the flowers it is desirable, especially in the vicinity of towns, to have the plants in bloom early. Whilst the plants are carrying their flower spikes, a moderate supply of water at the roots is necessary, but after the blooms are removed, sufficient moisture only is required to keep the pseudo-bulbs from shrivelling. During the inactive period, an intermediate temperature will answer their requirements.

D. formosum.—This species grows well in company with the last-named, requiring an almost unshaded position and plenty of heat and moisture. *D. formosum* does not require large supplies of water, even during the growing season, and in winter very little moisture will suffice to keep the pseudo-bulbs from shrivelling. *D. infundibulum* and *D. Jamesianum*, two other members of the nigro-hirsute section of *Dendrobiums*, grow best in a cool, intermediate temperature the whole year round.

Temperatures.—The following temperatures should now be maintained for the winter months:—East Indian house, 60° to 70°; Cattleya house, 55° to 60°; Mexican and intermediate house, 50° to 60°; cool house, 45° to 50°. No harm will follow if the temperatures fall a few degrees lower for a short time during periods of extreme cold or high wind. During the next few months the heating apparatus will have to provide most of the necessary warmth in the various houses, and it should be used with discretion, for many troubles are due to faulty heating. The injurious effects of artificial heat during unusually cold weather should be, so far as possible, minimised by the admission of fresh air and the provision of moisture. The great difficulty is to balance the four great essentials—light, heat, moisture and air. The use of a moderate amount of water in damping the paths, stages, and immediately under and around the pipes will prevent that arid atmosphere which is so harmful to plant life, but damping must not be overdone, as one extreme is as bad as the other.

Economy of Heat.—In order to economise heat, it is a good practice to cover the house with canvas or lath roller blinds, which may be let down whenever necessary; these make a considerable difference to the temperature, but they should not be allowed to remain down when they obstruct the light, as light is valuable at this season. In cold, windy weather these coverings should be made secure, so that they cannot break the glass. Canvas blinds should be placed only on the warmest houses, as it often happens that on cool houses they become frozen so stiff that they cannot be rolled up for some considerable time, and many valuable hours of good light are lost. Wash the glass periodically, especially if the houses are near trees or close to large towns, as cleanliness is one of the greatest aids to good cultivation, and should be practised in every detail.

THE KITCHEN GARDEN.

By R. H. CROCKFORD, Gardener to THE RT. HON. LORD WAVERTREE, Horsley Hall, Gresford, N. Wales.

Chicory.—Lift the roots of this salad as required and twist off the leaves. Place the crowns fairly thickly together, either in boxes or in beds of soil at the coolest end of the forcing house. Do not use much heat or the blanched growths will be tough and stringy and quickly fall a prey to aphids. Keep the roots and atmosphere moist. Any dark shed will be found suitable for blanching this salad.

Other Salads.—Maintain a succession by sowing seeds of Lettuce, Radish, and Mustard and Cress at intervals in a warm house or frame, and by blanching Endives so soon as the plants are fully grown.

Broccoli.—The heads of winter and spring Broccoli should be laid towards the north by taking a trench out in front of the plants and carefully pressing them over; cover the stems with the soil taken from the next trench. This protects the stems from frost and also keeps the plants in position. Broccoli treated in this way are, in most cases, able to withstand a hard winter without much damage. If the weather is exceptionally severe later (and in very cold districts) a little dry litter or Bracken laid over the bed will make all secure.

Cauliflowers.—The latest batch of seedlings should now be pricked out into cold frames, using the lights only when weather is frosty or excessively wet.

Spring Cabbage.—Slugs appear very troublesome in this mild, wet season, therefore keep young Cabbage plants lightly dusted with old soot, and hoe between the rows so often as possible. Where the earliest plants are sufficiently large, draw a little soil up to the stems to form a slight protection against severe weather. The latest planting should now be completed. Retain unused plants in the reserve beds in case of later losses in the main crop.

Young Carrots.—Seeds may now be sown on gentle hot-beds, so as to maintain a succession of young Carrots throughout the season.

Potato Sets.—A box or so of these may be stood in a warm, light house, so as to be sufficiently sprouted by the end of the year, for growing in pots for the earliest supply.

FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P., Ford Manor, Lingfield, Surrey.

Orchard House.—The orchard house should be cleansed at once if very early forcing is contemplated, as the time has arrived for placing the trees in position. When selecting Peaches and Nectarines for starting in November, choose trees of early varieties well set with buds, as these will respond more readily, especially if the pots are not too large and are well filled with healthy roots. Duke of York, James Walker and Duchess of Cornwall are good Peaches for early forcing; Cardinal and Early Rivers are excellent Nectarines. Cleanse each tree with soft soap and sulphur before placing it in position; keep the heads of the trees well up to the glass, but allow plenty of room for full development. Mild bottom heat is a great help in forcing, therefore it is a good plan to elevate the trees on inverted pots of various sizes (thus regulating the height of the heads), as this will permit the introduction of a larger body of fermenting leaves about them. If they were well disbudded in the spring and all superfluous shoots were removed after the crop was gathered, the trees will require very little pruning; nevertheless, some of the shoots may be cut back to triple buds about twelve inches from their origin, whilst others may require hard pruning to ensure a relay of young growth for another year. The leaders of pyramids may be shortened back, always to triple buds, but weak side shoots with only two wood-buds should be left intact until the fruits have set and young shoots are growing freely. Experienced growers are able to shorten each shoot without fear of harm, but those who lack confidence will act wisely in deferring pruning until there can be no question as to the position of the wood buds, one of which must be left at the point of each shoot.

Later Orchard House.—If not otherwise occupied with Chrysanthemums, the later orchard house may be cleansed and put into working order so soon as convenient, as the trees need not be housed before Christmas. It is not too late to re-pot trees, although earlier potting allows the roots more time to become

established in the fresh compost. Maiden trees which were late in ripening may still be lifted, potted up and plunged in open borders, or, better still, placed in the lightest and most airy part of the orchard house. In the selection of Peaches, Nectarines, Pears, Apples, Plums and Cherries for potting, no second-rate variety should be considered, as it is better to have a dozen trees of one good variety than one each of a dozen poor sorts. Pears, Apples and Plums are specially suitable for cold-house treatment.

HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD, Wrotham Park, Barnet, Middlesex.

Orchards.—Although the planting of fruit trees may be carried on with success from now onwards until the end of March, weather permitting, November is the best month in which to do the work. If planting is to be done on a large scale it is advisable to push forward the work so fast as possible so that much of it may be completed before frosty weather sets in; the early-planted trees usually start into growth early the following spring, whereas those transplanted late in spring make much slower growth and need careful attention, especially if the weather should prove cold and dry. As previously stated, the site for new orchards should be carefully selected, with good drainage, and the soil suitable for growing first-rate fruits for a great number of years. The larger-growing varieties should be allowed ample room to form good specimens; indeed, fully thirty feet should be allowed from tree to tree, and the stems, worked on the wild Crab or free stock, should be quite six feet high. If the site chosen is in a somewhat bleak position, Damsons may be planted on the outer lines, from ten to fifteen feet apart, to form a screen.

Mixed Fruit Garden.—With the object of aiding any one desirous of growing mixed fruits on a reasonable space, I suggest that standard Apples be planted thirty feet apart, Plums fifteen feet, dwarf or bush Apples or Pears, seven-and-a-half feet or—instead of bush Apples—Gooseberries, and Red and Black Currants may be planted at suitable distances. Such a fruit garden, if well managed, will yield good crops for many years. Varieties of all the kinds selected should be chosen carefully and purchased from a dependable firm.

Morello Cherries.—Now that most of the leaves have fallen, pruning and regulating the branches should be completed before the cold weather sets in. If the trees have been well trained and are evenly balanced, it is not necessary to remove all the branches from the walls. Keep the heads of the trees moderately thin and spur foreright shoots back to within a few buds of the base. Put plenty of lime-rubble in the soil when planting new trees.

PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NAIL-CAIN, Brocket Hall, Hertfordshire.

Canterbury Bells.—*Campanula Medium* var. *calycanthema* is a useful plant for the decoration of the conservatory or dwelling house, and where the plants have been raised from seeds sown as previously advised, they should now be placed in their flowering pots. Receptacles from seven inches to ten inches in diameter will be the most suitable; they should be clean and well-drained. Canterbury Bells will succeed in any average soil, with a little bone-meal added. When potted, place them in a cold frame, plunging the pots up to the rims in ashes. Remove the lights on every favourable occasion, using them only during wet weather and severe frosts.

Perpetual-flowering Carnations.—The perpetual-flowering Carnation is one of the most desirable plants to cultivate for producing a wealth of bloom during the winter months, and a good point in its favour is that the flowers last well in water. Plants that have been

grown outside during the summer months and were taken inside as recommended in a previous calendar, should now be producing flowers in plenty. They should be assisted by frequent applications of soot-water at the roots. Provided the receptacles are well-filled with roots, an occasional sprinkling with a suitable Carnation manure will afford further assistance. Although excessive feeding is a mistake during the dull winter months, it is essential that fertilisers be applied frequently, but in small quantities, to obtain a succession of brightly coloured flowers. At this time of the year a little extra care is needed in watering, but at the same time the roots should never become dry, otherwise the blooms will suffer. Admit air both day and night, whenever the outside conditions will permit; in fact, the top ventilators should never be closed tightly, unless there is severe wind or frost. A minimum temperature of 50° is sufficient, but rather than cause too dry an atmosphere by excessive heating of the hot water pipes during times of severe frost, the temperature may be allowed to fall to 46°. Rust is often a source of trouble and is encouraged by a humid atmosphere.

Potting Materials.—It is always advisable to have sufficient potting materials in store for the winter months, such as loam, leaf-mould, peat and burnt earth. If these are stored now in an open shed the work of potting will be greatly facilitated. Failing an open shed, the materials should be protected from heavy rains by covering them with boards or felt.

THE FLOWER GARDEN.

By JOHN COUTTS, Assistant Curator, Royal Botanic Gardens, Kew.

Outdoor Chrysanthemums.—So soon as these pass out of flower, or have to be cleared away to make room for other plants, they should be boxed up in sufficient quantity to provide a stock of cuttings for next season. They are best wintered in cold frames, or at the foot of a warm wall.

Protecting Tender Plants.—Material should be collected for protecting tender plants. For shrubby subjects this may consist of mats of various sorts, or canvas sheeting, in a form that may be handled easily, as it should only be used when really necessary. For other subjects, cut evergreen branches are suitable; Furze branches are excellent, as also are straw and Bracken, but whatever material is used, it is of the utmost importance that it keeps as dry as possible and is permeable to air; any protecting material that lies close and wet is likely to do more harm than good. Ashes may be placed over bulbs and tender herbaceous plants. Mulching Roses and other plants with manure with the idea of protecting them from frost generally does more harm than good. Roses are best protected by drawing soil up round the base of the stems.

Rose Planting.—If Rose beds have been prepared as advised in a previous calendar, they should now be in good condition to receive the plants. So far as possible, planting should be done during November, but where circumstances may have prevented the preparation of planting sites, one need not hesitate to plant at any time during the winter and spring, provided always that the weather is open and the soil in good-working condition when planting takes place. If for any reason it is necessary to plant during the spring, the plants should be pruned back at the time of planting. When Roses—or, indeed, any plants—are received from the nurserymen, they should be unpacked at once, checked over and carefully laid in until they can be planted; if the roots are dry when they arrive, they should be dipped in water before heeling them in. Never leave the roots exposed for any length of time, for Roses, more than most woody plants, suffer quickly from root exposure; plants that arrive with their growths at all shrivelled should always be looked upon with suspicion. Strong-growing Roses should be staked.

FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF AILSA, Culzean Castle, Maybole, Ayrshire.

Early Peaches.—The foliage on trees of early varieties of Peach and Nectarine has now reached maturity, and the fall of the leaves may be assisted by drawing a brush lightly along the shoots; as the trees growing under glass are protected from the autumn winds, which under outside conditions soon strip the ripening foliage, no damage follows this method. The trees should then be pruned, removing all exhausted and weakly shoots, and leaving the trees well furnished with plenty of young medium-sized growths, that were tied down during the growing season. Where the trees have reached the limits of the trellis to which they are fastened and no further extension is prac-

be top-dressed with good loam mixed with lime-rubble and bone-meal; in the case of well-established trees, an application of four ounces of basic slag and two ounces of sulphate of potash per square yard will prove an effective winter top-dressing.

Storing Bedding Plants.—Store tubers of Dahlias in any frost-proof shed or loft, where they may be examined readily at frequent intervals. Begonias should also be stored in a dry place in boxes of sand, while Gladioli, if not completely ripened, may be lifted with their foliage intact, and laid out in a sunny shed to dry off, when they should be cleaned, sorted and laid away dry for the winter. In the milder districts it is unnecessary to lift Gladioli; experience has proved that in sandy soils the corms survive

FIG. 169.—CHRYSANTHEMUM MRS. KEITH LUXFORD.
N.C.S. First-Class Certificate, November 3. Flowers chestnut-red, with golden reverse.
Shown by Messrs. Keith Luxford and Co. (See p. 393.)

ticable, careful selection of the shoots must be made, removing those which have already borne fruit and cutting them back to a suitable junction, and retaining only those young shoots necessary to fill up the spaces, without shortening them in any way. So soon as pruning has been completed the branches should be carefully tied into bundles, and the house thoroughly washed down with hot, soapy water, working this into every crevice and corner where insects or their eggs may be in hiding, and afterwards swilling all down thoroughly by means of a hose pipe or garden engine. When the house has dried, the trees should be thoroughly cleansed and if red spider has been troublesome they should be washed with Gishurst compound diluted to the proper strength; rub the mixture well into every crevice and allow it to dry. The walls and brickwork should then be cleansed and given a fresh coating of lime-wash, to which may be added some flowers of sulphur. When all is thoroughly clean and dry the trees should be tied into position. The borders should then

the winter unharmed, and this season the bulbs so left flowered earlier than those lifted and replanted in April. On heavy, wet land, Gladioli deteriorate rapidly and should be lifted. Herbaceous Lobelias, *L. cardinalis* and *L. fulgens* varieties, may also be left in favourable places, but it is always a safe plan to lift and store a few plants in order to ensure stock for another season. Many varieties of early-flowering Chrysanthemums also survive our ordinary winters outside, but in order to provide a plentiful supply of cuttings early in March a few stools of each variety should be lifted, boxed, and kept in a cool house, such as a vinery, at rest, where they will be safe from attacks of slugs. Old bedding Pelargoniums may also be lifted, and either potted or boxed, and kept somewhat dry all the winter, as such plants provide plenty of cuttings that root speedily in heat in early spring. Calceolarias that have given satisfaction during the summer may be potted up to provide a further display in the greenhouse early next year.

ALPINE GARDEN.

THE ALPINE TOADFLAX.

Of all the *Linarias*, or Toadflaxes, probably the most charming in the eyes of the majority of flower-lovers is *L. alpina*, the Alpine Toadflax, a gem of the first water, indeed, and one held in high esteem wherever it is grown. Although it may withstand the winters in certain districts and in the milder parts of the country is a true hardy perennial, in a great proportion of gardens it is best treated as an annual. I was much interested to observe that the late Mr. Farrer appears to have found it tender in Yorkshire, as, in an old catalogue of his nursery at Clapham in that shire, he listed it as a "self-sowing annual." In my own case, north of the Tweed, and in a mild part, I have found it perennial in regard to withstanding the effects of average winters, but it succumbed when these were severe, so that it was necessary to raise plants

white variety with an orange palate, called *L. a. alba*, but as seeds are not procurable it should be propagated by cuttings.

To grow this Toadflax well it should have a light, gritty, well-drained soil and a sunny place. It does well in crevices of the rockwork and will sometimes live there when killed on the level. I consider the best results are obtained by sowing the seeds very thinly, in May, where the plants are to bloom, and thinning the seedlings to about three or four inches apart. But seeds may also be sown in pots or boxes under glass from March until June and the seedlings planted out in early June. Such plants should bloom the same year.

EUPHORBIA MYRSINITES.

Few flower lovers will admit of possessing much affection for the *Euphorbias*, and in the rock garden there are only one or two species with any claim for entry to the realms of choice subjects. Yet many people like to have

wax-like, pure white fruits, so like pearls as to justify the popular name. It seems to like a rather light soil and is increased by cuttings or by sowing the berries in pots under glass. It may be added by way of caution that *M. setosus* may be lost in a severe winter.

SPHAERALCEA MUNROANA.

ABOUT twenty years ago, I was beguiled by a glowing description of *Sphaeralcea Munroana*, known then as *Malvastrum Munroanum*, to purchase a plant and place it in a rocky mound in full sun. It gave much pleasure the first year, survived a mild winter, and then departed this life. A second trial was no more fortunate, and it caused me to turn my thoughts towards the many other alpine flowers of more reliable constitution. But others more fortunately placed in the way of climate may have better fortune, and this trailing plant may be commended to them for consideration when planting alpine in spring. With me it never grew to great length, and its trailing shoots were not more than eighteen inches long, whereas Mr. Reginald Farrer, who called it "a useful but rank Malvad," spoke of it having stems a yard or so long. His epithet of "rank" was modified by the after-praise he gave the plant for hanging over a cliff, or other high place. However, one can only write of a plant as one has grown or seen it, and there was nothing rampant about *S. Munroana* in the all-too-brief periods I had it, and I appreciated its rather grey, Ivy-like leaves and bright scarlet flowers, Mallow-like in their aspect. It must have a dry, sunny place and room, either to trail down a bank or over large stones. *C. Munroana* is not common in commerce. Increase is effected by means of seeds or division, but the runners may be pegged down and will root.

CORNUS CANADENSIS.

Cornus canadensis, the Canadian Dogwood, is a plant which holds its own admirably in the estimation of lovers of dwarf plants suitable for rockwork or for covering a shady spot with pretty leaves and flowers. The inflorescence is white and the blooms are produced very freely to a height of about six inches. It is a boon to have a plant such as this, which loves a shaded or partly-shaded spot and will cover the ground with its bonny leaves. But the attractions of *Cornus canadensis* do not end there, for in autumn it dons its most glorious garb of colouring, when the leaves assume a wonderful variety of tints and form in themselves a feature of the highest beauty. My plants have coloured well this year, and have been greatly admired. *C. canadensis* is increased by division or cuttings. *S. Arnott.*

GENTIANA SCEPTRUM.

THIS beautiful, autumn-flowering plant is a native of Vancouver Island and the mainland of British Columbia, where it grows in damp, peaty meadows. It belongs to the *Pneumonanthe* division of the genus, and is known on the Pacific coast as the Swamp Gentian. On the west coast of Vancouver Island the plants commence flowering when very young and only three inches high, but they sometimes attain a height of two feet. The larger plants, in the open, are bushy and their several stems may each have a dozen beautiful, bright-blue flowers, all open at the same time, arranged racemously or spicately.

Gentiana Sceptrum, although sufficiently attractive for any garden, asks for no attention from the hand of man, and is therefore a valuable plant to those interested in wild gardening. It established itself in the uncultivated part of my garden when, without any thought of what would happen, I planted a small clump of it by the edge of a shallow well which overflows in autumn. The light, chaffy seeds, of which it bears a profusion, evidently floated over into a meadow, and two years after planting the clump all the vicinity was bright with the flowers of the then small seedlings. Some of them have grown into large clumps now, and the accompanying photograph (reproduced in Fig. 170) shows one about fifteen inches high. *G. Fraser, Uchuelet, B.C., Canada.*

FIG. 170.—GENTIANA SCEPTRUM.

frequently from seeds or, in the case of the better forms, to strike cuttings and keep these in a frame during winter.

Such a lovely little plant is well worth a good deal of trouble, as it is of exceptional beauty. It grows only a few inches high, with pointed, narrow, glaucous leaves of attractive hue, and wonderfully large flowers, yet quite proportionate to the plant; these latter are of an exquisite shade of violet, brightened by a showy orange palate. The whole appearance of a plant, or, better still, a group of a dozen or more plants, is exquisite.

A few varieties are known, and one of these called *L. alpina rosea*, comes pretty true from seeds, which are offered by some seedsmen. This variety has rose-coloured flowers with the orange palate which is such a good feature of the type. Specially pretty forms of the rose-coloured variety should be propagated by cuttings. There is also a variety called *L. alpina concolor*, which has violet flowers, without the orange palate, but this is not so attractive as the others. In addition, there is a

a few plants with characters of their own to differentiate them from their neighbours, and to such *Euphorbia Myrsinites* may be suggested as having some slight claim. It makes no pretension to showiness, but has rather greenish-yellow flowers on long, trailing branches, clad with glaucous-blue foliage. This plant comes from Corsica, which would point to its love for a dry position in sun, and this indeed, is what it requires. It is a plant which seldom rises to more than a few inches high, but it compensates for this by its long, trailing stems. It is increased by seeds or cuttings, but the shoots may also be layered. It is quite hardy, provided that it is in a dry, well-drained position.

THE PEARL BERRY.

DURING October a plant of *Margyricarpus setosus*, the Pearl Berry, was very attractive in my rock garden. It is planted so as to hang over a stone ledge, and, depending from the top, it is remarkably pretty with its deep-green, sharp-pointed foliage, well set with the lovely,

HARDY FLOWER BORDER.**MICHAELMAS DAISIES.**

The perennial Asters occupy an important position among hardy herbaceous perennials as they may be used in such a variety of ways and positions, being equally useful for grouping in the mixed border or planting in open spaces in shrubberies. Many of them may also be grown with excellent effect in the semi-wild parts of the gardens, and especially where the dressed portion finishes and merges into the wilder parts. They are, perhaps, seen at their best when planted or massed in borders backed by trees and shrubs. In such positions the old flower stems should not be cut down—as is too often done—for, if left, these present a mass of warm, brown colour throughout the winter, and are often very beautiful when covered with hoar frost.

Apart from their value in the decoration of the garden, Asters are ideal for indoor floral arrangements, especially some of the more slender-growing species and varieties, the variety Climax, with long, graceful sprays, being particularly good for this purpose. There are few good hardy plants less exacting in their requirements, but at the same time, like most plants, they repay good cultivation. They may be replanted at any time from now onwards until the end of March; some of the strong-growing varieties of the *Novi-belgii* section should be replanted every year. All strong-growing sorts should be given plenty of room and their growths restricted to from four to six, when they will produce flowering laterals right to the ground.

Climax, Henry Adams, Sam Banham, Aldenham Pink, and Pink Profusion, are all good varieties; the smaller *Novae-angliae* section includes the well-known Lil Fardell, rubra, W. Bowman and the fine Barr's Pink and Purple King. The *Amellus* section include some fine varieties, one of the best being King George. With so many new varieties there is a danger that the species may be overlooked, but many of these, when well cultivated, can hold their own with any of the varieties for grace and beauty. Aster Thomsonii and its variety nana are among the most charming of our hardy, blue-flowering plants, remaining in flower for many months. Other species worth a place in any collection are *A. turbinellus*, *A. patens*, *A. Piccolii*, *A. cordifolius*, *A. undulatus* and *A. diffusus* var. *horizontalis*. J. C.

BULB GARDEN.**COLCHICUM RUBENS AND C. LILAC WONDER.**

WITH reference to my note on *Colchicum Daendels* in *The Gardeners' Chronicle* of October 15 (p. 305). I have now flowered two other new *Colchicums*. These are *Rubens* and *Lilac Wonder*. *Rubens* followed about a fortnight after *Daendels* opened its second bloom, and *Lilac Wonder* was the latest to flower, and was just about over by October 21. Of the three, I consider *Rubens* the best, although it is not quite so large as *Lilac Wonder*. It is of a fine red-purple with a white base and tube, and is of better form than the others. *Lilac Wonder* developed an additional segment on each of the three flowers produced, and in every case one segment was rather deformed, which is a serious defect in an otherwise very fine flower. *Lilac Wonder*, which has been the largest of the three, opens a rich lilac, passing off to purple-lilac. Comparing these three with the best forms of *Colchicum speciosum*, then in flower, it may be said that the new hybrids are larger and taller and a distinct advance upon *C. speciosum*. With the exception of *Rubens*, which is of more rounded shape, they lack the refinement of *C. speciosum*, but are much larger in size of flower than *C. speciosum*, *C. giganteum* or *C. Bornmuelleri*. If the other hybrid *Colchicums* are equal to the three I have tried, these flowers will be very valuable additions to our garden in autumn. S. Arnott.

ORCHID NOTES AND GLEANINGS.**PROMENAEA CITRINA.**

PROMENAEA is, by some authorities, retained as a section of *Zygopetalum* and, possibly, the best known of the few species is *P. citrina*. The ovoid pseudo-bulbs are about an inch long, compressed, with acute edges; the oval-oblong leaves, shortly petiolate, are two to three-and-a-half inches long; the short peduncles, rather shorter than the leaves, are usually one- or two-flowered. The flowers are about two inches in diameter, bright citron-yellow, the labellum and column spotted with red.

and upon it—with some other allied species—founded the genus *Promenaea*. If the plant discovered in the earliest years of the nineteenth century by the French traveller, Descourtilz, in Minas Geraes (Brazil) and called *Epidendrum Jonquille* was, as Lindley believed, identical with *Promenaea citrina*, then credit for the discovery of this interesting and very pretty little Orchid must be assigned to him and not to Gardner.

P. citrina is free-flowering, and the bright blossoms, usually produced during summer, are persistent for a considerable period; it is a little Orchid that combines beauty and interest with a quaint appearance. Ralph E. Arnold.

FIG. 171.—*LAELIO-CATTLEYA SUNBELLE* VAR. *SUNSET*.
R.H.S. Award of Merit, November 1. Flowers rosy-mauve, yellow and purple.
Shown by Frederick J. Hanbury, Esq., Brockhurst. (see p. 372).

This decidedly pretty little Orchid is of easy culture and succeeds admirably in the Cattleya house when grown in pans or pots containing fibre and Sphagnum-moss, with a few nodules of charcoal. It thrives best when suspended from the roof, but I have seen excellent examples grown on the side staging. The plants enjoy a liberal supply of water at the roots during the growing season.

The history of *P. citrina* appears to be somewhat obscure, although it is highly probable that the species was first detected by Gardner, on the Organ Mountains of Brazil, in 1837, and from Gardner's specimens, Lindley described and figured the plant as *Maxillaria xanthina*, but afterwards separated it from that genus,

INDOOR PLANTS.**ASCLEPIAS CURASSAVICA.**

THIS native of South America is of considerable interest and beauty. It may be grown from cuttings annually, to form small plants, in seven-inch pots, or it may be grown on year after year, when it will develop into a small shrub.

The bright scarlet flowers are produced on erect, solitary umbels, which are fully developed during July and August. Each blossom is about half-an-inch in diameter, the petals being bent downwards at the tips, which characteristic imparts a graceful and charming appearance to the inflorescence.

A small batch of plants will provide a very attractive feature in the greenhouse or conservatory, if given the correct cultural treatment. The method I have found to be the most successful is as follows:—Cuttings of the soft tips of the young shoots are taken in April, and inserted in pots of sandy soil, which are then placed in a warm propagating frame. Propagation is purposely delayed until April, so that the plants may be kept dwarf. If larger plants are required cuttings may be struck in January or February.

Five cuttings are inserted in a three-inch pot, and when they are sufficiently rooted, they are transferred bodily into a five-inch pot. The plants may be flowered in this size, or they may be transferred into seven-inch pots. If the former method is adopted, it will be necessary to pay strict attention to feeding, as the plants require a liberal diet to keep them in good health. Watering must also be carefully attended to, as they—like the Poinsettia—quickly lose their lower leaves if the roots are allowed to become dry. The compost which I have found to be best suited to them consists of two parts loam, one part peat, and a small amount of silver sand. Peat is preferable to leaf-mould, as the latter is inclined to cause the plants to make sappy growth. Firm potting is essential, and no pinching is required. *G. F. Gardiner.*

PLUMBAGO ROSEA.

This Leadwort is of considerable decorative value, its rosy-scarlet flowers and graceful habit of growth rendering it meritorious as a winter-flowering plant. It succeeds in a stove temperature or a warm-intermediate house, and grows freely in good friable loam with the addition of some rotted manure and sharp sand. Cuttings, procured in early spring, offer a ready means of increase, and are produced abundantly by plants which have been pruned back after flowering. Serviceable plants may be grown in five-inch or six-inch pots, and it is very effective when planted out in a warm house.

P. rosea was introduced from the East Indies so long ago as 1777, and is figured in *Bot. Mag.*, t. 230, the variety *coccinea*, which has larger and more brightly-coloured flowers, being figured in t. 5,363.

The flowers are thin in texture, so that it is of paramount importance to elevate the plants as near to the roof-glass as possible, and so render the sprays suitable for cutting. This *Plumbago* is not suitable for forming a specimen plant, but small-sized examples are very elegant. Planted out, however, *P. rosea* will clothe a wall in a most attractive manner. *R. A.*

FLORISTS' FLOWERS.

SOME OUTSTANDING CHRYSANTHEMUMS.

DURING November and December, Chrysanthemum enthusiasts will be revising their lists of varieties with a view to acquiring others which may add interest to next season's floral display. It is as well to bear in mind the fact that a first-class variety takes up the same amount of room, and requires the same attention during its various stages of growth as one of doubtful quality.

Those who desire varieties which will be useful for cutting as well as for growing into specimen plants should not overlook *In Memoriam*, a dwarf, crimson, Japanese sort of small type; and *Gloriosa*, a golden-amber variety of sturdy growth, and bearing fairly large flowers. These are two of the finest varieties in commerce, and useful for any purpose. Both should be grown without stopping or pinching, and first-crown buds secured. If they are vigorous, the plants will produce from ten to twelve good blooms each.

Mrs. R. F. Felton is another fine introduction. The rich crimson flowers are carried on long, pliable stems, and are of fair size, but remarkably light and graceful. Alfred Durbin bears flowers of similar build to the last-named,

but the colour is terra-cotta. Both varieties grow rather tall. The same good qualities are to be found in *Harmony*, the colour of which is copper and orange. *Blanche Poitevine* should be in every collection, as it is so useful as a pot plant. The pure white, incurved flowers are carried on plants which rarely reach a height of eighteen inches. It should be allowed to break naturally, and be grown in pots not more than seven inches in diameter.

Teresa, of bronze-apricot colouring, is indispensable, and should be allowed to carry about eight disbudded blooms. It flowers in December. Two other varieties which should be grown are *Nero*, crimson, and *Liberty*, crushed strawberry. Neither is a good grower, but the flowers have tremendous lasting qualities, and the latter is unique in colour and very pleasing.

For early flowering, *Salmon Queen* and *Brightness* are splendid. The latter, with its light crimson and gold flowers, borne on plants of perfect habit, is ideal for pot culture and flowers early in October. All the foregoing are useful either as pot plants or for cutting.

Single Chrysanthemums are usually grown for cutting and are popular on account of their lightness and because the flowers last well in water. The larger varieties should be disbudded. *Robert Collins*, amber; *Susan*, rose-bronze; *Bronze Molly* and *Mrs. W. J. Godfrey*, peach-pink, are four of the best among the tall-growing Singles. Some of these are nearly ten feet tall this season. *Margaret Davis*, ruby; *Portia*, terra-cotta; *Sweet Auburn* and *Hilda Shoebridge*, light pink, are good varieties of medium height. *Fantasy*, amber and fawn, a seedling from *Bronze Molly*, promises to become a favourite. It is very free-growing and carries a big crop of flowers of the largest size. *Lady Mary Davey*, scarlet-terra-cotta, and *Mrs. A. Robertson*, pink, are also free producers of flowers for cutting. Both are of medium size and possess a good habit of growth. *Lady Mary Davey* is suitable for sprays or partial disbudding.

Among large Japanese varieties, Mr. T. Slack deserves attention. *Red Majestic* is of similar colouring and, like its parent, is in great demand for exhibition use. *Julia*, bronze-pink, builds up a fine bloom of good quality, and has a nice, dwarf habit of growth, similar to that of its parent, the well-known *Mrs. B. Carpenter*. *Cissie Brunton* is a grand white variety of the largest size. *Yellow Edith Cavell* should be grown for exhibition, but is even more useful as a decorative plant, as it will carry a large crop of disbudded blooms. Mr. T. W. Pockett is a pink variety which has been in practically every exhibit of note since its introduction a few years ago. It is a grand grower and an altogether reliable variety. *Yellow Majestic*, a novelty of last spring, will be largely grown, especially if it proves as robust as its distinguished parent. *Charles Hodgson*, Acton Place Gardens, Acton, Sudbury, Suffolk.

PUBLIC PARKS AND GARDENS.

SWINDON Town Council has approved plans and estimates for laying-out land adjoining the eastern boundary of the county ground as a pleasure ground, at £5,634.

THE Swansea Corporation is recommended by the Parks Committee to authorise the Borough Estate Agent to negotiate for the purchase of land at Tregernydd Farm for a recreation ground.

LEICESTER Corporation is recommended to set apart 168 acres, forming portion of the Braunstone housing estate, for the provision of a new park.

THE Ministry of Health recently held an enquiry into an application made by Yiewsley Urban District Council, for sanction to borrow £3,000 for laying out a recreation ground in Falling Lane, to include the provision of tennis courts, a bowling green, etc.

ROSE SPECIES FOR THE GARDEN.

WITH so many new Roses to choose from, there is a real danger that some of the beautiful Rose species may be neglected for garden decoration, for which purpose many of them are so well-suited, either as lawn specimens for shrubbery borders or for planting in groups in the wilder parts of the garden. Apart from their flowers, many of them are also worth growing for their graceful habit or fine foliage, while others have the added attraction of large and brilliantly-coloured fruits.

Rosa sericea has single white flowers, with four petals arranged like a Maltese cross; it is one of the earliest species to commence flowering and makes a large specimen some fifteen to twenty feet high, and has very fine foliage. *R. omeiensis* var. *ptercantha* was originally described as a variety of *R. sericea*, but has now been separated from that species. This Rose is remarkable for its large, translucent and highly-coloured spines that are produced on the young wood; on the old wood they turn brown, therefore a few old shoots should be cut out every year to encourage strong, new growths to spring up from the base.

R. Hugonis is probably the most graceful and beautiful of all the species for use as a lawn specimen. It grows freely to a height of six or seven feet, and its graceful, arching shoots are well covered with fine foliage. In most seasons the single yellow flowers are produced in great profusion, but as it is one of the earliest of species to flower, the display is sometimes spoiled by spring frosts. This Rose should make a beautiful informal hedge or screen. No pruning is required beyond the removal of dead wood, or a few of the old branches, to prevent overcrowding. *Rosa Moyesii*, a comparatively recent introduction from China, has very beautiful flowers which are followed by brilliant fruits. This species seems to like a heavy soil, and where it grows well it makes a beautiful hedge or screen. *R. setipoda* and *R. Fargesii* are two of the newer Chinese species, and have brilliant, long, urn-shaped fruits. *R. Willmottiae*, *R. Webbiana* and *R. sertata* are all worth growing for their fine foliage and graceful habit.

R. multiflora and its variety *polyantha* are both large, free-growing plants, well-suited to the semi-wild garden or for lawn specimens. *R. spinosissima*, the Scotch or Burnet Rose, is a native of Great Britain, and common on sandy links on the coast. It may only attain a height of about six inches, but will be covered with beautiful, single, white flowers, which appear out of all proportion to the size of the plant. At one period there were over one hundred varieties of this Rose in cultivation. The variety *altaica* is very beautiful; in fact, all the best sorts are worthy of more general cultivation. These Roses grow in the poorest of soil but, naturally, they respond to good cultivation.

R. rubiginosa, the Sweet Briar, is also a native of these islands, yet is rarely well-grown in the garden; it makes an excellent hedge or screen as it stands trimming well. *R. Wichuraiana*, of which there are now so many hybrids, is well worth growing for its glossy, polished foliage, and is an excellent plant for covering dry slopes and banks. *R. rugosa* and its many fine hybrids are well-known, and yet they are not so generally used in the garden as they deserve to be. They make fine lawn specimens, screens or hedges, and are well suited to the semi-wild parts of the garden.

R. rubrifolia should be freely planted, as its beautiful foliage is ideal for many floral arrangements. *R. microphylla* var. *fl. pl.*, *R. pisocarpa*, *R. macrantha*, *R. moschata*, and many other old favourites are still worth a place in the garden. *R. Banksiae*, *R. bracteata*—the Macartney Rose, and one of the parents of *Mermaid*—and *R. laevigata*, are all excellent for warm walls, and should be more generally grown in such positions. My remarks, which apply to only a few kinds will, I hope, direct attention to at least a few of these Rose species, and may be opportune now that the planting season is with us. *J. Coultts, Kew.*

TREES AND SHRUBS.

LOMATIA FERRUGINEA.

I WAS interested in reading Mr. Harrison's note (p. 345) on this choice species, and to see the illustration (Fig. 155) of the fine specimen at Castle Levan, as *Lomatia ferruginea* appears to be a plant whose ornamental value and comparative hardiness are generally underrated.

As a foliage plant, *L. ferruginea* is highly ornamental from its earliest days, but as a flowering subject it will scarcely be seen at its best until twenty years of age. The accompanying photograph (Fig. 172), taken in 1919, shows a specimen planted in its present position here rather more than twenty years ago. This is now fifteen feet tall by twelve feet through, well-furnished to the ground, and standing as a solitary specimen in an open situation where it suffers no injury from wind or frost. Flowers are borne in great profusion each year, and fertile seeds are obtainable in quantity, by which means and also by cuttings, the plant has been freely propagated.

As regards the inflorescence, personally, I should describe the petals as prominently marked with cherry-red or deep rose-pink (not scarlet) on a bright buff ground carried all round the central marking.

A freely-flowered branch from our specimen was shown before the R.H.S. on July 19 last and received an Award of Merit. As regards the Castlewellan plants, with which I have been familiar for many years and which were, I believe, the first to flower in the British Isles, these are now about forty-four years of age and, I can assure Mr. Harrison, are specimens of the typical form, without variation of any kind. Mr. Bean's reference to their habit of flowering may, perhaps, be accounted for by the fact that at the time of his observation their full floral quality was not realised at Castlewellan, and that they were then treated more as foliage plants and pruned somewhat heavily each year, which resulted in the formation of handsome, shapely evergreens, and the suppression of exterior flowering wood. In later years these fine specimens have been allowed to develop naturally, and the defect remarked by Mr. Bean no longer obtains.

In the garden of the late Sir John Ross of Bladensburg, at Rostrevor, in this county, self-sown seedlings are freely found around the base of a matured specimen, where the seeds fall and lie undisturbed in rocky crevices. A similar instance of self-propagation can be recorded from the same garden, in the case of *Eucryphia pinnatifolia*. *H. Armytage Moore, Rowallane, Saintfield, Co. Down.*

HYPERICUM PATULUM FORRESTII.

DURING the past few years *Hypericum* of the "patulum" group have become popular. Perhaps it was the half-hardy tendency of the type which caused distrust among gardeners, but the variety *Henryi* soon proved itself to be not only a great acquisition as regards size of bloom and robust habit, but also because it is as hardy as one could reasonably wish. As *Hypericum patulum Henryi* germinated so freely it soon became distributed widely, but it has now to share popularity with the variety *Forrestii*, named after the collector who discovered it in Hunnan. Young plants and home-saved seeds were distributed from Wisley, at first under number, but it may reasonably be assumed that this fine form is now being sent out under its varietal name.

The flowers of *H. p. Forrestii* are larger than those of its predecessor, and borne with equal freedom, while the growth may be described as strong. Raised from the abundant seeds, which germinate readily, it reproduces fairly faithfully the varietal characteristics. Slight variations in the size of the flowers will certainly be observed, but they are rarely smaller than those of the variety *Henryi*, and are usually much larger and of a fine, golden, buttercup-yellow. Though usually described as summer-flowering the succession is long and will extend from the end of June or early July to September.

The pruning of *H. patulum* and its varieties may consist of cutting back those branches

which have flowered to two to five buds from the base, but excellent results may be obtained by cutting the whole plant back to twelve or eighteen inches above the ground and removing entirely all weakly growths. In the latter case pruning should be deferred until early spring as the buds are apt to break too soon after early pruning, and be nipped by the severe frosts which so frequently herald the first two or three months of the year. *Hypericum patulum Forrestii* received an Award of Merit in 1922 and the Award of Garden Merit in 1924. *L. B. C.*

LIQUIDAMBAR STYRACIFLUA.

OF the numerous deciduous trees which are desirable on account of the autumn colouring of their foliage, this Sweet Gum, from the Eastern United States, ranks amongst the most attrac-

which do not fulfil the general expectations of brilliant autumnal colouring. There is one such tree growing in the woodland at Wisley, growing within a short distance of another good specimen which colours every autumn under apparently similar conditions. In America, the *Liquidambar* inhabits moist and sometimes swampy places, but over here it seems to prefer deep, loamy or peaty soil with a not too abundant supply of water. It is hardy when established, but the growths of young plants are liable to injury by frost. It is best raised from imported seeds, as seeds seldom ripen in this country; if seeds are not available, layering may be resorted to. *A. G. F.*

CRATAEGUS COCCINEA.

THIS is a conspicuous and cheerful-looking

FIG. 172.—LOMATIA FERRUGINEA AT ROWALLANE.

tive. It is the most popular species of a small but scattered genus, and was introduced to this country during the seventeenth century. It forms a stately tree, similar in general appearance to a Maple, and in its native country will grow to 150 feet in height, but in Great Britain it will seldom exceed sixty feet or seventy feet.

The trunk is usually straight and erect, the rather slender branches forming a pyramidal head. They are clothed with attractive, long-petioled, five- or seven-lobed leaves, the bases of which are heart-shaped, while the divisions are acutely pointed and have finely-serrated margins. Thin in texture, these leaves are of a rich, lustrous green colour during the summer months, changing in early autumn to varying vivid shades of orange, scarlet and purple.

Strangely enough, trees are sometimes found

shrubby tree for the woods, flower garden or park during the early days of autumn. It is also very noticeable in late spring when in bloom, as the flowers are nearly an inch across, and produced in packed corymbs, while the leafage is obtuse, serrated, and of a bright green hue. But in autumn the green colour changes to brilliant tints. This season, unfortunately, the winds soon stripped the trees, but the loss gave greater prominence to the beautiful scarlet berries—the brightness of which has merited for this tree the well-known and apt description of Scarlet Thorn. The berries hang in clusters of as many as twelve in a bunch all over the twigs, giving the tree a very bright appearance, especially in sunshine. Trees of this Thorn usually reach a height of fifteen or twenty feet. Old age is, alas! affecting one of the specimens in our park. *C. T., Ampthill.*

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C. 2.

Editors and Publisher.—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Urgent Communications.—If sent by telegraph, these should be addressed "Gard. Chron.," Rand; or by telephone to Gerrard, 1543.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

CHILI AND THE ANDES.

No. 1.—ON THE WAY.

ABOUT a year ago, I decided, quite suddenly, that I would make an expedition to Chili to collect plants—quite soon. I am a great believer in doing things, especially travel, on the spur of the moment, but in this case I found that the "quite soon" part of my programme would be a mistake. It was important to arrive in Chili in early September—the Chilian spring—and even by allowing myself a week or two in which to prepare, and get away, I could not but arrive six or eight weeks late. All I could do, therefore, was to resign myself to the best part of a year's delay, haunted by a morbid dread that something would turn up—a *carte blanche* commission, say, to make the world's finest rock garden, or what not, so as to prevent my getting away in August, 1927. I must confess that he would have been a man of wide vision and a deep purse who could have propounded such a garden as would have tempted me to alter my plans, and, anyway, he did not materialise.

We set sail for Valparaiso, my companion and I, on August 4, on the R.M.S. *Orbita*. Opportunities for horticultural and botanical study on board ship are limited. The flora of the S.S. *Orbita*, when we came on board, consisted of half-a-dozen clipped, pyramid Bays and four hanging baskets of Ferns in the "terrace balcony," *Gladioli* and *Scabiosa caucasica* on the saloon tables, and lordly festoons of *Smilax* draping the front of the cold buffet. A few days out the *Gladioli* and the *Scabiosa* were replaced by artificial flowers, very gay and effective, species unknown. The *Smilax* remained, although at the end of a fortnight its leaves began to wilt. Then I made the surprising discovery that the *Smilax* was artificial. It strikes me as an outstanding piece of realism to have artificial *Smilax* which wilts; a realism equal, almost, to that of the man who kept a series of wigs of assorted lengths, so that by wearing them successively, he gave the illusion of gradual growth—and then a hair cut!

Our first port of call was La Rochelle, where we went ashore for five or six hours. We explored the sea-coast for a mile or so and found plants of some interest and no importance. The best thing was a handsome Thistle-like plant with large blossoms of a lovely tawny-gold. On the six-mile walk from the port to the town of La Rochelle, we passed many gardens, and were very little impressed by them. *Bignonias* were glorious on some of the walls, giving masses of orange and cinnabar trumpets, such as the English climate seldom permits; *Mimosas* and *Eucalyptus* flourished, and there were large specimens of *Paulownia* which, judging by their enormous fruiting trusses, must have been a superb sight when in flower. But the general impression was that, from the gardener's point of view, it was a place of lost opportunities. The town itself, on the other hand, is extremely interesting and picturesque, with its arcaded

streets, and a harbour full of richly-coloured fishing boats and fisher folk.

The Spanish ports of Santander, Corunna and Vigo, were blank disappointments. Our shipping company makes quite a song about the delights of these places in their booklets, and we all expected, therefore, that we should be able to go ashore for a few hours at least. At each of these attractive-looking places we were left guessing and hoping until the last minute, and then there circulated dark rumours of difficult tides and such like—which no one believed—and we "pushed on," a much disgruntled crowd. One American in particular was greatly upset. Having spent a week or two in "doing" practically the whole of Europe, he had chosen this route home to Georgia, instead of going via New York, solely in order that he might "do" Spain by setting foot in one of her ports. My own particular grief was that I had hoped to scurry round the rocky environs of Vigo in the hope of finding *Cheiranthus linifolius* growing wild. The late Cedric Bucknall sent me seeds of this charming lilac Wallflower many years ago, from Vigo, and from that small sending the plant spread and has now taken firm hold in British gardens and British seed catalogues.

After the Spanish disappointments we settled down to the serious business of sports, fancy dress balls, carnival dinners and *not* studying the Spanish language. Spanish is essential in South America. Everyone who goes there tells himself that he will "mug it up" during the voyage, but no one has ever yet been known to do so.

We had a week's run of warm weather and unbroken calm, when life on board was like a strange mixture of Brighton pier, the Piccadilly restaurant, and a very well done children's party. Then, on one heavenly dawn, we came into Bermuda. Here we had six hours ashore, and they were six hours of sheer delight. We landed by motor launch, a four-mile run among very small islands, the sea intensely green and purple and peacock blue. Running close in shore we could clearly distinguish a dwarf *Solidago* growing near the sea, and could hear the shrill song of cicadas. The low-lying mainland was wooded with the Bermudan Cedar (*Juniperus bermudiana*). On landing at Hamilton, the chief town of the islands, we drove straight out to the Government Agricultural Station, where, in the absence of the Director, we met Mr. L. Oglevie, who was most kind in showing us round. At his suggestion, and in his company, we drove on a mile or two, to see one of the few remaining tracts of original Bermudan swamp, untouched, undrained, and in its original wild state. This swamp is perhaps fifteen or twenty acres in extent, and it is good to learn that its owner recognises its scientific interest, and intends to preserve it untouched and undrained. It lay in a little hollow, and we were able to push our way well into its jungle. The most striking features were the native Bermudan Palmetto (*Sabal Blackburniana*), a handsome Palm, twenty feet to thirty feet high, whose large fans rattled strangely when stirred by the wind, and *Juniperus bermudiana*. The Royal Fern (*Osmunda regalis*) and *Osmunda cinnamomea* were plentiful and luxuriant, with fronds nine and ten feet tall, and another striking plant was *Mariscus jamaicensis*, like a nine-foot Rush. As we left this interesting reserve, a cardinal bird flashed across the open. About the sedgy margin were many splendid butterflies—especially a large, brilliant orange fritillary.

The chief industries of Bermuda appear to be the cultivation of vegetables, Lilies and tourists. Owing to the favourable climate, vegetables can be produced all the year round. Celery, Carrots, Onions, Kale, Beets, Tomatos, Lettuce and Parsley are exported, largely to New York, where good prices are obtained. A high standard of quality is maintained by a rigid government inspection. We saw many plantations of Bananas—the delicious Lady's Finger variety—and the Papaw was plentiful, though not ripe. Tourists seemed to be widely distributed, but were most plentiful on the golf courses—of which there are seven.

The cultivation of the Bermudan Easter Lily (*Lilium longiflorum*) has passed through

evil days owing to disease, but thanks to work done by the Agricultural Station, the industry is recovering. The crops are inspected at regular intervals. Some bulbs which Mr. Oglevie showed me were the most superb specimens I have ever seen. We saw a Lily field, but the plants were dormant, and not a leaf, alas! was showing. *Juniperus bermudiana* is a most attractive tree, and appeared to be plentiful everywhere. It reaches a height of twenty feet to thirty feet, with trunks up to some two feet in diameter, and is well furnished with fine, lustrous-green foliage. The timber is valuable in building, being the only wood, I was told, which will keep sound for any length of time when built in direct contact with the local coral limestone. The wood is valuable for cabinet work. Woollen goods are safe from moths when kept in a chest of Bermudan Cedar, but manuscripts and even some printed matter may be seriously affected when kept for any length of time in a box of this wood, becoming partially or even totally bleached by its action.

The most striking flowers we saw were *Hibiscus* and *Oleander*. The single *Hibiscus* were superb, ten-foot and twelve-foot bushes clumps and hedges, hung from top to bottom with countless satin trumpets, six inches across, crimson scarlet, soft cherry-red, or a rich and curious apricot, and with a glowing, silken sheen. The double scarlet variety was less plentiful and quite without charm. A *Convolvulus* (*Ipomoea villosa*) entirely covering and strangling a thirty-foot forest tree in a blaze of sapphire trumpets was good to see, but the best picture of all was a little piece of spontaneous wild gardening in an emerald setting of rough paddock, a few yards from the road. Here was a splash of vivid purple with sparks of orange behind. This piece of brilliant colour was intensified by its lush green setting, by being half-shaded by a giant specimen Cedar, and by a background of white cottages. We scrambled over a low wall to see what plants were making this lovely picture, and found that the purple was *Verbena venosa*—purple at a distance, magenta at close quarters—and the orange was a self-sown *Lantana*. Hanging from the branches of the Cedar were olive-grey-green festoons of a curious, lichen-like *Tillandsia*. The orange *Lantana* was a roadside weed everywhere. The "*Bermudiana*," as it is called locally (*Sisyrinchium bermudiana*), was not in flower, but Mr. Oglevie gave me a pinch of seed which he had collected, and during our drive, by great good luck, I caught sight of seeding plants from the carriage, and stopped to snatch the seeds. *Sisyrinchium bermudiana* is, of course, in cultivation in English gardens. I have grown it at Stevenage for some years, but there seems to be some confusion and doubt about the species, so I have sent seeds home for trial. It will be interesting to see if the true plant from Bermuda is the same as the pretty, clarety-purple-flowered species of gardens. Clarence Elliott.

A DAY IN AMERICA.

NOTHING gives one so sudden a mental jolt as the incongruous. One is made aware of likenesses and differences by means of mental comparison and contrast, and pushed to extremes, incongruity results; as when there is a mixture of the familiar and the unfamiliar.

Of course, it was not really incongruous—were we not separated from England by 3,000 miles of ocean? Yet to see such unfamiliar trees in so familiar a landscape, so to speak, as that of Long Island, was odd. A closer acquaintance suggested that the trees were not perhaps so familiar after all.

New York, in October, was hot, much hotter than London at the same season. The absence of trees was very noticeable—a meagre avenue of not very flourishing Planes, here and there; Park Avenue, "up town," as they say, made efforts to appear green, masses of *Polygonum Baldschuanicum* being grown in a sort of narrow central garden; but I heard that the insatiable demands of traffic would shortly devour even this. Central Park was better. It is a fine place, but ill-kept, and not well stocked with

trees. The grass, however, is green, and there are a few—a very few—flowers.

The absence of flowers, and flower shops, in New York city strikes a Londoner at once. Such shops as there are were poorly stocked, chiefly with evergreens, and a few Chrysanthemums and Roses, which are very expensive. I saw no flower sellers in the streets—another surprise for the Londoner—and flowers were not much in evidence in the houses. At first, one is apt to be astonished at what seems indifference to the beauty of flowers. But, as a matter of fact,

New Yorkers. Theodore Roosevelt is buried there. The country is well-wooded and picturesque, but it was a wet week-end, and I hardly saw it at its best. The woods are full of big-leaved Oak (*Q. alba*), Tree-of-Heaven, Sumach, Hickory, American Elm and Maples. White Poplar and Conifers have been extensively planted, and on the private estates, Barberry, Spiraea, and other good-colouring shrubs. Owing to a summer almost as wet as our own, the autumn tints have largely failed this year, but there were some fine crops of Apples in the orchards.

Before leaving America I achieved a great ambition, by going to Harvard and meeting "Chinese Wilson." Probably I was luckier than most hero-worshippers, for when I met the man who has been an inspiration to plant collectors for a quarter-of-a-century I found him all and more than all I had pictured him. He gave me a most warm welcome, and I spent an enchanted afternoon at the Arnold Arboretum, after it had rained "stair rods" all the morning in a way which even hardened Bostonians found embarrassing.

FIG. 173.—CYPRIPEDIUM CHARDMOORE VAR. ALFRED BRIDGES.

R.H.S. First-Class Certificate, November 1. Flowers green, white, and purple-brown. Shown by Miss A. B. Moore, Chardwar, Bourton-on-the-Water. (see p. 372).

Americans appreciate them greatly, and delight their friends on arrival or departure with bunches of flowers. But the harsh climate of New York is very different from that of London, and flowers there are an expensive luxury. Not everyone, even in so rich a city, can afford to have them yet, and as for street vendors, or even shops, I can only suppose that the extremes of climate, the heat waves of summer and the Arctic blasts of winter, make the preservation of flowers a difficult proposition.

No sooner did I land in New York than I was whisked off forty miles by car to Oyster Bay, on Long Island, the country residence of prosperous

The Silver Birch is quite a common tree in Connecticut, and, of course, I saw many kinds of *Pyrus*, which were colouring better than most trees.

In the woods I noticed Indian Pipe (*Monotropa uniflora*), also called Corpse Plant or Ice Plant; one may see it, perhaps another species, in the rain forest of the Burma frontier, too. *Phytolacca decandra*, the Pigeon Berry or Pokeweed, was another plant I saw in the wet hedgerows. I was warned to beware of handling a certain climbing plant, abundant in the undergrowth, said to be capable of raising a severe rash; but whether I came on it or not, no ill results followed.

Mr. Wilson showed me many of his Chinese shrubs growing well in this severe climate; *Berberis Wilsonae*, the evergreen, low-growing *Lonicera Henryi*, with clusters of blue berries; *Cotoneaster horizontalis perpusilla*, the tree-like *Lonicera Maackii podocarpa* (W.194), and *Acer griseum*. Those who have attempted in vain to raise this last from seeds in England may well turn green with envy to learn that it seeds itself all over the place here.

There is no method of deciding where a plant will or will not grow, except trying. Plants do the most surprising things: who would have thought that *Enkianthus*, for instance, which is

only fairly hardy in Britain, would flourish in Boston? But it does—almost every species. *E. campanulatus* looked particularly happy and healthy. The most magnificent sight in the Arboretum is, of course, the grove of *Tsuga canadensis*. The trees are eighty feet high, at a guess, and ten feet in girth, growing thickly on a steep face; and from a distance they form a great, sombre bank, overlooking the valley.

The hilly nature of the Arboretum is a great feature and adds much to the picturesqueness of the place. Somehow I had expected it to be as flat as Kew, but it is very far from being so; indeed, it is a goodish climb up to the highest point. Mr. Wilson drew my attention to the value of procuring selected geographical forms for a given climate. The ordinary Cedar of Lebanon, and the Deodar are not hardy at the Arboretum. Nevertheless, there is a small grove of *Cedrus Libani* here—the plants were brought from the Taurus mountains, and have proved perfectly hardy. Of course it might easily have been the other way on, so whimsical is plant hardiness and adaptiveness, but here practice was for once consistent with theory.

A day at the Arnold Arboretum, and in the magnificent herbarium only serves to whet the appetite. I saw something of the almost

to prevent its increase by restraint in distributing plants and cuttings which are either infested or have been grown in houses where the midge is prevalent.

The appearance of this insect is of considerable interest; the midge has been known in this country for some years as an inhabitant of the wild Ox-eye Daisy. In 1915 it became established probably after exportation from Europe, in the United States, upon the cultivated Chrysanthemum, and has been a pest of importance there ever since. Yet in Great Britain the first record we have of the Chrysanthemum being attacked is in April, 1927.

Though the variety Monument, imported some three years ago from the United States, is certainly susceptible to attack, and, with one exception, the midge is present on all nurseries so far examined where this variety is grown, there is no absolute evidence that the present outbreak is due to infested cuttings brought to this country from America.

The cause of the trouble is a small, slender fly about one-fifteenth-of-an-inch in length, the female (Fig. 175) of which has a deep orange, and the male (Fig. 174) an almost black body. The flies may be seen resting upon the topmost foliage or stems of glasshouse plants, but the pest is more evident from the galls

seven weeks. There is a period of inactivity both during the winter and summer months, but increase takes place from February to June, and again during September and October.

CONTROL MEASURES.

As no known insecticide will reach the larvae or pupae within the gall, killing the eggs and adults must be resorted to. The latter are readily destroyed by sprays containing nicotine, but control can only be effected if the upper foliage of plants is sprayed twice a week during the periods of activity. The following mixtures have been recommended:—forty per cent. nicotine-sulphate, one part to five hundred parts water; ninety per cent. commercial nicotine, one part to four hundred parts water. In either case a good horticultural potash-soft-soap should be dissolved in the spraying water at the rate of half-an-ounce to every gallon. As the nicotine persists upon the foliage for some time, many adults are killed as they emerge from their pupal cases. In the United States, measures based on these lines have undoubtedly kept the pest in subjection where carefully applied. When plants are cut back, all the parts removed should be burned, together with any plant refuse. Cuttings should always be taken from recently sprayed plants, and they should be rooted in a house entirely separate from stock plants. Cuttings, after rooting,

Female, $\times 16$.

complete Conifer collection, and I also saw a consignment of Mr. J. Rock's specimens from Kansu; he, by the way, has just gone off to China again, though not on botanical work this time. Another old Kewite I met is Mr. Judd, who has been at the Arnold Arboretum a dozen years, and shows no signs of having had enough of it. I venture to think that no English botanist, traveller or collector who visits the Arnold Arboretum but will want to return again and again at every season of the year, particularly so long as Mr. E. H. Wilson is Keeper. F. K. Ward.

THE CHRYSANTHEMUM MIDGE.

GROWERS of Chrysanthemums are notified that the Chrysanthemum Midge (*Diarthronomyia hypogaea*, F. Löw) has, for the first time, been recorded as doing considerable damage to Chrysanthemums grown under glass in Hertfordshire and Essex.

The midge is a real danger to the industry, and as the small fly, which is responsible for the trouble, cannot travel over long distances, growers who are so unfortunate as to have the pest already upon their nurseries can do much

made by the grubs upon both surfaces of the leaf and also upon the stems (Figs. 176, 177). These galls are about one-eighth-of-an-inch in length, stand out at an angle from the leaf surface, and do not resemble in any respect the working of the common Chrysanthemum leaf-miner.

For an exceedingly good account of the biology and control of the Chrysanthemum midge, we are indebted to Mr. C. C. Hamilton (*Bulletin* No. 269, University of Maryland Agricultural Experiment Station, U.S.A., August 1924). The bulk of the information given below is extracted from this paper.

The fly lays numerous oblong eggs at night and in the early morning upon the young leaves and stems only in the vicinity of a growing point. Within twenty-four hours after hatching, the minute larvae bore into the leaf or stem surface and later cause a swelling of the plant tissues round them and the formation of a gall. When full-fed the larva changes to a pupa within the gall, through the free end of which it eventually breaks. The adult fly escapes from the pupa, leaving the white pupal skin projecting from the exit hole.

The average length of the stages in glass-houses is as follows:—Egg, five days; larva, four weeks; pupa, two weeks; adult, one-and-a-half day. The total life cycle lasts roughly

should be examined for galls once a week, and if any galls appear, the leaves upon which they occur should be removed and burned.

PRESENT POSITION OF THE PEST IN GREAT BRITAIN.

The Chrysanthemum Midge probably occurred for the first time last April. Remaining dormant during late spring and summer, there has been a serious increase during September, so that plants on some nurseries have begun to show distortion from the great number of galls on leaves and stem.

The varieties chiefly attacked are Monument, Cheshunt White (Enfield White), Mrs. Barrell, and Everlasting. A few other varieties growing in heavily infested houses have shown only a very slight attack.

Plants grown outside during the whole summer and autumn on infected nurseries have shown no sign of galls, except in one case of Monument, where a few galls were present on young plants.

Growers of Chrysanthemums will materially assist in keeping down this serious menace to their industry if they will at once report the occurrence of the pest upon their nurseries to the Experimental Station, Cheshunt, Herts. Infested material should not, however, be sent with the notification. Edward R. Speyer, *Entomologist, Experimental and Research Station, Cheshunt, Herts.*

THE GENTLE ART OF GARDENING.

GARDENING may, perhaps, be defined as the preparing of the place, and the assembling and growing of plants, and all that pertains

foundation for friendship. It may be added that gardeners make good husbands, whilst in spite of all they suffer they are not irritable, like artists, journalists, and literary people. Gardeners do not murder their wives, nor do they commit

suicide. Their chief drawback is that they bring a good deal of mud into the house. Gardening puts old and young on an equal footing; for the experience of "the old hand" is not offset by the superior strength, energy and boldness of the beginner.

There is no rigid plan to follow in beginning a garden. The owner may have only imperfect notions as to what can be done with the site, which is only to be explored by actual trial. Thus, our curate has a pretty knowledge of plants. He began with a sloping, virgin field where sheep had grazed. He dug somewhere and put in an alpine. It thrived. The process was repeated at another spot. These isolated features were gradually combined into a coherent whole—a pleasure to the curate and his parishioners. This illustrates the spirit of one method of approach.

If at first you feel overwhelmed by the unlimited choice of plants, let your range of selection be restricted by some arbitrary means, such as the alphabet. Thus the bed along by the wall shall be furnished only with plants whose generic names begin with G, another with A. Here are some of the G's (a letter not as rich as some in forms): Garrya, Gaultheria, Genista, Gunnera, Gagea, Galanthus, Gladiolus, Galtonia, Galega, Gentiana, Geranium, Geum, Gypsophila, Gaillardia, Gazania, Gilia, Glacium, Gnaphalium. These offer plenty of problems to the gardener—cultural and artistic—with reasonable hope of succession through the year, and suitable combinations of form and colour. Owing to the restrictions imposed by the method, it becomes necessary to exploit fairly fully the possibilities of particular genera, and no garden will suffer from a few cases of this sort of elaboration.

Does a botanist make a good gardener—a more successful gardener than his uninstructed neighbour? From his knowledge of plant forms and plant requirements it might be expected that he should, and doubtless the knowledge accruing at Rothamstead and other stations is becomingly remunerative. Still, much of the outfit of the successful cultivator is still empirical, and we hardly know why we fail or succeed. A bright intelligence will, in gardening, as in other fields, carry you further than much stored learning. Still, a knowledge of botany, of the form, range and classification of plants, and of their behaviour in their natural habitats, adds enormously to the breadth

FIG. 176.—GALLS, WITH MIDGES EMERGING, ON LEAF OF CHRYSANTHEMUM CHESHUNT WHITE.
(Natural size, see p. 388).

thereto. One of its greatest charms is that no garden need be like any other—either in the selection of plants grown, or in their arrangement; there is unlimited scope for individual taste and experiment.

The pursuit is a pleasant one and reacts happily on the body and mind. The attention which the successful cultivation of plants demands, the rhythm of tillage, and the gentle feeling of exhaustion which culminates at tea-time, these, in combination, tend to produce a serene mind, proof against the ordinary vexations of life. Others seek to drown their troubles in alcohol, or gambling, but the happy gardener gets relief without detriment to his health or pocket.

Nevertheless, the gardener exposes himself to trouble from many sources. He is at the mercy of rain, wind, slugs, mice, birds, early frosts, weeds, late frosts, jobbing gardeners and growers, who profess to supply him with plants true to name! There is no limit to his sufferings, and yet I have never heard of anyone who abandoned gardening on any of these pretexts. At the same time, these plagues provide him with an unlimited number of excuses wherewith to explain his frequent failures.

The garden which you want is always very different from the garden which you get. One has to learn toleration. It is better to make a garden of which you do not wholly approve, than to antagonise your family. Thus it comes about that a garden is also a sports ground where levelling conflicts with contours; a Cabbage patch; a menagerie shared by some or all of the following—rabbits, tortoises, dogs, cats, children, peacocks and guinea pigs. It is often also a drying ground.

Among the assets of gardening, apart from the indulgence of your fancy, may be reckoned the many friends you make. The common joys and sorrows of the gentle art make a sure

FIG. 177.—CHRYSANTHEMUM CHESHUNT WHITE WITH GALLS OF THE MIDGE ON UPPER FOLIAGE.
(Reduced $\frac{1}{4}$; see p. 388).

of view and to the enjoyment of the gentle art; whilst in special lines, especially propagation and breeding, it is still more important.

Nothing is more wonderful than the responsiveness of plants when treated properly. Most of us have to learn how to grow each separate species by repeated trial, but occasionally the faculty is instinctive.

A friend of mine met with indifferent success until he had the happy inspiration of asking

line broad, linear, very obtuse or subtruncate and notched at the apex, bright yellow on both sides. Stamens erectly spreading in a ring; filaments pale yellow; anthers darker yellow. Stigmas 7-8, widely spreading, about 2 lines long, plumose, acute, pale yellowish-green. Capsule sub-globose, with a high dome-like top, 3-5 lines in diameter, with 7-8 valves and cells.

Swellendam Division: at Sevenfontein,

Imported plant; natural size.

his wife to indicate where seedlings should be put, and getting her to put them out. He then began to get prizes at local shows. His wife had perfect hands and was rapid to observe; she could tell in a few hours whether a plant would thrive, where most people would require a week. Her special gift became known to her friends and they brought her sick plants in pots to be cured. The secret of this "nursing home" was that a given plant would be placed experimentally in a particular position, and my friend's wife would recognise in half-a-day whether it was recovering; if not, its station was changed till the patient was suited. She claimed no special powers—merely certainty and rapidity of judgment.

Should anyone crave for a new departure in gardening, let him take up the cultivation of a sand dune and a salt marsh. This means the acquisition of a suitable sector of the shore line, and there is no happier environment. In this happy spot he will gradually assemble every dune and marsh plant from temperate latitudes all the world over. And such as he can acclimatise he will grow mingled with the native plants in the most natural manner possible. This field is hardly explored at all and is full of promise. F. W. Oliver.

MESEMBRYANTHEMUM.

(Continued from p. 370.)

1. *G. arrectum*, N. E. Br., in *The Gardeners' Chronicle*, 1922, Vol. LXXI, p. 9, Fig. 5. (Figs. 178 and 179).—Leaves 2-3 (rarely 4) pairs to a growth, with the pairs crossing one another obliquely, suberect or ascending-spreading, usually more or less curved, 2-3 inches long, 3½-5 lines broad near the base and 3-4 lines thick, variable, sometimes somewhat cylindric and more or less flattened on the upper or inner face, or semiterete, or more or less trigonous, usually without but sometimes with a keel on the back, acute or subobtuse, smooth, glabrous, light green, not at all glaucous nor dotted. Flowers subsessile or on pedicels 1-2 lines long and 1½ line thick. Calyx 4-lobed; lobes 3-4½ lines long and as much in breadth, broadly ovate, obtuse, all with membranous margins. Corolla 2-3 inches in diameter, cup-shaped, expanding in sunshine, scentless; petals about 50, in one series, lax, 12-16 lines long, about 1

Fig. 178 is from a photograph taken in South Africa by Dr. Pole Evans of the plant sent to me

FIG. 179.—GLOTTIPHYLLUM ARRECTUM, N.E. BR.
The same plant as in Fig. 178, after cultivation for several months.

as it grew there, and Fig. 179 (reproduced from *The Gardeners' Chronicle*, Vol. LXXI, p. 9) represents the very same plant after I had cultivated it for several months, from a photograph taken by my daughter. These two figures well illustrate the difference that sometimes occurs between these plants as they are seen in a state of rest under natural conditions, and as they are seen in this country under cultivation.

2. *G. difforme*, N. E. Br., in *The Gardeners' Chronicle*, 1922, Vol. LXXI, p. 22.—Growth or branches more or less decumbent, with about 3 pairs of leaves to each and the pairs obliquely crossing one another. Leaves mostly 1½-3 inches long, sometimes longer, ¼-½ inch broad, semiterete, flat or slightly concave on the face, very convex on the back, and usually with, but sometimes without, a hump or tooth on each margin above the middle, the longer leaf of each pair with the apex produced beyond the flat face into a compressed acute or blunt point, and the smaller leaf simply acute or obtuse, deep green, pellucid-dotted; according to Haworth, some of the leaves have a slight twist from above the middle, and some of them are tipped with a soft, straight, curved or hooked bristle or apiculus. Pedicel very short, 4-angled thickened upwards and indistinguishably passing into the calyx-tube, which together with the pedicel is represented in the figures as about 9-12 lines long. Calyx irregularly 4-angled, 4-lobed, the larger lobes sharply keeled, the smaller membranous. Corolla 2-2½ inches in diameter; petals lax, in about 1 series, 9-10 lines long, ½-¾ line long, yellow.

Mesembryanthemum difforme, Linn. *Sp. Pl.*, ed. 1, p. 487, partly, as to *M. foliis difformibus*, Dillen. *Hort. Elth.* p. 252, t. 194, f. 242 (not 241), and Haw. *Obs.*, p. 169 (1795) not of Salm Dyck nor Berger.

South Africa: Locality unknown, in cultivation before 1732, according to Aiton.

This species is unknown to me, and the above description is compiled partly from Haworth's original description of it, and partly from the Dillenan figure, and an original drawing of the plant in the Kew collection.

It seems to be similar to *G. semicylindricum*, but distinctly differs by its short 4-angled pedicel.

The two figures in Dillenius, *Hortus Elthamensis*, t. 194, mentioned above, were considered by Linné to represent one species, but Haworth

retained the name *M. difforme* for Fig. 242, and gave the name *M. semicylindricum* to the plant represented at Fig. 241, which distinctly differs by its more terete and longer pedicels. The plant figured by Salm Dyck as *M. difforme* I now find is merely a form of *G. semicylindricum* and not a distinct species as in my former account of this species I was inclined to suppose. N. E. Brown.

(To be continued).

NOTICE OF BOOK.

Economic Fruit Farming.

DURING recent years a considerable impetus has been given to the study of agricultural economics, and the results obtained have proved helpful to farmers. This, however, is not the case with land devoted to fruit farming, and, therefore, a publication,* which is claimed to be the first of its kind, dealing with the economy of a fruit farm leads us to hope that this important branch of production may, in the future, receive more attention from the economist than it has in the past.

It is obvious that in order to arrive at definite conclusions of widespread application, the results from a large and representative number of fruit farms should be obtained. In this case the results are from one farm only, but the information emerging from the enquiry will prove of the greatest value. Though, in many cases, limited in their application, the conclusions which refer to such subjects as marketing will be of universal importance.

The farm under review is situated in east Norfolk, a district where fruit-growing is still in its infancy. Little is known of the possibilities of Cherry, Plum and Pear growing, and the development of this new industry has mainly been along the lines of soft fruit growing. Strawberries, Raspberries and Black Currants have formed the main crops. The latter have been widely planted, and this part of the country now forms one of the most important Black Currant growing areas in Great Britain. The soil is derived from two formations, the Norwich Crag and the Glacial Drift. That derived from the former is a coarse sand and is less retentive of moisture than that from the glacial loams and gravels. It might be expected that growing fruit on such land would not be a commercial proposition, even though the rainfall of twenty seven inches is slightly higher than the average for the eastern counties. That it can be done, the authors point out, is due to bands of silt which hold up the surface water, and where these do not exist, to a relatively high water table. A slightly higher rainfall in July than the average for East Anglia must also assist.

During the years 1925 and 1926 the yield of Strawberries proved considerably higher than the average of the country. A profit of £48 and £9 per acre was obtained. The lower return in 1926 may be accounted for by the difficulties of marketing owing to the strike, by the lower quality of fruit owing to bad weather at the time of marketing, and because of a lower yield due to frost. Black Currants, which are usually taken after Strawberries, left a profit of £8 and £17 per acre. Many varieties have been tried on this farm and interesting data have been obtained. In the main, the tendency is to plant as great an acreage as possible of Baldwin, though it is pointed out that there are several disadvantages to growing only one variety.

Apple growing is only just emerging from the experimental stage, many varieties having proved unsuitable to the soil of the locality, while very few are satisfactory. With the low yields, far below the average, it is only in years when the price of Apples has been high that it has been possible to make a profit. In 1925 there was a loss of over £12 per acre on fifty-one acres, but the 1926 crop left a profit of nearly £4 per acre.

Mr. Wright and Mr. Carslaw devote considerable space to marketing, and their investigations have been the more complicated by the many units of measurement employed in different markets. The *Report on Fruit Marketing*, recently published by the Ministry of Agriculture, has shown how the buyer would welcome a standardisation of packages and purchase by net weight. That selling by net weight not only assists sales but probably improves the price is a conclusion arrived at in the report under review. An interesting analysis of the cost of marketing from plant to market, shows that, in the case of Strawberries, the cost of picking and marketing the crop is almost equivalent to

the cost of growing it up to the picking stage. Since the cost may fluctuate two to three shillings per hundredweight on account of railway freight, it is all important to the grower to study the prices obtainable in the different markets in conjunction with the relative cost of transport to these centres.

The provision of large quantities of manure necessary for fruit growing is always a difficulty that has to be met. In this case, two-thirds of the manure is produced on the holding by pigs, and the remainder bought. Green manuring has been tried with only moderate results, since considerable difficulty has been experienced in obtaining a good germination of the catch-crop owing to the dryness of the soil. Mulching with litter has been tried but proved unsuccessful. Folding pigs in the orchards has been adopted, but the success of this system largely depends on the degree of management. Pigs kept in orchards require careful treatment and do not readily fatten, and thus there must be a considerable store period before the animal is fit for the market. For pork production the system is not sound, but this is not the case with pigs to be fed for bacon during the following winter. The sales of pigs have consisted almost entirely of fat bacon pigs, and very satisfactory profits have been obtained during the two years, owing, no doubt, to the high prices ruling at that time.

Information of interest is contained in the table of farm assets. The total value, excluding landlord's capital, amounts to £8,000, or £60 per acre, a figure nearly four times as high as that for East Anglian arable farms. The average output per acre for the two years was £20 17s. 6d., as compared with £6 19s. 7d. from an arable farm.

To fruit growers, an enquiry of this nature must prove helpful, and will, we hope, afford a stimulus for the elucidation of the many problems with which the industry is faced. To the economist the enquiry is of special interest, for it is the first investigation of its kind that attempts to deal with the many difficulties, which are far greater than those met with in costing ordinary farming undertakings. W. R. P.

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, Ante pp. 131-137).
(Continued from p. 371.)

ENGLAND, S.W.

HEREFORDSHIRE.—The Strawberry crop here promised to be a heavy one, but the drought which lasted in this district for upwards of two months, prevented the fruits from swelling, although rain fell later and they improved somewhat. There has been a good average crop of fruits here, with the exception of Pears and Plums, but the quality, generally, has been good. Our soil is a rather cold clay. J. B. Cooke, *Ledbury Park Gardens, Ledbury, Near Hereford*.

SHROPSHIRE.—Our season is usually rather late on account of our very heavy soil on a subsoil of clay. The show of blossom in the spring was remarkable. We had 10° of frost on April 30, and the only tree that suffered was Astrachan Red Apple. All other fruit trees are clean, well-set and growing strongly. The fruit trees here are sprayed regularly with a popular brand of insecticide. During the past few years I have paid special attention to spraying and feeding Black Currants, and other small fruits, which have compensated us for the extra labour. Four years ago, we had a new stock of Black Currant Boskoop Giant, which this season was free from big bud, and carried a wonderful crop of first-class fruits. Roger F. Jones, *Oteley Gardens, Ellesmere*.

—All fruit trees flowered exceptionally well, but owing to cold winds and frosts, Apples and Pears are not average crops. The following varieties are bearing fairly well:—Apples: Frogmore Prolific, Mere de Ménage, Warner's King, Emperor Alexander, Bismarck, Ecklinville Seedling, Lane's Prince Albert,

Crimson Bramley, Winter Nonesuch, Blenheim Pippin, Charles Ross and Worcester Pearmain; Pears: Doyenné du Comice, Emile D'Heyst, Beurré Bachelier, Louise Bonne of Jersey and Catillac. Apple Lord Suffield set well but the fruits have dropped badly. The earlier blooms of Strawberries were entirely spoiled, but with the development of more genial weather followed by rain, the later blooms set well, and the plants showed no sign of the disease which is causing so much anxiety in many gardens. Raspberries set well and there was a heavy crop of well-developed fruits. Black and Red Currants were also very satisfactory. Plums set badly and Damsons were a complete failure for the second year in succession. This garden is situated very high, is sloping, and exposed fully to the west. The soil is a sandy-loam on a subsoil of clay. George Robinson, *Gannow Hall Gardens, Welsh Frankton, Nr. Oswestry*.

—Apples and Pears blossomed well, but 17° of frost spoiled the prospects. Plums and Damsons set well, but late frosts left their mark. Black Currants were a good crop. A. Wardle, *Loton Park Gardens, Alberbury, Near Shrewsbury*.

—There were prospects of a splendid crop of fruits, but the disastrous April frosts shattered these prospects, with the exception of bush fruits, which were able to withstand them. Strawberries suffered very severely. Caterpillars have been unusually scarce this season. The soil is a very deep, tenacious boulder clay, bad to work and difficult for plants to become established in. E. F. Hazelton, *Yeaton Peverey Gardens, Bomere Heath, Shrewsbury*.

WORCESTERSHIRE.—The fruit crops generally are extremely partial, plantations in some places carrying heavy crops, whilst near-by, but in low-lying situations, there is an absolute failure of Apples, Pears and Plums. Raspberries have been a very good crop, the showery weather suiting them. Bramley's Seedling Apple appears to have suffered the most. William Crump, *Oakridge, Richmond Road, Malvern Link*.

—The fruit crops in this district are very disappointing, although Gooseberries, Black Currants and Raspberries were very plentiful. Of Apples, Charles Ross, Worcester Pearmain, Lord Grosvenor, Warner's King, Lord Suffield and Lane's Prince Albert are carrying good crops, but Pears are very scarce. Our soil is of a fairly heavy nature. Ernest Avery, *Finstall Park Gardens, Bromsgrove*.

—The fruit crops in this district are disappointing, after the splendid show of bloom. The severe frost on April 29 did a lot of damage in the surrounding district, but this garden escaped, the thermometer only falling to freezing point. Apples Charles Ross, Lane's Prince Albert, Peasgood's Nonesuch and Allington Pippin, carried good crops, while Beurré Rance, Louise Bonne of Jersey and Conference are our best Pears. Strawberries were of good quality and the variety The Duke cropped heavily, but the season was a short one owing to the heavy rains. Loganberries and Raspberries had very good crops. The soil is heavy on a clayey subsoil. John Melrose, *Davenham Gardens, Malvern*.

WALES.

CARDIGANSHIRE.—All fruit trees in this district flowered profusely, but the early and late flowering varieties have set the best crops. The weather was not so favourable for the mid-season trees. The following fruits are bearing good crops.—Cooking Apples: Bramley's Seedling, Lane's Prince Albert, Annie Elizabeth, Newton Wonder, King's Acre Pippin, Bountiful and River's Early Codlin. Dessert Apples: Beauty of Bath, Gascoyne's Scarlet Seedling, Christmas Pearmain, Mr. Gladstone, Duchess Favourite, Charles Ross, Worcester Pearmain, and Langley Pippin. Pears: Williams's Bon Chrétien, Thompson's, Pitmaston Duchess, Autumn Nelis, Souvenir du Congrès, Conference, Beurré de Arenburgh, Triomphe de Vienne and Clapp's Favourite. Plums: Victoria, Czar and Coe's Golden Drop. The soil here is heavy and wet, overlying slaty rock. W. Phillips, *Derry Ormond Gardens, Llangybi*.

(To be continued.)

* *The Economy of a Norfolk Fruit Farm, 1923-26*, by C. W. B. Wright, M.A. (Lecturer in Horticulture) and R. McG Carslaw, M.A. (Dip. Agric. Econ.), University of Cambridge, Department of Agriculture, Report No. 7.

FRUIT REGISTER.

APPLE CARDROSS GREEN.

CARDROSS GREEN is a kitchen Apple, large and round, green in colour, as its name implies, with white flesh. It is juicy, keeps until the end of June in splendid condition, and cooks well. During the past eight years I have worked a stock of seven hundred Apple trees, 125 varieties in all. The garden is on gravel and canker is rampant. I have now selected six varieties that have proved their worth, and Cardross Green is the only kitchen Apple I shall grow in the future. This variety has stood out alone as being the best cropper. When the grafts are twelve months old the little trees bear fruit. I have not at any time seen this variety in a nurseryman's list. My father grew it in the north many years ago, and the crop never failed. The difficulty I have had up to now has been to procure (from eight trees) enough growths for grafting purposes. I feel sure that if Cardross Green will grow and flourish here, it will grow anywhere, and ought to be much more widely known by gardeners who are desirous of obtaining a first-class Apple that crops every year.

The other varieties that have done well are Laxton's Superb; this is a grand dessert Apple, and I sent fruit of it to London last season at the end of May. Lord Lambourne comes next on the list, and until Messrs. Laxton's have something better, I am growing these two varieties extensively. Rosebery crops splendidly each year. Lastly there are Rival and Allington Pippin. These six are the only varieties that have cropped each year. Many other varieties carry a crop once in three years; therefore, so soon as I found the above six varieties were fruiting every year, I started to clear the other sorts, and so I propose to continue the work. A. Allardice, Burwarton, Bridgnorth.

PLUM ISABELLA.

THIS variety is but infrequently planted and should, I feel sure, be given greater attention. In a west-country garden, trees growing against a west wall rarely fail to carry a good average crop of fruits of first-rate quality. This Plum bears fruits of medium size, obovate; skin deep dull red, paler where shaded, and occasional dots of a darker colour are displayed. The flesh is yellow, very rich and juicy and adheres to the stone. The tree is of moderate growth, the shoots downy; the fruits ripen in early September.

Dr. Hogg, in his *Fruit Manual*, states that Plum Isabella was raised by Mr. Thomas Plumley, of Ashton, near Bristol, about the year 1824, from seed of Red Magnum Bonum. It was first brought into notice by Mr. George Lindley, when he was employed in the nursery of Messrs. Miller and Sweet of that city. Ralph E. Arnold.

VEGETABLE GARDEN.

MUSHROOMS.

WHEN collecting manure for making up Mushroom beds we have retained much of the short straw. If the latter has been well saturated with urine and beds requiring about two cart-loads of material are to be made, this practice has invariably proved satisfactory. The bulk as collected would consist of about half manure and half straw. Small beds made on the same principle have not given such good results. The reason for this is, I think, that the straw becomes too dry.

The temperature of such beds remains too high for spawning for a considerable time. During this period evaporation is rapid, and while the surface of the bed is in a suitable condition of moisture when the spawn is inserted (and remains in this condition for some time), the centre and bottom of the bed become too dry owing to the amount of strawy matter employed. This experience has been obtained in dealing with a Mushroom house in which the atmosphere

is inclined to become too dry owing to its situation and the materials used in construction. Owing to the shortage of suitable manure, the collection of the material in sufficient quantities is rather a prolonged business. To prevent undue loss of ammonia a little loam is mixed with the manure. I am aware that some growers add the leaves of Beech and Oak to the material for the making of Mushroom beds, to increase bulk, but I have not tried this method. C. Ruse.

HOME CORRESPONDENCE.

[The Editors do not hold themselves responsible for the opinions expressed by correspondents.]

Exogonium Purga.—A tuber of the Mexican Jalap was planted in July last year in a bed, mainly of leaf-mould, on the north side of an old Quince tree. A special mixture of peat, leaf-mould, loam, sand and broken crocks, was put round it to make it comfortable, and a square foot or so of ground was marked with stones put edgewise, so that it might run no risk of disturbance. Growth began soon and continued until winter. In May, this year, two shoots were observed above ground, and through the summer and autumn the twining stems have been running into the tree and interlacing themselves with *Tropaeolum speciosum* and the large white *Convolvulus*. The leaf and stem are, indeed, much like those of the *Convolvulus*, though darker, and with a touch of brown, and it is as well to point out to zealous weeders which is which. Now (October 31), the *Convolvulus* has died away and the *Tropaeolum* is following it, but the Jalap is as fresh as ever, and has celebrated the departure of the month by producing its first flower. This is also like that of its neighbour, the *Convolvulus*, but is of a warm, rosy-purple, a charming flower for the November garden. I believe that it should bloom earlier; perhaps the fact that it receives little direct sunshine accounts for its lateness. There are many buds still to open if the weather will give it a chance. Fortunately, to-day has been fine, so this handsome Mexican plant may have received a favourable impression of the climate to encourage it. *Exogonium Purga* (*Ipomoea Purga*) grew well in Canon Ellacombe's garden at Bitton. I regret to add that *Mutisia decurrens*, planted close by, to run into the same Quince tree, and assisted with an even larger proportion of broken crocks, has failed after making a hopeful start. W. R. J., Cornwall.

Judging at Flower Shows.—Anent "Nurseryman's" article in *The Gardeners' Chronicle* of October 29, I may state that he is not the only one to find fault with the erratic way in which some classes are judged. At a recent exhibition it was necessary to call the attention of the judges to their decision in a plant class. The error was adjusted as speedily as the mistake was made, but a perusal of the rules governing the class would have prevented a mistake. Those entrusted with the judging were experts, so that it can only be surmised that they were in a hurry. *Nemo Naxitur Tempus*.

Tall Sweet Peas.—"J. T. W." (October 8) wonders whether any readers have Sweet Peas taller than his. Ours were from thirteen feet to fourteen feet nine inches high. They were grown on stakes and disbudded until about August 10, after that date they were not disbudded, or they would probably have been taller. The first blooms were picked at Whitsuntide, the last during the first week in October. Some of the early flower stems were twenty-two inches long and one stem had eight blooms. The seeds were sown in three-and-a-half inch pots, during the first week of January and the plants were set out early in April. F. Jackson, Brancaster, Kings Lynn.

Solanum crispum.—This beautiful member of the Potato family is one of the finest hardy plants for training up a wall. Early in June I saw a particularly fine specimen, about sixteen feet high smothered with bloom, growing against

one of the buildings of the Mental Hospital at Knapsbury, in Hertfordshire. It was planted some years ago in a small pocket of soil, between the base of the wall and a cement path, by Mr. Jennings, the Garden Superintendent, and he is justly proud of the success of his "Potato Tree" in this not too congenial position. The bluish-purple flowers normally open about the middle of May, and are not fragrant. The calyx is campanulate and five-toothed; the corolla is also five-cleft, and slightly rotate. The leaves are simple, about three inches to four inches long, usually ovate in shape, and crisped or curled along the margins. It is from this character that the plant obtains its specific name. During the same visit in early June, I also noticed a fine example of the Tulip Tree, *Liriodendron tulipifera*. It was growing in a lawn in a sheltered enclosure, and, writing from memory, I should say it was forty feet or more high. The widely-spreading branches, clothed with the peculiar leaves, were covered with large, plump flower buds just about to open. I was sorry not to see the specimen in full bloom, for one too rarely comes across such a well-grown specimen of this hardy deciduous tree. R. K.

Apples in a Scottish Garden.—In many parts of Galloway, Apples and Pears are grown remarkably well. The climate along the shores of the Solway Firth is good, and the soil suitable. In the beginning of October, I had the pleasure of visiting the gardens at Balmae, Kirkcudbright. Balmae was for many years the home of the late Countess of Selkirk, and is now the residence of Mr. and Mrs. Duncan, who are both enthusiastic horticulturists. A large number of single cordons and bush Apples have been planted during the past five years, and some remarkable crops were obtained this season. I was told, however, that the crops were even better in 1906. I propose to confine my remarks to the wall cordons. They were exceptionally healthy; the fruits of all varieties remarkably clean, and the colour equal to that obtained in the south. Cox's Orange Pippin was carrying a heavy crop of good-sized fruits; it crops well at Balmae, and, of course, is in great demand for dessert. James Grieve I have never seen finer; the fruits were large and of grand colour, while the flavour was delicious. There were still a few fruits left on several cordons of Lady Sudeley, and although I have known this variety all my life, and have always looked upon it as one of the easiest of all varieties to name, it was some considerable time before I could name it. I never saw anything approaching these specimens for size and colour. Since visiting Balmae, I have received a few notes on the weights of some of the crops. Six cordons of Charles Ross, each averaging eighteen fruits, gave a weight of 60 lbs. 12 ounces. The heaviest fruit was 12½ ounces, and the average weight 9 ounces. Golden Reinette is a great favourite here; it crops well and the flavour is excellent. Ellison's Orange was carrying a very fine crop of beautiful fruits; it is considered one of the best and one of the most reliable dessert varieties. Superb had a nice crop, and I was told that it makes a much better bush than Cox's Orange Pippin, and is much healthier; the flavour is equal to that of Cox's Orange Pippin; in fact, it has already been named the "Cox of the North." It is preferred to Lord Lambourne. Cutler Grieve, although cropping well, and colouring beautifully, is not looked upon with much favour. The American varieties have been tried at Balmae but, so far, have been utter failures; some varieties have made excellent cordons, but the fruits have never approached the excellence of the British varieties. Cooking varieties were very good. Encore, Bramley's Seedling, Lane's Prince Albert, King Edward, Warner's King and Ecklinville were all bearing heavy crops. Mention must be made of Peasgood's Nonesuch; although a very shy bearer, it produces enormous Apples, and one specimen I saw turned the scales at 19 ounces. Several examples of Rev. W. Wilks were equally as large, but not nearly so heavy. The magnificent crops, and the splendid condition of the trees, reflected the greatest credit both upon the owners and their skilful gardener. Solway.

SOCIETIES.

NATIONAL CHRYSANTHEMUM.

NOVEMBER 3 AND 4.—That there is no diminution in the great popularity of the Chrysanthemum was abundantly evidenced at the annual show of the National Society, held at the Royal Horticultural Hall, Westminster, on these dates. The hall was filled with Chrysanthemums and there was an enormous attendance on the opening day. Thanks to the admirable arrangements, which made the show run so smoothly, it was possible to open the doors before the advertised time, and the hall was quickly filled with enthusiasts. There was a record attendance throughout the afternoon and well on to the evening the hall was crowded—often, uncomfortably so—and progress was exceedingly slow. This is one of the penalties of success and not to be avoided, even under the best management. No doubt the new and larger hall will be available for the next Chrysanthemum Show.

As to the flowers themselves, it was agreed by those qualified to express an opinion that the quality of the leading exhibits reached a high standard of excellence. Indeed, it would be difficult to imagine finer exhibits than the twelve vases of Japanese blooms shown in vases by Captain R. B. BRASSEY, or the thirty-six blooms staged on boards by the Society's President, the Hon. Sir JOHN WARD. The Experimental Class, in which the Society provided show boards allowing a space of ten inches from bloom to bloom, was an unqualified success. The seven exhibitors staged magnificent blooms whose beauties could readily be admired.

As will be inferred from the above remarks, the large Japanese varieties were well represented at the show, but there was rather a falling off in the number of the Singles and, in the competitive classes, the dainty little Pompon varieties were absent. That these pigmies of the Chrysanthemum world have charm and decorative value was abundantly clear in the delightful vases of them in Mr. H. J. JONES's magnificent trade exhibit. The old-time incurved varieties were shown in fair numbers in the various classes, though it was interesting to note that better specimens were shown in vases than on boards.

Thirty-five varieties were submitted to the Floral Committee, who granted six First Class Certificates and wished to see again Gordon Curry, a large Japanese variety somewhat of Mrs. George Monroe, junr., type and colouring. This variety was shown by Mr. E. H. PEARCE, Long Sutton Gardens, Basingstoke.

FIRST CLASS CERTIFICATES.

Blackpool.—This is a splendid exhibition Japanese bloom. The narrow, flattish florets hang gracefully, making a deep, compact flower of great value for the show board as well as for house decoration. The colour is a rich, velvety-crimson, with a slight shading of maroon and a golden reverse.

Southampton.—Another excellent Japanese variety of large size. The long, broad florets, which curl gracefully at the tips, are of bright yellow colour. Both varieties were shown by Mr. H. WOOLMAN.

Monument.—A large, Incurved, Japanese variety of the best exhibition type. The broad florets are milk-white.

Mrs. Keith Luxford.—An exhibition Japanese variety of considerable depth. The long, drooping florets are of bright red-chestnut colour and have golden reverses (see Fig. 169, p. 381). Both varieties were shown by Messrs. KEITH LUXFORD AND CO.

Edith Seymour.—A large exhibition Japanese variety with narrow, drooping florets of light chestnut colour and a golden reverse. Shown by Captain J. DALGETY (gr. Mr. Baxter), Lockersley Hall, Romsey.

Charles Davis (1927).—A large exhibition Japanese variety of great value. The bright yellow florets are very long and narrow and are twisted towards the ends, making a graceful bloom of great depth. Shown by Mr. H. J. JONES.

OPEN AMATEUR CLASSES.

Although there were only two exhibits of thirty-six Japanese blooms, in twelve varieties, three blooms of each, shown in vases, the class was one of the chief features of the show on account of the outstanding excellence of the exhibits. The first prize was won by Captain R. B. BRASSEY (gr. Mr. James Quinn), Cottessbrooke Hall, Northampton, with a magnificent exhibit. The blooms were all of great size, of good clear colours and in perfect condition. The varieties in this superb exhibit, were Mrs. B. Carpenter, Mrs. A. Holden, Julia, Rosemary Simmonds, Mrs. J. Gibson, Mrs. P. Murray, Mrs. Gilbert Drabble, Majestic, Duchess of Westminster, Golden Rigby, Norman Chittenden and Victory. The vase of the last-named was considered by many to contain the finest bloom in the show and the whole exhibit was awarded *The Gardeners' Chronicle* Silver-gilt Medal as being the finest in the amateurs' classes. The second prize was awarded to the Hon. Sir JOHN WARD, K.C.V.O. (gr. Mr. C. Beckett), Chilton, Hungerford, for an admirable collection which included splendid vases of Majestic, Mrs. H. Wells, Mrs. B. Carpenter, Red Majestic, Mrs. A. Davis and Major Wheatley.

Five exhibitors set up three vases each of six Japanese varieties in specified colours. The best was from the DOWAGER LADY ANNALY (gr. Mr. D. Cameron), Holderby House, Northampton, who showed Red Majestic, Mrs. A. Davis, Mrs. Gilbert Drabble, Mrs. George Monroe, junr., Mrs. P. Murray and Majestic in splendid condition. Sir JOHN WARD was second, and his best varieties were Mrs. A. Davis, Red Majestic and Mrs. A. Holden. F. C. STORP, Esq. (gr. Mr. G. Carpenter), West Hall, Byfleet, was third in this large class, and he included a vase of particularly good blooms of the richly-coloured Mrs. George Monroe, junr.

The competition in the Holmes Memorial class was not so good as usual, though the two competitors set up splendid blooms. The need for larger show boards was very evident in this class, for all the blooms were of such large size that they were greatly crowded and it was difficult to appreciate their full values. Sir JOHN WARD was first with blooms of great depth and in excellent condition. The disposal of the colours was well done and, except for the unavoidable crowding, the effect was very good indeed. Space does not permit mention of all the thirty-six varieties, though their qualities would warrant it, but we mention the following as being typical of this very fine collection: Victory, Mrs. F. Slack, Mrs. Gilbert Drabble, Tom Abbot, Madame Stuart, Julia, Red Majestic and Mrs. George Monroe, junr. VISCOUNT HAMBLEDON (gr. Mr. W. Turnham), Greenlands, Henley-on-Thames, was a good second in this important class, and his very best blooms were of Mrs. R. C. Pulling, Mrs. Gilbert Drabble, Majestic and Belle Chinoise.

Of the four exhibits of twenty-four distinct Japanese varieties, the best was shown by Captain R. B. BRASSEY, who had particularly good specimens of Dawn of Day, Mrs. A. Holden, Julia, Victory, A. J. Cobb, Golden Rigby and Duchess of Westminster. R. L. V. SHERWOOD, Esq. (gr. Mr. J. Heath), St. Gatien House, Newmarket, was an exceedingly close second, and he had splendid blooms of Majestic, Yellow Majestic, Dawn of Day, Ajax, Mrs. A. Brown, Mrs. G. Lloyd Wigg and Princess Mary.

As we have already mentioned, the Experimental Class was very successful, and no fewer than seven competitors staged their twelve distinct Japanese varieties on the boards provided by the Society. The general quality reached a high standard of excellence, and the class attracted a deal of attention. LADY ANNALY won the first prize with a superb collection. The varieties were Julia, Marjorie Woolman, Melody, Autumn Tints, Majestic, Mrs. E. Tickle, Red Majestic, Mrs. P. Murray, Dawn of Day, Victory, Mrs. A. Davis and Mrs. A. Holden. In his second prize collection, R. L. V. SHERWOOD, Esq., had especially fine specimens of Red Majestic, Mrs. F. J. Fleming, Majestic, Cissie Brunton, Yellow Majestic and Louisa Pockett. Mrs. THOMSON (gr. Mr. L. Barnard), Long Walk House, Windsor, was third in this important class, and included Mrs. C. Swainland,

Majestic and Mrs. Gilbert Drabble of great merit.

The class for six distinct Japanese varieties drew six exhibits. The first prize was won by R. L. V. SHERWOOD, Esq., who staged magnificent blooms of Mrs. B. Carpenter, Red Majestic, Queen Mary, Princess Mary, Mrs. A. Davis and Majestic. Mrs. CONSTANCE PEARSON (gr. Mr. C. Hodgson), Acton Place, Sudbury, Suffolk, was a very good second, showing Mrs. R. Luxford, Majestic, Viscount Chinda and Julia in splendid condition. Col. CHARLES BROOK (gr. Mr. T. Cload), Kinmount, Arran, was third, and he had very good blooms of Majestic, J. W. Pockett and Julia.

The competition was not quite so keen as usual in the classes for three blooms each of specified colours. The best white was Mrs. Harold Wells, shown by Sir JOHN WARD; and Cissie Brunton, shown by R. L. V. SHERWOOD, Esq., second. Mrs. George Monroe, junr., was shown by the first three of the four exhibitors in the class for any crimson variety. W. S. GRAVES, Esq. (gr. Mr. J. Marshall), Newalls, Horsham, was first, and LADY ANNALY was second. Princess Mary was the best yellow Japanese variety, and it was shown by R. L. V. SHERWOOD, Esq., who was first, by Mrs. SOFER (gr. Mr. A. S. Gooden), Amport St. Mary, Andover, and two others of the five exhibitors in the class. There were six exhibitors in the class for three blooms of any other colour, where LADY ANNALY was first with Red Majestic, and R. L. V. SHERWOOD, Esq., was a close second with Majestic.

The Incurved varieties were shown in larger numbers than on recent occasions. S. W. WICKENS, Esq., Southsea, was first with eighteen blooms in six varieties, shown in vases. This was a good class, and illustrated that when well-grown and arranged with taste the Incurved Chrysanthemum has considerable decorative value. Mr. WICKENS, who showed very good blooms, indeed, of Golden Glory and Captain Kettle, was also first with a single vase of Incurved varieties. There were only two exhibits each in the classes for twelve and for six varieties, and G. H. FISHER, Esq. (gr. Mr. T. Finch), Down View, Purley, won both first prizes. F. C. STORP, Esq., was first in the class for six vases of Decorative Chrysanthemums.

There was a falling-off, perhaps due to the lateness of the season, in the exhibits of Single Chrysanthemums, though the quality generally was very good indeed.

In the George Monroe Challenge Cup class, which is for open competition, the exhibits of twelve vases of large Singles made an attractive display. The first prize was won by VISCOUNT HAMBLEDON, who included Augusta, Supreme, Bronze Molly, Sandown Radiance, Phyllis Cooper and Molly Godfrey in his admirable collection. F. J. YARROW, Esq. (gr. Mr. A. Robertson), St. John's Wood, London, was a good second, and he staged especially fine vases of Golden Seal, Sportsman, Mrs. A. Robertson, Susan, Annette and Catriona. The first prize for six vases of Large Singles was awarded to the KING'S ACRE NURSERY Co., who showed very good vases of Mrs. Catlow, Hon Edith Smith and Susan. In the Open Amateurs' Section, F. C. STORP, Esq., set up nine excellent vases of Large Singles, which included Phyllis Cooper, Susan, Eton Scarlet, White Model and Crimson King. F. G. YARROW, Esq., was a good second, and his collection contained Sandown Radiance and Golden Seal of great beauty. VISCOUNT HAMBLEDON was first with six vases of the same type, and of these Catriona, Annette and Molly Godfrey were of great merit; F. C. STORP, Esq., was second. A. E. TAYLOR, Esq., Winchester, showing Florrie King, was first for a vase of small Singles.

The various Decorative classes were well contested and included many tasteful arrangements. F. J. YARROW, Esq., was first with a handsome vase of large Incurved blooms. Miss HEDGES, Sydenham, showed the best basket and the best vase of Small Singles. G. RICHARDSON, Esq. (gr. Mr. J. Vanstone), Tulse Hill, won first prizes with an excellent arrangement suitable for a hall table or a side-board, for a vase of Large Singles, and a bowl of Chrysanthemums. A. TICKLER, Esq., Slough, showing excellent blooms of Mrs. R. C. Pulling,

had the best vase of five Japanese blooms; E. R. CRICK, Esq., Green Lanes, London, had the best large vase of Chrysanthemums, and A. E. TAYLOR, Esq., was first with a handsome arrangement of twelve disbudded blooms of Large Singles.

In the smaller amateurs' divisions the leading prize-winners included Mr. B. FRANKLIN, Stevenage; Mr. J. H. GODDARD, Leicester; Mr. J. CLEMENT, Hampstead; Mr. J. ROWLETT, Sanderstead; and Mr. W. STALEY, Gosport.

For the first time for many years, the FINCHLEY CHRYSANTHEMUM SOCIETY was unable to compete for the Affiliated Societies' Challenge Trophy, which they have won on so many occasions. This year the Trophy was won by the BOROUGH OF CROYDON CHRYSANTHEMUM SOCIETY (Secretary, Mr. Thomas Aley), with an admirable collection of flowers grown by various members. The Japanese sorts included Mrs. B. Carpenter, Mrs. George Monro, junr., Louisa Pockett, Majestic and William Rigby. The Incurved varieties were represented by Ondine and J. W. Streeter, and there were also admirable vases of Anemone-centred Single and Pompon varieties. The FOREST HILL SOCIETY (Secretary, Mr. D. Turner), was second.

NON-COMPETITIVE DISPLAYS.

The wall space around the hall was not sufficient for the demand from the trade growers for their displays so some had to be set out on tabling. These large groups were an imposing feature of the show and attracted a great deal of admiration on account of the excellence of the blooms and the great taste displayed in their arrangement.

Mr. H. J. JONES set up a most imposing display in which all the types were represented by particularly well-grown blooms, and, as usual, great taste was displayed in the arrangement. The large Japanese varieties, which included Majestic, Wm. Rigby, Mrs. H. T. Hirst, Mrs. R. C. Pulling, Princess Mary and other exhibition sorts, were shown in tall stands at the back of the group. In the middle and at the front there were large vases of Red Uxbridge, Rayonante, In Memoriam, E. Reeves and White Ball of the market-sized varieties, while the chief Singles included Phyllis Cooper, Absolute, Crimson Dawn, West Hall Gem, Sandown Radiance, Miss Mary Powell and Oaklands. Several vases of mixed varieties of the dainty little Pompon varieties attracted much admiration, and these included Victorine, Golden Climax, Mary Pickford and Lilian Doty (Large Gold Medal).

In a group which was arranged with considerable skill, Messrs. CRAGG, HARRISON AND CRAGG displayed excellent blooms of the types valued for the highest class market trade. The Japanese varieties included Jean Pattison, rich bronze; Iolanthe, pale pink; Mrs. R. F. Felton, deep crimson; Atalanta, pink; and Fifi, sprays of bright rose flowers. Chief amongst the Singles were Ceddie Mason, crimson sprays; J. H. Blyth, rosy-scarlet, and Clytie, yellow sprays. The Incurved varieties were well represented by J. W. Streeter, of rich yellow colour. (Small Gold Medal.)

A comprehensive collection was arranged by Messrs. KEITH LUXFORD AND CO. This included large Japanese and market Japanese varieties, Singles and a collection of sprays cut from the open ground. The exhibition varieties included Thalia, U.21, of rich crimson colour; Mrs. R. C. Pulling, Lady Findlay and Belle Chinoise. Amongst the Singles were goodly vases of Portia, Everlasting and Cherub. There were also vases of Thora, an attractive mauve, Anemone-centred variety, and Winsome, a bright-scarlet Anemone-centred bloom. (Gold Medal.)

Several very good seedlings were shown by Mr. H. WOOLMAN, while, amongst the exhibition Japanese varieties, he staged Belle Chinoise, Franconia, Aquitania, Mauretania and Mrs. T. Slack. White Ball, a small incurving bloom, Yellow Stewart Smith, Godfrey's Gem, Atalanta, Swardston White, of good market size, and Joyce Strowlger, a mauve Single, were also noteworthy varieties. (Small Gold Medal.)

A considerable space was filled with large plants by Lady MACNAGHTEN (gr. Mr. F. J. Bright), Sandhurst Lodge, Berks. The plants,

which were from cuttings inserted during the second week of last December, displayed very skilful cultivation and they carried a large number of decorative blooms. One specimen of Blanche Poitevine had one-hundred-and-fifty-six flowers. The other varieties were Pink Delight, Jean Pattison, Cranford Pink, Cranfordia, H. W. Thorpe and Gaiety (Gold Medal.)

An attractive collection of market varieties was staged by Mr. A. G. VINTEN. These included Bronze Cranfordia, Fifi, Blanche de Poitou, R. A. Roots and Salmon Uxbridge, of the Japanese varieties, and Everbright, J. H. Blyth and G. Fox-Wilson of the Singles. (Silver-gilt Medal). Messrs. W. WELLS AND CO. were awarded a Silver-gilt Medal for an attractive and representative display.

A large collection set up by the KING'S ACRE NURSERY Co. was arranged the previous Tuesday and, in consequence, had lost most of its freshness. The large Japanese sorts included Majestic, Mona Davis, Mrs. R. C. Pulling and Edith Cavell. Absolute, Felicia, Mrs. George Hutt and Rayonante were also very attractive. (Silver-gilt Medal.)

The value of undisbudded flowers was shown by Mr. WM. YANDELL, who set up pretty vases of Mrs. Phil Page, Delice, Goldfinder, Crimson Circle, Armored, Betty Spark, Harvester and Red Almirante. (Large Silver Medal.)

Silver Medals were awarded to Captain A. H. B. WRIGHT, The Rookery, Marlow, for a splendid specimen plant of Mrs. K. Luxford; to Messrs. J. COLE AND SON, who staged a meritorious collection of representative varieties; and to Mr. H. CLARKE, who displayed a collection of small Japanese and Single varieties.

READING AND DISTRICT GARDENERS'.

At the fortnightly meeting held in the Abbey Hall, Mr. J. R. Lloyd presided.

The subject of the evenings' lecture was "Chemical Manures and their Use and Influence on Plants," and the lecturer was Mr. A. J. Macself, Hamilton Road, Reading, who said in introducing his subject that it was of the utmost importance that the chemist and horticultural worker should work together to obtain the best results. Plants, like children, differ as to their requirements, for whilst a certain food suits one, it may have no effect on another; in fact, it may even do harm. Soils, again, vary, and it is necessary to know something of their texture before applying chemical manures to them. Also no two seasons were alike, and sun and weather play an important part in absorption by the plant. The following manures were touched upon, and their uses and advantages explained, namely, nitrate of soda, sulphate of ammonia, sulphate of potash, muriate of potash, nitrate of potash or saltpetre, sulphate of lime, basic slag, Kainit, bone-meal, dried blood and hoof and horn. The lecturer strongly emphasised the fact that it was necessary to add humus in some form to the soil, if chemical manures are used continuously. A very interesting discussion followed, and a very hearty vote of thanks was accorded to Mr. Macself.

In the competitive and non-competitive sections there were no less than sixteen exhibits. For six Onions, the first prize was won by Mr. A. W. GOWER, The Gardens, Calcot Grange; the second by Mr. T. BUTCHER, The Gardens, Glebelands, Wokingham; and the third by Mr. J. WYNN, The Gardens, Hammonds, Checkendon. For three heads of Celery, the first prize went to Mr. H. BROOMFIELD, The Gardens, Clyffe House, Mapledurham, and the second to Colonel MASCALL, Reading. For six Carrots, Mr. G. CLARK, The Gardens, Dyson's Wood, was the winner of the first prize and Mr. J. WYNN, second. In the non-competitive section, a First Class Certificate was granted to Mr. D. TURNER, The Gardens, Coley Park, for several splendid bulbs of Ailsa Craig Onions, and a similar honour went to Mr. G. CARTER, The Gardens, Chazey Hill House, Mapledurham, for excellent fruits of Best of All Tomatos. Awards of Merit were granted to Mr. F. G. RABBETTS, The Gardens, Bulmershe Court, for Apples; to Mr. A. H. FULKER, The Gardens, Elmhurst, Reading, for Dahlias; and to Mr.

E. COOPER, Conisborough Avenue, Caversham for Chrysanthemums and double Dahlias. The following members staged exhibits of Apples: Mr. C. J. HOWLETT, The Yews, Earley; Mr. A. E. PLUMRIDGE, The Gardens, Wessex Hall, Reading, and Mr. R. HAINES, Calcot.

ROYAL HORTICULTURAL OF ABERDEEN.

THE Annual Meeting of the members of this Society took place in Aberdeen on Saturday, November 5. In the unavoidable absence of Sir Thomas Jaffrey, the President of the Society, Mr. W. B. Clark, Superintendent of Aberdeen's Links and Public Parks, occupied the chair.

Mr. J. B. Rennett, Secretary and Treasurer, submitted the annual balance sheet, which showed a surplus of £109 11s. 3d. in favour of the Society, which was considered very gratifying. In moving the adoption of the accounts, Mr. Clark said it must be very pleasing to all connected with the Society, in view of the disastrous spring and summer experienced during 1927, to learn that their annual show had proved so highly successful. He sincerely hoped that the success was due to a greater interest taken in horticulture by the public, and that the Society would continue to prosper. Mr. Clark paid a warm tribute to the fine assistance Sir Thomas Jaffrey had rendered the Society, and declared that all connected with the Society would agree they could not find a better or more competent President than Sir Thomas Jaffrey. These sentiments were most heartily endorsed by the meeting.

The annual election of office bearers proved a mere formality, the only change made in the directorate being the election of Mr. James Mackintosh in place of Mr. John Kinnaird.

GUILDFORD AND DISTRICT CHRYSANTHEMUM.

THIS Society, formed in 1884, scored another distinct success at its thirty-fifth exhibition, held in the County and Borough Hall, Guildford, on November 3 and 4. There was a large attendance, so much so, indeed, that the large hall was frequently uncomfortably overcrowded.

The entries, 239 in number, exceeded those of last year by eighty-seven. Vegetables were much in evidence, and the ninety-five entries in this section contained some very fine examples. Fruits were much in evidence and of first-class quality; Apples nearly equalled the extraordinary display of two years ago, while Pears and Grapes were likewise excellent.

Amongst the outstanding successes, the President, F. F. SMALLPEICE, Esq., was pre-eminent. He staged twelve exhibits and was awarded seven firsts, four seconds and one third. Another notable achievement was that of Mr. F. W. WESTLAKE (Chairman of the Committee); in the open class for the best collection of Chrysanthemums, eight feet by six feet, he won the first prize and Silver Cup presented by the late Mrs. Hamilton Fellows. Mr. Westlake is an amateur, without professional assistance. For the premier Japanese bloom the award went to Mrs. PAULING (gr. Mr. R. Street), for Red Majestic. The premier Incurved bloom was J. W. Streeter in the collection of J. J. JOICEY, Esq. (gr. Mr. McKay).

The President's Challenge Cup for eighteen Japanese blooms, in twelve varieties, on boards, was won by Major SPENCER CHICHESTER (gr. Mr. H. Hall), in a keen competition with Mrs. PAULING.

The best group of Singles, grown without disbudding, came from F. F. SMALLPEICE, Esq. (gr. Mr. W. F. Binfield); second, L. B. BARON, Esq. (gr. Mr. G. C. Wareham). Singles, disbudded, in vases, were best shown by F. F. SMALLPEICE, Esq.; second, E. S. WHEALLER, Esq. (gr. Mr. A. Simmonds); third, J. J. JOICEY, Esq.

The best collection of nine vegetables, distinct, was shown by The Rt. Hon. LORD RIDDELL (gr. Mr. G. Payne); second, Mr. C. HOLT; third, Mr. C. W. GADD.

For a collection of vegetables, Mrs. FARNHAM (gr. Mr. Binnington) led. In this collection Premier Onions and Leeks were particularly good. Mr. R. S. GREEN and Mr. C. HOLT also

won prizes, while Mrs. FARNHAM had the best dozen Onions, showing Fogwill's Guildford Champion.

In the largest class of Apples (six dessert and six cooking varieties), Mr. E. STEVENS, J. J. JOICEY, Esq., and Brig.-Gen. LONGBOURNE (gr. Mr. E. Churchill), secured prizes as named, in a good competition.

There were beautiful displays of Begonias for which F. F. SMALLPEICE, Esq., carried off the honours, with Gloire de Lorraine; second, LORD RIDDELL. Mr. F. F. SMALLPEICE was also first prize winner with Begonia Turnford Hall.

At a luncheon preceding the opening it was pleasing to hear Mr. Smallpeice generously acknowledge that for the flowers grown and exhibited in his name the credit was due entirely to "My friend, Mr. Binfield, my head gardener, who could not produce the flowers he does without a real love for them." Another indication of Mr. Binfield's enthusiasm and interest in the Society was shown by the fact that he sold over eight hundred tickets of admission before the date of opening.

The Annual Report shows the Society to be in a good position financially, with a credit balance of £104 4s. 1d. in hand.

HIGHGATE AND DISTRICT CHRYSANTHEMUM.

THE fortieth exhibition of this well-known Society was held at Highgate Hall, Highgate, on Wednesday and Thursday, November 2 and 3. Considering the lateness of the season and the early date fixed for the show, the display was highly creditable. The society is fortunate in having so excellent a President as Mr. E. W. Moss-Blundell, and Mrs. G. Saunders as Treasurer; their enthusiasm is largely responsible for the present satisfactory state of the Society.

For a group of thirty Chrysanthemums, in thirty-two-sized pots, one bloom on each plant, Mr. T. MARRIOTT, 57, Hornsey Rise, N., won first prize with well-grown dwarf plants, each carrying a good bloom of excellent form and fine quality. With an edging of foliage plants, this group was very commendable. Second prize was awarded to WATSON SCURR, Esq. (gr. Mr. J. Riches), Warltersville, Hornsey Rise.

In the class for four bush plants, W. H. MILNER (gr. Mr. S. North), Totteridge Lane, Whetstone, N., led with Mr. E. Tickle, W. Turner, Viscount Chinda and Mrs. L. Thorn; second prize was won by W. GIBBON, Esq., (gr. Mr. D. B. Arnot), Beechwood, Highgate.

For three pots of Single Chrysanthemums, Mr. S. NORTH showed well, gaining first prize with good examples of Mary Richardson, Yellow Beauty and Joan Edwards; Mr. J. HUBBARD, 92, Stanley Road, Bowes Park, second.

Excellent examples were shown in the class for six Chrysanthemum plants, one bloom on a plant, grown in a thirty-two-sized pot. A splendid exhibit secured first prize for Mr. NORTH, who showed Queen Mary, Princess Mary and Majestic in good condition. Mr. MARRIOTT was second with a good set, and third prize was awarded to Mrs. BROUSSON (gr. Mr. A. Wakeley), Fenton House, Hampstead, N.W.

There was only one entry in the class for twelve Japanese blooms, distinct. This was awarded first prize, and was from Mrs. KOHNSTAMM (gr. Mr. J. Clement), Middlebank, Hampstead, N.W. Noteworthy blooms were those of Mrs. G. Monro, Dawn of Day, R. C. Pulling, Queen Mary, Julia, Red Majestic, Mrs. A. Davis, Mrs. G. Drabble, Daily Mail, J. N. Inglis, G. C. Chapman and Majestic.

For a vase of Singles the entries made a pretty display. Leading honours went to Mr. T. MARRIOTT, who had a showy exhibit; second prize was awarded to Mr. J. HUBBARD, and third prize to Mr. A. H. CARTER, 90, Stanley Road, Bowes Park.

In the class for three vases of Large Singles, there were three exhibitors, first prize being awarded to Mr. J. CLEMENT, who had a charming set; second, Mr. A. WAKELEY; third, Mr. D. B. ARNOT.

The class for a decoration of Chrysanthemums suitable for a dinner table was well filled, and first prize was awarded to Mrs. CARTER, Bounds

Green, who used Source d'Or effectively. Mr. STANLEY MARRIOTT was second, and Mrs. HUBBARD, 92, Stanley Road, Bowes Green, third.

Pretty and artistic displays were made in the class for a basket of Chrysanthemums, Mr. MARRIOTT leading with yellow and crimson flowers; Mr. J. CLEMENT second, and Mr. A. WAKELEY third.

One of the best competitions was that for sixteen Japanese Chrysanthemums, four blooms to be shown in each vase. A bold effect was made by the first prize set, which came from Mr. J. CLEMENT. Second prize was won by Mr. A. WAKELEY, and third prize by Mr. D. B. ARNOT.

Mr. J. NORTH was a splendid first prize winner in the class for a bowl of ten Japanese Chrysanthemums, his arrangement leaving nothing to be desired. Mr. J. CLEMENT also showed well and gained second prize with good blooms of Mr. R. E. Pulling; Mr. WAKELEY, third.

TRADE NOTE.

MR. W. F. GULLICK, F.R.H.S. (florist and nurseryman, of Salisbury), celebrated the coming of age of his son, Mr. Kelly Gullick, and his entry into the business, by entertaining the staff of his firm to dinner at Salisbury. Mr. Gullick presided, and among those present were Mrs. W. F. Gullick, Miss Barbara Gullick, Mr. Kelly Gullick (who has been in various parts of the country for the past four years preparing for his entry into his father's business), and two members of the staff who had been connected with the firm since its establishment, over twenty-one years ago. After dinner, Mr. W. A. Constable (Manager) proposed the toast of "Our Esteemed Employer, Mr. Gullick," and coupled with it the names of Mrs. Gullick and their son and daughter. He said they had met to commemorate the inauguration of what was now a very progressive business, to honour the coming of age of Mr. Kelly, and to welcome his entry into the business. The staff sincerely and heartily congratulated Mr. Kelly on his coming of age, and wished him the best of health and prosperity. He added that wherever they went in the horticultural trade they would not find a man with a finer personality than Mr. Gullick, their employer.

Mr. C. Francis (foreman) having spoken appreciatively of Mr. Gullick, presented Mr. Kelly Gullick with a handsome, fitted, attaché case, on behalf of the staff. There were also expressions of welcome and appreciation from Mr. C. Randall (who has been with the firm for twenty-one years), Mr. G. Cole, Mr. Fay and Miss Gear.

Mr. Gullick, responding, thanked the company for their hearty reception, and said it gave him great joy to see his staff enjoying themselves. He and his wife had no desire to be looked upon as master and mistress, but wanted to be looked upon as friends, and he hoped that so long as they carried on in business their employees would look upon them as they had always done. They must try to live and work together in harmony and then they would continue to work successfully. Mrs. Gullick and Miss Gullick also thanked the speakers.

Mr. Kelly Gullick said they had done him a great honour that evening, and he thanked those present for their beautiful gift and their expressions of good will. During the last four years he had been in different parts of the country and he had had the opportunity of working among other staffs, and he had now come to enter his father's business.

Miss Goldring (Manageress of the floral department) proposed the "Business House of Gullick," and said she had been with the firm since its beginning in 1906, when they started in the Wilton Road with a little shop. Before long they wanted more land and took some at Pembroke Park and built nurseries there. In 1911, they took a shop in Salisbury, and five years later they took over the Bowling Green, which was in a very bad state, but which was now one of the best nurseries in the country.

She thought they were fortunate in having such a careful and considerate employer as Mr. Gullick. Mr. Gullick, in reply, said it was the firm foundation on which the business had started that accounted for its progress, and he did not see any reason why, with continued care and attention to details, the firm should not go on progressing as it had done in the past. Horticulture, he continued, was not like a manufacturing business; it was subject to weather variations. In 1906 they made a start, and in 1907 he became associated with Mr. J. H. Blizzard and Mr. A. J. Jones, and it was that association with clever men outside his own calling that gave him tremendously broadened views, and he progressed, and was still progressing. Since 1920 there had been a tremendous increase of interest in gardening.

A programme of vocal and instrumental items concluded the proceedings.

Obituary.

William Austin.—We regret to have to record the death of Mr. William Austin, of Comely Bank Nursery, Edinburgh, which occurred with tragic suddenness on October 2, last. Mr. Austin's health had not been satisfactory for some time, but his death came as a great shock to his friends. He was fifty-four years of age, and was for many years connected with the Comely Bank Nursery, and several years ago he became a partner in the firm. His special line was alpine plants, of which he had a very comprehensive knowledge, and of which he was a skilful propagator and cultivator.

ANSWERS TO CORRESPONDENTS.

CORRECTION.—As the result of a clerical error, the name of the author of "The Inheritance of Certain Characters in Impatiens Balsamina" (p. 349) was given as B. S. Bedell, B.Sc., whereas it should have been B. J. Bedell, B.Sc.

LAWN WEED FOR IDENTIFICATION.—N. L. The weed is *Potentilla reptans* (the Creeping Cinquefoil). The root received is several years old, and similar roots could be extracted with a forked spud. These old roots produce a large number of runners every year, but they would come away easily with the central root in May or June. At that season the foliage of the runners could be destroyed with one or two applications of lawn sand or sulphate of ammonia, because the rootstock has little reserve food. In soft ground, or where water is liable to stand in winter or for short periods in summer, this weed may become a great nuisance.

WORMS IN ROCKERY OF ALPINE HOUSE.—H. R. D. The presence of worms in the rockery would indicate plenty of vegetable matter and moisture in the soil, but beyond drawing leaves into their burrows occasionally they would not do so much damage, as in pots, the drainage of which they stop up. Lime-water brings worms to the surface, if a quantity of quick-lime is put into a vessel and allowed to stand for twenty-four hours, and the soil then watered with the clear liquid. An overdose cannot be given, because water will only hold sufficient lime in solution till it reaches saturation point. Lime-water should not be applied to soil containing *Gentians*, *Silene*, *Achillea ageratifolia*, *Campanula alpestris*, and other lime-haters, but otherwise it would not be harmful to rock plants generally. A powder worm-killer could be spread over the soil by hand and water then applied. This would avoid putting it on the foliage, and would seem the safer of the two wormkillers.

MARKETS.

COVENT GARDEN, Tuesday, November 8th, 1927.

WE cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Tuesday by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market and the demand, and they may fluctuate, not only from day to day, but occasionally several times in the day.—EDS.

REMARKS.—After several days glut of Chrysanthemums the supplies are now likely to be less plentiful owing to the return of colder weather. Single varieties are now more prominent, some very fine disbudded blooms and sprays in bunches now being on sale of white, yellow, pink, bronze and crimson sorts. Carnations are somewhat firmer in price this morning, especially best quality scarlet blooms, and no doubt these and white sorts will be in more demand

for Armistice Day. Arum (Richardias) Lilies are considerably more plentiful and arriving in excellent condition. At present there is an ample supply of Lilium longiflorum. L. speciosum album and L. s. rubrum are also more plentiful. Lily-of-the-Valley from home-growers has increased in quantity, and regular consignments of these blooms are also being received from Holland. Single Violets, like Chrysanthemums, have been too numerous, and prices have varied according to quality and condition on arrival here, but the return of colder weather will be more suitable for these blooms during transit. A few spikes of Nerines have been received from Guernsey in good condition.

REMARKS.—There is room for an improvement of the conditions in most sections of the market. Imported Apples are not very plentiful, but even so, there is little or no demand. In the English Apple market the position is similar and prices generally are comparatively low. Rather heavier supplies of Apple Cox's Orange Pippin have been marketed, and although best grades of English cooking Apples are not in ample supply, there is no inclination on the part of buyers to pay good prices. Pears are on the scarce side but sell only moderately well. Choice fruits, such as Grapes and forced Melons, are meeting a slightly improved demand. The English Tomato trade is good for new crop produce, and there are fair arrivals of Canary Island Tomatos also available. Hothouse Beans, after a period of depression, are now a better trade, prices all round being firmer. Some forced Potatos from Guernsey and new Potatos from the Azores are not doing particularly well. Mushrooms remain a steady trade and prices are not showing much fluctuation. Salads, mainly from abroad are selling better. The colder weather should encourage a better enquiry for green vegetables. The Potato trade remains more or less unchanged.

GLASGOW.

Conditions in the cut flower market were depressed during the past week, when prices of Chrysanthemums declined. Supplies were heavy, especially on Friday, when the following low levels were recorded:—White and Yellow Thorpe, 1s. to 1s. 2d. for 6's; Le Pactole, 9d. to 1s.; Almirante, 8d. to 1s.; Phyllis Cooper, 1s. 3d.;

Mearn's Bronze, 1s. 6d.; Exmouth Pink, 1s. 4d.; Blanche Poltoun, 1s. to 1s. 3d.; Delores and Belle Mauve, 7d. to 9d.; Cranford Pink, 5d. to 8d.; Sanctity, 6d. to 8d.; Jean Pattison and Mrs. Roots, 1s. 9d. to 2s. for 12's; Pink Consul, 3s.; seconds 1s. 3d.; Bronze Consul, 2s. 6d.; seconds 1s., and No. 2 White, 1s. 9d.; White Sprays averaged 3d. per bunch. Carnations were firmer at 3s. to 3s. 6d. per dozen; pink Roses, 2s. to 4s.; red, 1s. to 2s. 6d.; white, 1s.; Lilium longiflorum, 2s. to 3s. per bunch; L. speciosum rubrum, 2s.; and Lily-of-the-Valley, 1s. to 1s. 6d.

In the fruit market, American Apples continued scarce and dear, Jonathan and McIntosh Red making 16s. to 18s. per case; Delicious, 17s. to 19s.; Canadian Spies and Russets, 40s. per barrel; Jonathan and Winesap, 35s. to 38s.; Baldwin, 30s. to 33s.; York Imperial, 26s. to 32s.; and Stark, 30s. to 32s. English-grown fruit also advanced in price. A special lot of Lane's Prince Albert realised 24s. per case. Bramley's Seedling was worth 10s.; and Lord Derby, 8s. to 8s. 6d. Doyenné du Comice Pears averaged 17s. 6d. per half-case; Beurré d'Anjou, 27s. per case; Grape Fruits were cheap at 16s. per case; South African Oranges, 25s. to 26s.; Brazil, 26s. to 28s.; Sunkist, 28s. to 31s.; Pomegranates, 16s. to 17s.; Kippen Grapes, 3s. 6d. to 4s. per lb.; English Colmar, 2s. to 2s. 3d.; Almeria, 18s. 6d. to 30s. per barrel; Cranberries, 24s. per case; Melons, 2s. 6d. to 3s. 6d.; Italian Chestnuts, 36s. per bag.

The trade in vegetables was steady to quiet. French Beans sold at 8d. to 9d. per lb.; Scotch Tomatos of a good quality were worth 10d. to 1s. per lb.; Mushrooms, 2s. 6d.; French Lettuce, 1s. 9d. to 2s. per dozen; Scotch, 1s. to 1s. 9d.; English Cucumbers, 9d. to 12s.; Cauliflowers, 2s. to 5s.; Brussels Sprouts, 2s. 6d. to 3s. per stone.

SUPPLEMENT PLATE.

Leptospermum laevigatum.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the past fifty years at Greenwich, 41.9.

ACTUAL TEMPERATURE—

The Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, November 16, 10 a.m. Bar. 30.3. Temp. 46°. Weather, Sunny.

A Botanist in Amazon Valley.

DR. RUGGLES GATES has set a good example* to the present generation of botanists in turning his back for a time on the laboratory and adventuring a little in the wild. We could wish that his example might be followed, for botany is undoubtedly suffering from its neglect of wild Nature. Where now are the books of travel which charm and inspire the present generation like those of Darwin, Wallace and Bates charmed and inspired their own? Those works undoubtedly helped to broaden the outlook of biologists and enabled them perhaps to keep an eye on the wood whilst looking at the trees. It might, of course, be suggested that botanical exploration has been done so thoroughly that little remains to do. Yet, as the wonderful visits of Kingdon Ward and his predecessors to China and

Tibet show, botanical Alexanders—if they exist—need not sigh for the lack of new worlds to conquer. As Dr. Gates records, collectors who know the Amazon Valley will asseverate that Bates and Wallace only scratched the surface so far as collecting goes. Dr. Gates' point of departure for his Amazon expedition was the Brazilian port of Para, a place regarded by Bates "as the most enjoyable on the face of the earth." Although only 1½° south of the equator, the climate of Para is equable and the average temperature not higher than 81° with extremes of 75° and 90°, so that the burghers of this selective city when not going to "the pictures" sit about and sip guaraná, a pink, non-alcoholic aperatif made by pounding up the seeds of Paullinia Cupana. Avenues of Oreodoxa regia and other Palms are numerous. The Mango, (Mangifera indica) from the east has been planted everywhere, and Ficus Benjamina, another eastern immigrant, is a favourite shade tree. From Para our explorer took ship for Manaos, a thousand miles up the river. The great Amazon, of which the Para river is a part, drains two-fifths of South America, and is navigable for ocean steamers for over 2,000 miles, and for boats of shallower draught for nearly 3,000 miles. On the journey to Manaos, the ship skirts luxuriant tropical rain forests, with Palms bordering the river, conspicuous among which are Euterpe oleracea, E. precatoria and Mauritia flexuosa. With them are larger trees, and of these giants Ceiba pentandra the Silk-Cotton tree, from which kapok is obtained, is the greatest. Climbers are to be seen everywhere, as are also clumps of the Aroid, gigantic Montrichardia, with stems six to eight feet high, and further up the river are the great "islands of floating grass," made up chiefly of species of Panicum, and afloat under the lee of the islands are great masses of Eichhornia. From Manaos, which is a hot place, Dr. Gates travelled—still by water—some 370 miles to Teffé. Among botanical objects of interest to which his attention was attracted during this part of the journey was Crescentia Cujete, the Calabash Tree, a small tree with the cauliflorous habit so common with Amazonian trees. In trees of this habit the inflorescences are not borne on young shoots, but as direct outgrowths from the old wood, and even from the main trunk. In the old days when biologists were prepared to find a ready explanation for everything, it naturally occurred to them to suggest that this habit was a device on the part of trees of dense tropical forests, enabling their flowers to meet butterflies or other pollenising insects half-way. Aloft, towering high above the ground, a flower might remain remote, unfriendly, alone—out of reach of insect life, and hence, perhaps, sterile. The "explanation" may, of course, be the consequential conclusion that natural selection arranges all that sort of thing, but such explanations, as well as natural selection itself, are just now out of fashion. Teffé, where Bates spent five years, is referred to in *The Naturalist on the River Amazon* as Ega. It was in this neighbourhood that Bates collected seven thousand species of insects, of which over five hundred were butterflies. He appears, nevertheless, to have left a good many there, for they swarmed numerously and inimically about Dr. Gates of an evening. It is, indeed, still true to say of insects—voici l'ennemi—for they still dispute every inch of the way that civilisation makes in tropical America. Of interesting trees in the forests are species of Couma, of which C. macrocarpa yields latex which tastes like a sweet cream. It is one of several "Cow Trees," the latex

of which is drinkable. Teffé and its neighbourhood were the far limit of the voyage. On the return, Dr. Gates used his powers of observation to good effect, and as a consequence the pages recording the voyage are full of observations of interest. There is, of course, no attempt to give more than an impressionist sketch of the great tract of country which was passed through. Yet the sketch, though slender, is vivid, and should do much to awaken "wanderlust" in the stay-at-home hearts of botanists who confine their observations to their own countryside, and sometimes more narrowly to the contents of bottles with preserved specimens. If that be the effect of Dr. Gates' trip, it will have been made to good purpose.

Leptospermum laevigatum.—Our Supplementary Plate depicts flowering branches of the beautiful *Leptospermum laevigatum* shown by Mr. Gerald W. E. Loder, Wakehurst Place, Ardingly, Sussex, at the meeting of the Royal Horticultural Society, on August 3 last, when an Award of Merit was granted. The flowers are white and of large size for the genus. Mr. Loder writes:—"Leptospermum laevigatum was described in *The Gardeners' Chronicle* of August 6 (p. 118) as coming from New Zealand, but it is not found there, being a Tasmanian and Australian species. In Tasmania it grows to ten feet or twelve feet in height, and is an erect-growing shrub, much branched, spreading, and often drooping in habit. The flowers are white, solitary, and rather larger than those of the well-known *L. scoparium* from New Zealand. The leaves are also rather larger and somewhat glaucous. So far, it has proved quite hardy in Sussex, but it has not yet been tested by a really severe winter. It does not appear to be particular as to soil, but succeeds best in an open, airy situation."

Veronica Trials at Wisley.—The Council of the Royal Horticultural Society is arranging a trial of herbaceous Veronicas at Wisley during the coming season, and invites entries of three plants of each variety, which should reach the Director, R.H.S. Gardens, Wisley, Ripley, Surrey, on or before Saturday, December 17.

Grading and Packing of Apples.—Much has been heard on this subject recently, particularly in connection with the demonstrations of proper marketing which the Ministry of Agriculture has given at various agricultural and other shows. Now, a leaflet of the Ministry (No. 98) has appeared which goes into the whole question of Apple grading, giving the various kinds of packs for use in connection with certain stated packages and the descriptions of recognised market grades for both cooking and dessert Apples. Questions of wrappings for the Apples, the proper labelling of boxes and other details in correct marketing are also discussed in the leaflet, which can be obtained on application to the Ministry of Agriculture, at 10, Whitehall Place, London, S.W.1.

Horticultural Exhibition in Berlin.—For the week from January 28 to February 5, 1928 the Berlin municipal authorities are organising what is known as a "Green Week," in which horticulture will normally play a leading rôle, and all branches of gardening will be represented; the various local horticultural and other societies combining to make the exhibition a success.

Germination of Seed Peas.—The regulations made under the Seeds Act, 1920, require, in the case of a sale of seed Peas, that the seller shall deliver to the purchaser a statement in writing containing certain specified particulars including (1) the name and address of the seller; (2) a statement that the seeds have been tested in accordance with the provisions of the Act; (3) the kind of seed; (4) the percentage of purity, if below ninety-seven per cent.; and (5) the percentage of germination, provided that, if the percentage of germination is not less than seventy per cent., a statement to that effect

* A Botanist in the Amazon Valley, by R. Ruggles Gates. H. F. and Witherby, 326, High Holborn, W.C. Price 7/6.

shall be sufficient. As was the case last year, there are indications that the germination of the 1927 crop of seed Peas is below normal, and that consequently a considerable proportion of the Peas marketed this season will be found to germinate slightly less than the minimum percentage prescribed in the Seeds Regulations. The sale of seed Peas with a germination of less than seventy per cent. is not contrary to the Regulations, provided the actual percentage of germination is declared. To avoid failures in the crop it is advisable that seeds showing on test less than a seventy per cent. germination should be sown rather more thickly than usual.

Lincolnshire Potato Trials.—Some interesting results are disclosed in connection with the trials of twelve varieties of Potatoes which have been carried out this year at half-a-dozen centres in the Kesteven Division of Lincolnshire. The object of the trials was to demonstrate: (1) The cropping powers of certain immune varieties, in comparison with susceptible sorts; (2), the advantage derived from systematic cultivation and manuring; and (3) the value of planting seed from healthy stocks. Scotch seed sets were obtained for the trials, eight varieties being supplied to each grower, who prepared and dressed the ground uniformly with the standard Potato manure supplied. The season has been a peculiar one. Whilst the intermittent rains kept the soil moist, thus supplying the plants' needs, the dull, sunless periods were conducive to blight, and it was found that some varieties, especially the late ones, such as Field-Marshal, and also Arran Chief, were much diseased. The average yield of the twelve varieties at the six centres worked out at rather more than twelve tons per acre all round, with the highest individual yield from King George (18½ tons per acre), which was secured at Freiston. This variety produced on the average 2½ lbs. per root. Field-Marshal, Catriona, Arran Chief, and Great Scot exhibited the most disease in the order named, ranging from forty per cent. to five per cent. of the tubers lifted.

A Black (?) Carnation.—Appropriately enough, the story of the new "black Carnation" comes from Italy. It is that this horticultural wonder was raised by an Italian gardener and named Benito Mussolini. Not to be outdone, another Italian gardener has produced a snow-white Carnation which he has named Romano Mussolini, after the Duse's youngest child. The white Carnation is "a fine double blossom with a stout, firm stem, and penetrating perfume."

Harrogate Horticultural Show.—This annual event, which is held in conjunction with the Harrogate Agricultural Society's show, is fixed for Friday and Saturday, August 10 and 11, 1928. The display of plants, flowers, rock gardens, etc., made this year by some forty different leading trade firms was a revelation to all comers and the show next year is to be still more extensive and attractive. Several Cups are to be given for competition. Col. W. F. Collins, D.S.O. (who is greatly assisted by Lady Evelyn Collins), has been re-elected President for the seventh time, with Mr. George Morrell, Secretary. Mr. O. W. H. Allen is Chairman of the Horticultural section, and the Rev. J. Bernard Hall, Show Manager. H.R.H. Princess Mary Viscountess Lascelles is a patron of the Society, and it is expected she will again visit the show.

Allotments in Leipzig.—In order to encourage the allotment movement in Leipzig, a large piece of ground is being set aside in the course of the town-planning now proceeding, and will be apportioned among those who are desirous of taking small holdings. The planning of certain suburbs has already been completed and permanent allotments have been given a place in the designs. This extension of the ground intended for the purpose named has been largely the work of the local allotments and gardens association and the allotments are to be so arranged as to form part of the general scheme of open spaces for the town.

Our Diminishing Rainfall.—It seems that the world's average rainfall is becoming gradually less, for, according to the tabulated records,

the rainfall has decreased about one per cent. during the last fifty years. Various reasons for this diminished rainfall have been suggested, the most recent and very plausible is that as there is often a film of oil, from ships, on the surface of the ocean this retards the evaporation of the ocean water which is the chief source of our rainfall.

Mr. G. Carpenter.—One of the best known and most successful gardeners in Surrey is Mr. G. Carpenter, who has had charge of the gardens of F. C. Stoop, Esq., at West Hall, Byfleet, since 1896. Although hale and hearty, Mr. Carpenter considers he now belongs to the old school of gardeners. After a brief schooling, he was engaged to mind sheep at a wage of 2s. 6d. per week when he was eight years of age; he remained on the farm for about seven years and the experience gained has been extremely useful to him in later years. While acting as a farm lad he took full advantage of the facilities afforded by the local night school and, meanwhile, cultivated with great success a small flower garden attached to his home. It was this success that attracted the attention of the Rector's wife, who eventually engaged him as

MR. G. CARPENTER.

garden boy. He served this lady for two years and then she secured him a position in Lady Dorothy Nevill's garden at Dangstein, Sussex, at a time when when Mr. James Vair was the gardener and Dangstein was one of the show places in the south. In due course, Mr. Carpenter was employed at Petworth Park, Messrs. James Veitch and Sons' Nursery at Chelsea, and at Messrs. B. Williams and Sons' nursery at Holloway, and afterwards became foreman at Ewell Castle, but his desire for knowledge and experience led him to enter Mr. Jackson's nursery at Kingston, then a famous establishment, but now no longer existing. His next position was that of foreman at Burhill Park, Walton-on-Thames, and in 1880 he became gardener to C. J. Abbott, Esq., at Rydins, in the same district. Seven years later he took charge of Major Collis Browne's garden at Broad Oaks, Byfleet, where he remained for seven years, and afterwards spent short periods with Mr. Norman Davis, then at Camberwell, and at Linden House, Leatherhead. In 1896 he took up the position he has filled so long, honourably and successfully. Mr. Carpenter has won over two hundred prizes for Chrysanthemums, and his success at the recent exhibition of the National Chrysanthemum Society is evidence that his skill has not abated. Equal success has attended his cultivation of hardy fruits, and his awards for these include a Gold Medal from the Royal Horticultural Society, and three Silver Bunyard Medals for collections

of Gooseberries. Apart, however, from his skill as a gardener and exhibitor, Mr. Carpenter occupies a prominent position among raisers of fruits and flowers, and he has to his credit such excellent Apples as George Carpenter, Victory and Comrade; such useful Chrysanthemums as Mrs. A. Holden, General Allenby, Golden Marvel, G. Carpenter, E. Reeves, Sunshine, White Model, Laddie and Mrs. J. Palmer; and Carnations Master Michael Stoop, Freddie Ward and Hercules. The whole of the glass-houses at West Hall have been erected under the supervision of Mr. Carpenter, who has also practically remodelled the whole of the gardens under his control, and not very long ago he planted an orchard of seven-hundred bush fruit trees for the purpose of demonstrating the best varieties to grow in the district. In Mr. and Mrs. Stoop, Mr. Carpenter has sympathetic and keenly interested employers who give him every encouragement to continue his excellent work at West Hall. Local horticultural societies have received great assistance from Mr. Carpenter, who has freely given his services as a lecturer, and has always been ready to give sound practical advice. On several occasions he has lectured to the students at Wisley, and it is one of his deep regrets that owing to doctor's orders he has now had to give up lecturing during winter evenings.

Iris Society.—The fifth annual general meeting of this Society will be held at the Grosvenor Hotel, Victoria, S.W.1, on Wednesday, November 30. The meeting will be preceded by the usual dinner, at 7.15 p.m. (morning dress), 10s. 6d. per head, payable at the table, and those who do not wish to attend the dinner should note that the business of the meeting will commence about 8.30 p.m.

Association of Economic Biologists.—The December meeting of this Association will be held on the 16th inst., at 2.30 p.m., at the Imperial College, South Kensington, when Mr. W. E. Hiley, Mr. R. N. Aldrich-Blake and Mr. L. Chalk will open a discussion on "The Influence of Climate on the Rate of Tree Growth."

Cauliflower Cultivation in Erfurt.—On October 29, the one thousandth railway truck full of Cauliflowers was laden and driven from the goods station, and the occasion was celebrated by a little festival arranged by the local Cauliflower Growers' Association. A gathering of local notabilities, including municipal authorities, station officials, members of the Growers' Association, etc., took place at the station, the waggon of Cauliflowers was decorated with flowers, and speeches were made, in which the enormous development of the Cauliflower industry in the Erfurt district was traced.

British Mycological Society.—The following programme has been arranged for the meeting to be held at University College, Gower Street, W.C.1, to-day, Saturday, November 19, at 11 a.m. Mr. S. F. Ashby, "The Oospores of *Phytophthora nicotianae*, with notes on the taxonomy of *P. parasitica*"; Mr. B. F. Barnes, "On the Production of Variations in *Eurotium*"; Mr. S. Garside, "Method of Reproduction in *Siphula tabularis*"; Mr. R. N. Natrass, "The *Physalospora* disease of Basket Willow"; Mr. J. Ramsbottom, (i) "Mycological nomenclature"; (ii) "Editorial Comments."

Societies and Income Tax.—A law-suit, of special interest to the management of horticultural societies, has just been concluded. The Commissioners of Inland Revenue claimed Income Tax from the Yorkshire Agricultural Society in respect of £350 derived from investments, on the grounds that the Society was not a charitable organisation within the meaning of Section 37, Sub-section 1 (B) of the Income Tax, 1918, Act. On appeal, the Commissioners for the Special Purposes of Income Tax held that the Society was a charity, but this decision was reversed on a second appeal, by Mr. Justice Rowlatt. At the end of last week the Master of the Rolls, Lords Justices Atken and Lawrence, at the Court of Appeal, decided that the Society was a charity within the meaning of the Act,

and therefore was exempt from tax. The Yorkshire Agricultural Society was formed in 1837 for the general promotion of agriculture, by, amongst other means, the holding of an annual show. In 1923 the scope of the Society was enlarged and it was decided to pay attention to legislation and to advise its members on matters affecting the agricultural industry generally. Various arguments were advanced during the appeal, which occupied several days. The chief grounds on which the Solicitor-General (Sir Thomas Inskip, K.C.), on behalf of the Crown, contended that the Society was liable to Income Tax were that, within the meaning of the Act, the Society was not "established" at all, as there was no trust deed or element of permanency as should be the case in a Society established for charitable purposes only, and that the Society gave its members certain privileges, such as the use of dining-rooms at the shows, special rights of admission and railway facilities, free analysis of manures and fertilisers, and admission to auxiliary shows. In giving judgment, the Master of the Rolls pointed out that in the case of the Royal Agricultural Society it had been determined that, although an institution might be a charity, if it carried on a trade, such as a show, for profit, it would be liable to pay Income Tax on that profit. But if such profits were applied solely to the charitable purposes of the Society they should be exempt from tax. He held that the Yorkshire Agricultural Society was established for charitable purposes only, and that the receipts from investments, if applied for charitable purposes only, were exempt from tax. In this the Lords Justices concurred.

Laelio-Cattleya Sunbelle var. Sunset.—Under the illustration on p. 383, we stated that Mr. Hanbury's fine new Orchid received an Award of Merit, whereas it was unanimously voted a First Class Certificate, as stated on p. 372, in our issue of November 12, where the plant was fully described.

Scottish Seed Potatos.—The National Farmers' Union of Scotland reports that trade in Scottish seed Potatos to England is slow, but three varieties in the third-year's test for registration are commanding big prices, especially Arran Banner, the Gold Medal winner at Ormskirk, which is worth £500 per ton, £300 per half-ton, £50 per hundredweight, and £8 per stone. The quantity of Doon Star offered for sale is valued at £50 to £60 per ton, in ton or two-ton lots; £25 per quarter-ton lots, and £6 to £10 per hundredweight. Harold is meeting with a good demand at the following rates, according to dressing:—£30 to £35 per ton, and £2 to £2 10s. per hundredweight.

Bermuda Lilies.—Last year the Bermuda Trade Development Board made an offer on behalf of the Bermuda Department of Agriculture, of one dozen Bermuda Lily bulbs to be awarded as a prize in any competition at annual shows. The Board, under the instruction of the Bermuda Department of Agriculture, is making a similar offer in connection with horticultural exhibitions during 1928. The only stipulation is that societies accepting the prize should give a half-page space free in their schedule for an advertisement of the Bermuda bulbs and that a note should appear in the schedule that the bulbs are given by the Bermuda Department of Agriculture.

Legacy to a Gardener.—The late Commander John Arthur Colwell, of Burleigh, Grosvenor Road, Bournemouth, who died on October 18, bequeathed £500 to his gardener, Mr. Bartlett, if still in his service.

Appointments for the Ensuing Week.—**MONDAY, NOVEMBER 21:** Birmingham Gardeners' Mutual Improvement Association's lecture; East Anglian Institute of Agriculture's lecture. **WEDNESDAY, NOVEMBER 23:** Wimbledon Gardeners' Society's meeting. **THURSDAY NOVEMBER 24:** Paisley Florists' Society's meeting; London Gardens Guild lecture. **FRIDAY, NOVEMBER 25:** Manchester and North of England Orchid Society's meeting. **SATURDAY,**

NOVEMBER 26: Burnley Horticultural Society's show; Harrogate Horticultural Association's show; Lancaster Horticultural Association's lecture.

"Gardeners' Chronicle" Seventy-five Years Ago.—*Cuthill's Plan of Growing Potatos.*—Amongst all the various methods that have been tried for the improvement of Potato growing, none appear so practicable, and at the same time so efficacious and inexpensive as that given to the public by Mr. Cuthill, of Camberwell. Newspapers and journals, both English and foreign, have for years past contained antidotes and systems of cultivation without end; some, doubtless, have answered in certain districts, as is proved by the evidence of the parties adopting such plans; but that they

thinly on a barn floor, or any other cool, dry, airy place on the premises, taking an opportunity now and then of turning the lot over, so that they all come in for a share of air and light, by which means they are not forced by their own heat into making weak shoots, which are broken off when the seed (sets) is taken from the pit. I have no interest in writing on this subject beyond the desire of supporting a system that appears to answer. This year the Potatos almost immediately adjoining my land are scarcely worth raising, and of bad quality; out of 500 sacks, I have but 39 diseased, and 86 small tubers for seed; the rest are fine and mealy, and have been sold at 95s. per ton in Covent Garden. In my own garden I had six varieties of Potatos; our early Kidneys from my own "greened seed" were sound, five other

FIG. 180.—CHRYSANTHEMUM MONUMENT.
N.C.S. First-Class Certificate, November 3. Flowers milk-white. Shown by Messrs. Keith Luxford and Co. (see p. 393).

are not based on sound principles seems evident, because, how frequently do we next season read of some great failure of a crop grown on the same system. It is difficult to call to mind all of even the most feasible propositions that have been published; but having been a close observer of them, from a great anxiety I have always had to obtain the best information on the subject, I can remember none that go so thoroughly into the matter as Mr. Cuthill. The basis of his success is proper treatment and preservation of the seed; and it is due to him to say that since I have adopted his plan of thoroughly ripening the roots required for that purpose, I have had not only a very considerable falling off in the quantity of diseased tubers, but the yield has also been much greater. My plan of "greening" the sets is to allow them to remain on the land for some days after the large Potatos have been picked off. Instead, then, of storing them in pits, I spread them

new varieties bought this season in London were nearly all diseased, fully three-fourths, both in my own garden and also in the garden of a gentleman some miles from here, to whom I gave a portion of each lot. Should anyone doubt the utility of the above plan, I should strongly advise them to try it on a small scale, and wish them the same success that has hitherto attended the adoption of it with me. *E. Compton, Water Newton, Wansford. Gard. Chron., November 20, 1852.*

Publications Received.—*Catalogus Insectorum Jamaicensis*, by C. C. Gowdey; Entomological Bulletin, No. 4, Part 1 and 2; Department of Agriculture, Jamaica; price 2/-.—*The Ley Hunter's Manual*, by Alfred Watkins; Simpkin, Marshall and Co, London, E.C.; price 2/2, post free.—*Roumania and Her Rulers*, by Mrs. Philip Martineau; Stanley Paul and Co., 8, Ensleigh Gardens, W.C.1; price 10/6 net.

The Week's Work.

THE ORCHID HOUSES.

By J. T. BARKER, Dunstable, Bedfordshire.

Species and Hybrids.—The older order of things is gradually passing away in our Orchid houses; fewer plants are being imported, and more and more are being raised from seeds, and as the years pass a greater brilliance of floral colour appears. Occasionally, one is told that Orchids, especially hybrids, have seen their day, and presently everybody will be falling back on the old species again. Fashions in flowers always did exist and always will, but to the lover of the beautiful, as well as of the curious, Orchid flowers will always make a strong appeal.

Zygopetalum.—Flower spikes are developing from the partially-developed pseudo-bulbs of *Zygopetalum Mackayi*, and from now onwards until the flowering season is over extra care must be taken in the application of water to the roots, as an excess of moisture at this stage may cause the spikes to turn black and the leaves to become spotted. Water should only be afforded at this season when the compost is dry, and sufficient should then be given to soak the materials thoroughly, the compost being allowed to become dry before again repeating the operation. *Z. crinitum*, *Z. Clayi*, *Z. Perrenoudii*, and others of this type, should be afforded similar treatment until the growth of the new pseudo-bulbs is fully completed. These plants thrive well in a moist, shady position in a house having an intermediate temperature. The dwarfier-growing kinds, which include *Z. Ballii*, *Z. rostratum* and *Z. Roeblingianum*, should also be afforded a similar position. The *Sphagnum*-moss on the surface material should, if possible, be kept alive by being frequently sprayed.

Repotting.—Plants of the *Bollea* section of *Zygopetalum*, together with *Chondrorhyncha Chestertonii* and *C. fimbriata*, with other plants of a similar nature that are sending out new roots, may be repotted at this season. Pots or pans are suitable receptacles and a rooting-medium of *Osmunda*-fibre and *Sphagnum*-moss cut into short portions, thoroughly pulled to pieces, and mixed well together, is suitable. *Zygopetalum Gautieri* and *Z. maxillare*, being of a rambling nature, are not suitable for growing in pots or pans, and should be fixed to a portion of the stem of a Tree-Fern or other open material. The roots of these two species should be kept moist at all seasons.

THE KITCHEN GARDEN.

By R. H. CROCKFORD, Gardener to THE RT. HON. LORD WAVERTREE, Horsley Hall, Gresford, N. Wales.

Peas.—Make a sowing in a sunny frame, where gentle warmth may be given when necessary, to provide a supply towards the end of next April and early May. Seeds may also be sown in eight-inch pots and the seedlings brought on steadily for the same purpose. The soil should consist of three parts good loam, with leaf-mould, old Mushroom-bed manure and sufficient gritty matter to keep the whole porous. Good varieties of Peas for this purpose are Carter's First Crop, Sutton's Harbinger, and Little Marvel.

Protecting Material.—Owing to the long spell of mild and moist weather, vegetation has developed very soft growth, especially where crops have been planted in loose or very rich soil. It is advisable, therefore, that a good stock of Bracken or other protecting material should be kept dry and ready for use. All decayed leaves should be removed from such crops as Brussels Sprouts and other Brassicas,

Globe Artichokes.—The stems of these vegetables should be cut down and some well-rotted manure dug in between the rows. Should frost become severe, either a mound of ashes or littery manure should be placed around the crowns. Where new plantations have to be made next spring, a good stock of healthy suckers should be potted in six-inch pots, using good fibrous loam, and a little old hot-bed manure, with sufficient gritty substance to keep the whole porous. The pots should then be plunged in ashes, in a cold frame, whence frost can be excluded. Plenty of ventilation should be afforded in open weather. Very little water will be required until the roots have made considerable progress. In the meanwhile the site for the new plantation should be well trenched and heavily manured, leaving the soil very rough on the surface until the planting season arrives next April.

Cucumbers.—Careful ventilation is necessary and should be afforded only when weather conditions are suitable, and then for a short time during the forenoon, after which the lights should be closed down so as to conserve all the solar warmth possible. Spray the foliage lightly on bright days, and keep the atmosphere humid. The cultivator need not be anxious to maintain a high night temperature, as one about 65° will prove satisfactory, and even slightly lower while frost is severe. Mats should be used for protection during the night, when cold winds prevail. Keep the growths trained evenly and thinly, allowing every leaf ample space to develop. Keep a quantity of good fibrous loam mixed with good Oak or Beech leaves, bone-meal and lime-rubble for top-dressing the soil so soon as the Cucumber roots show through. Small top-dressings frequently given will greatly assist the plants. Vaporise the house or pit with a nicotine compound immediately thrips appear. Do not overcrop at this season, or the supply of young fruits will quickly cease.

PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NALL-CAIN, Bocket Hall, Hertfordshire.

Lilium longiflorum.—Bulbs of this Lily should be potted directly they are received from the dealer, and kept in a cool frame until root action is vigorous. The flowering period is determined by the treatment afforded; they may be grown under quite cool conditions, but by a little forethought and arrangement the flowering period may be spread over several months. So soon as the roots are active a batch of bulbs may be gradually inured to heat and brought into flower, while others may be treated likewise at intervals of three weeks or so.

Freeseias.—Plants of the earliest batch of Freeseias are now growing freely and require staking. Unless the flowers are required early, it is not advisable to hasten them by excessive forcing. To have them at their best Freeseias should be grown under cool conditions at all times.

Cyclamens.—These are now producing flowers in quantity and should be kept growing actively by frequently feeding the roots with soot-water and some reliable fertiliser. When applying water it is a mistake to pour the water into the centre of the plant as this causes the flower buds to rot. Remove decaying leaves and spent flowers. The latter should at all times be pulled out and not cut, as the cut end of the flower stalk will decay and prove a source of danger to buds. Cyclamen flowers should always be pulled and not cut, but before placing them in water cut off the hard end and split the flower stem. Young plants raised from seeds sown in August should be large enough to be pricked off into pans or boxes. These latter should be clean and well-drained. A suitable compost consists of loam and leaf-mould in equal parts with the addition of bricks broken into a powder, and silver sand. Pass the whole through a half-inch sieve, rubbing through as much of the fibre of the loam as possible. Prick

out the seedlings about one-and-a-half-inch or two inches apart each way, and grow them on a shelf near the roof-glass in a temperature ranging from 55° to 60°.

HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD, Wrotham Park, Barnet, Middlesex.

Raspberries.—If new Raspberry plantations are to be made and the land has been well prepared, planting should proceed at once. Although Raspberries will succeed on the same site for many years, the time comes when they are not worth the room they occupy. There are different methods of planting. I prefer to set them out in lines six feet apart, the canes being planted one foot apart in the rows. The roots of the Raspberry do not penetrate far, so that the young canes should not be planted too deeply. Heavy, stubborn soils may be greatly improved and made to produce strong, firm canes and heavy crops of large berries annually by trenching, breaking up the subsoil, and adding leaf-mould, old potting soil, decayed material from the rubbish heap, burnt earth, and any other suitable light material, all being thoroughly mixed together as trenching proceeds. Early planting results in a much better and stronger growth than late planting. Dependable varieties include Lloyd George, Superlative, Abundance, Baumforth Seedling, and Norwich Wonder. In these gardens, the old Northumberland Filbasket usually yields heavy crops. When planting young, well-rooted canes, tread the soil moderately firmly about the roots, and let the tops remain to be cut down to the ground level when new growth starts in spring.

Currants.—Push forward the pruning of Currant bushes now that they have shed their leaves. Cut back all the side-shoots along the cordon-shaped branches, also the leaders, provided the bushes have attained a suitable size, but young trees should be allowed to extend their growths until they have reached a suitable height. The pruner should always keep his eye on the most suitable shoots for building up a shapely and profitable head. Overcrowding should be prevented, otherwise much of the fruits will be spoiled when ripe. After pruning the bushes and removing the prunings to the fire heap, dress the land with decayed manure. Fork the land over and string lines of black cotton over and above the bushes as a prevention against sparrows and other destructive birds.

FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P., Ford Manor, Lingfield, Surrey.

Early Peaches.—If ripe Peaches from trained trees are wanted in May, no time should be lost in closing the house, as it is better to start early at a low temperature, with plenty of air, then to force hard against time when the fruits are approaching ripeness. If previous directions have been followed all will be ready for starting the trees. The inside borders should be carefully examined and well-watered with tepid water if the compost is at all dry. For sometime after the house is closed it will not be necessary to apply fire-heat, especially if fermenting material is used, as this will help to create a moist atmosphere that is a great help to the buds. An impression prevails that ventilation throughout the early stages of forcing is of trifling importance, but this is a mistake, as trees that are started while a free circulation of fresh air is allowed, expand stronger and more perfect flowers than others which do not receive this attention. On fine, bright days the top as well as the bottom ventilators may be opened, and when the buds become prominent, gentle fire-heat will favour the admission of more air, while a gentle dewing over with the syringe once or twice in the course of the best part of the day will be of great assistance. A temperature of 40° to 45° is high enough to start with, then, as the buds swell, 45° may

be given as the minimum and 55° as the maximum, with a rise to 60° with sun heat in the middle of the day.

Pot Vines.—If pot vines were thoroughly ripe and in a satisfactory condition for starting, the earliest batch will now be swelling up their buds. If irregular, or the buds at the points are in advance of those near the base, the rods may be bent down over the fermenting material until the faulty part becomes the highest point, when constant moistening will soon assist development. When all the buds are well on the move tie the rods to the wires, but defer the removal of superfluous shoots until those carrying the best bunches are quite perceptible. Later on stop the growths at the first or second leaf beyond the bunch, according to space, tie them down carefully and discontinue direct syringing. Raise the temperature to 60° at night and 70° on fine days. Cover the house at night where this is possible. Pay careful attention to watering, as many pot vines are ruined by an excess of water before the buds have fully expanded, but once these are well on the move and young leaves begin to expand, this danger is considerably lessened. Damp the walls and surface of the bed two or three times a day, according to the outside conditions; keep the evaporating pans filled, but defer the use of stimulants until the berries have set and are swelling. Where free-setting varieties show duplicate bunches, remove the weakest, leaving only one on each shoot, and cross fertilise when they are in flower. Madresfield Court, one of our best Grapes for pot culture, does not set quite so freely as Black Hamburg, but if intermixed with others and all the bunches are dusted with the same brush, fertilisation will be certain.

THE FLOWER GARDEN.

By JOHN COUTTS, Assistant Curator, Royal Botanic Gardens, Kew.

Rock Garden.—At this season, constant attention is necessary to prevent injury to small-growing alpine plants from falling leaves. If any rebuilding is to be done, now is a suitable time for the work, choosing, if possible, a period of dry weather. Even if no reconstruction work is necessary, pockets of soil will need fresh compost. When doing work of this sort it is important to remember that many rock-garden plants have a root system out of all proportion to their top growth, therefore it is necessary to afford them a deep root-run. A depth of three feet is not too much for many kinds. The root-runs should consist largely of rubble and small stones mixed with a little soil; indeed, alpine plants may be depended upon to succeed better in such a root-run than in one composed entirely of good loam. Another advantage of such a compost is the fact that during spells of dry weather the stones help to conserve soil moisture. Many rock-garden plants benefit by an annual top-dressing of fine, gritty compost; this applies generally to plants with a flat, spreading growth, from which they emit new roots into the fresh compost. Subjects liable to suffer from damp should be protected by a sheet of glass.

Lawns.—The levelling and returfing of lawns should be undertaken when weather conditions are suitable. Worn portions of tennis courts, if not already attended to, should be returfed so soon as possible, thus allowing the turf plenty of time to become established. The same remarks apply to cricket pitches and bowling greens. Where greens are inclined to be soft and spongy on the surface, they may be greatly improved by a good dressing of sand applied now. Although sea sand is best for this purpose, any good, clean sand will answer. Free drainage is essential for all playing grounds. Wherever necessary, the edges of paths and drives should be relevelled and straightened as well-kept paths and trim edgings add greatly to the appearance of a garden.

Helleborus niger and its varieties.—Where slugs are troublesome, means should be taken to prevent them injuring the flowers of Christmas

Roses; decaying leaves should be cleared from the plants and a layer of ashes placed around; sprinkling with Tobacco dust also helps to keep the pests at bay. Where Christmas Roses are required for cutting, they must be protected by means of handlights or frames. Plants may also be lifted and placed in frames, but where this is done reserve stocks should be grown, as this Hellebore will not withstand lifting every year.

FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF AILSA, Culzean Castle, Maybole, Ayrshire.

Frames.—Cuttings of various plants inserted in cold frames several weeks ago, are now looking well, and air should be admitted by raising the top ends of the sashes a few inches on all favourable occasions. The soil between the

growth; here they may remain for a few days before being moved to warmer quarters. Bulbs growing in bowls of fibre in a dark room should also be examined from time to time, as they are liable to suffer from lack of water or the visitations of mice; these vermin have an uncanny knack of discovering such bulbs as Tulips and Crocus, and in one night may do irreparable damage. Before introducing bulbs to heat it is advisable to ascertain whether the roots have made corresponding progress to the top-growth, as one of the most important factors in bulb-forcing is to have the plants well established in their pots or boxes before forcing commences.

Herbaceous Borders.—With the exception of a few belated flowers, the herbaceous borders are now shorn of their beauty, and a general clean up is necessary, although the method of cutting everything down to the ground level

FIG. 181.—CHRYSANTHEMUM SOUTHAMPTON.

N.C.S. First-Class Certificate, November 1. Flowers bright yellow. Shown by Mr. H. Woolman. (see p. 393).

rows of cuttings should also be stirred occasionally to keep down moss and weeds. Afford water only when the plants appear likely to suffer for want of it, and that, as a general rule, is very seldom during the winter months. Violets which were planted in frames in September are now providing a few flowers, which should be picked regularly; remove decaying leaves, especially from the crowns of the plants, where they have a tendency to smother the flower buds. As severe frosts may be expected, mats should be kept handy in a dry place for covering the frames, but as nothing is gained by coddling the plants, the mats should be removed immediately the danger is past, and dried before being used again, as a dry mat will prove much more effective in keeping out frost than a wet one.

Bulbs.—Examine the earliest potted bulbs in the plunge bed and remove to a cold frame or cool house any that are showing a fair top-

is not a good one. Many plants that are not considered quite hardy will survive in the open border if protected by their own decaying foliage, and the intermingling browns and greys keep the borders in a more or less furnished condition during the winter. Where borders contain members of the Erica family these help greatly to bridge over the dull period. Varieties of Erica vagans and E. stricta have still some remnants of their autumn displays, and the many forms of E. carnea are already bristling with buds, which in many districts are usually showing colour before the end of the year. Morina longifolia is still showing its pinky-white whorls, and that wonderful Lupin, Sunshine, has never been out of flower since its first glorious display of yellow in June. Kniphofia grandiflora has extended the flowering season of this splendid family, its orange-scarlet torches being most conspicuous when other varieties have faded. A few of the later Asters, notably of the Novi-Belgii type are still presentable.

ALPINE GARDEN.

MESEMBRYANTHEMUM UNCINATUM.

MANY flower-lovers in any but the mildest parts of the British Isles must envy their fellows in the south who can grow *Mesembryanthemums*, and who can enjoy outdoors their brilliant flowers and their distinct foliage. It is a revelation to visit a southern garden where these Noon Flowers are well represented, and many of us must breathe a sigh of regret at our inability to retain these charming flowers except under the shelter of glass. The species which appears to be the hardiest and the only one which affords any prospect of success in gardens with a moderate, as contrasted with a mild, climate, is that named *M. uncinatum*, which, apart from its chances of producing flowers, is a most distinct-looking plant for a rock garden. It is a shrubby species, forming many branchlets, sharp-pointed and almost spiny, and of a grey-green colour. It is, unfortunately, a shy bloomer in the north, but when it produces its pink flowers it is much appreciated, although even if it never flowered it is of value as a plant of distinctness and considerable attraction. It grows about nine inches high. It should always have the hottest, driest and sunniest position possible, in light soil, but even in a climate not too dry in winter it does not appear to suffer. *M. uncinatum* may be increased by cuttings. It should not be confused with another species called *M. uncatum*, which is not so hardy.

ROSMARINUS OFFICINALIS VAR. PROSTRATUS.

THE Rosemary, with its legendary and other lore, has long been a favourite in British gardens, and the introduction of the prostrate form from Corsica, called *R. o. prostratus*, was welcomed with delight by many lovers of rock plants. Its appearance was enough to justify the eagerness with which alpinists desired to possess it. Its small, delightful foliage, its gracefully pendent habit, and its pale blue flowers—which looked so exquisite on their carpet of greenery—were all sufficient as a passport to its introduction to many, many gardens. But—and it is a pity that a “but” should occur in connection with one’s merited words of praise for such a charming plant—it has not proved hardy enough for many northern gardeners, and even for some in more favoured districts, therefore, those who wish to retain it would do well to keep a few cuttings in a frame during winter, to replace plants which may succumb during severe weather. It is just possible, although I have not tried it, that plants protected by a sheet of glass might survive, but a trailing plant such as this is not such a good subject to protect in that way as one on the level. Yet this prostrate Rosemary is so beautiful that some special care should be taken to retain it. *S. Arnold.*

ESCALLONIA RUBRA PYGMAE.

THIS is a very charming little rock garden shrub. It is an evergreen, the habit is dense and compact, and it bears throughout the summer and autumn an unending crop of little Fuchsia-like flowers of a bright crimson. *E. r. pygmae* appears to have been discovered as a “Witch’s Broom” growth on a bush of the species in Ireland. But, notwithstanding this, it does not show much tendency to revert. Occasionally it may put forth a long, vigorous shoot, but such behaviour is easily kept in check. *E. r. pygmae* seems to be quite hardy, as one might have expected, since *E. rubra* is quite one of the hardiest species of its genus. Propagation must, of course, be carried out by means of cuttings, and in this there is no difficulty. Like other *Escallonias*, this dwarf variety enjoys a light, free soil and full sun.

HELIANTHEMUM ALYSSOIDES.

IN many respects this is the best of the Sun Roses with yellow flowers. I make that claim for it because, with me, at any rate, it has a longer flowering period than any other, practically continuing to bloom without cessation the season through. Then it is of a more compact and less straggly habit than its nearer allies. Making a dense cushion, not often more

than a foot in height, but possibly three feet wide, it maintains that neat and orderly shape for years, never needing any cutting back beyond the removal of the spent flower spikes in early spring. The leafage is pale green and downy, and the saucer-shaped flowers, over an inch across, are a particularly pleasing, warm, golden-yellow. Though a native of Spain and Portugal, *H. alyssoides* is quite hardy in any poor, stony soil, and it is, as I have suggested, a plant that will carry-on for many years without showing any signs of deterioration. *A. T. J.*

BULB GARDEN.

NARCISSUS CANALICULATUS.

THIS miniature *Tazetta* *Narcissus* from Mentone is delightful when placed in sunny pockets in the rock garden, in well-drained, sandy loam; the narrow, erect, bluish-green foliage is an excellent foil for the scapes, each bearing three or four flowers with a white, reflexing perianth and globular, golden cup. The flowers are fragrant and delightfully pretty, the whole plant being about six or seven inches in height.

Last spring I was impressed by the beauty of a small colony of this little *Narcissus*, growing in a rock garden. Another beautiful little species characterised by wonderfully rich colouring, is *N. juncifolius*, from the Pyrenees; the rich, golden-yellow flowers are little larger than those of the Buttercup, the tiny crown quite flat, and the height of the plant some three or four inches. The leaves are Rush-like and cylindrical and the small, ovoid bulb is not more than half-an-inch thick; the flowers are faintly but pleasantly fragrant.

These miniature *Narcissi* are delightful when grown in pans in the alpine house or cold greenhouse. *Ralph E. Arnold.*

HARDY FLOWER BORDER.

ACHILLEA GOLD PLATE.

I WAS glad to observe Sir Herbert Maxwell’s favourable comment upon *Achillea* Gold (or Golden) Plate, in your issue of October 8, p. 290. It first came under my observation last year, when I saw it in the nursery of the Glasgow Parks Department, at Bellahouston Park. At that time, Mr. William Robertson, now Parks Superintendent at Llandudno, drew my attention to it, and spoke highly of it. I had previously seen cut flowers of *A. Gold Plate* in a large vase and was very pleased with the blooms and the effect they produced. I have grown *A. Gold Plate* in my own garden this year, and, although planted late, after one or two temporary shifts, owing to its place not being ready in my new garden when it arrived, it has been very fine. It is the best of the tall, flat-flowered, yellow *Achilleas*, and, compared with that named Parker’s variety, shows its superiority at a glance. *S.*

ANEMONES.

ON most soils which are moderately well-drained *Anemones* may be raised from seeds. If a sunny, sheltered situation is chosen for the seed-bed and the seeds are sown in March, the resulting plants will begin to bloom in the autumn and continue to flower for some months. By making successional sowings, blooms may be obtained throughout most of the year. The seed bed should be prepared by removing the top spit, adding a four-inch layer of well-decayed cow manure, and returning three inches of the top soil, finely sifted. Heavy soils will require the addition of sand. The surface of the bed should be firm and even. As the seeds are woolly it is a good plan to rub them with sand, and sow thinly in drills drawn six inches apart. Lightly cover the seeds with very fine, sandy soil. Germination is very slow. The beds must be watered during the absence of rain and mats or other coverings may be placed over them to keep the surface moist. Remove all weeds and thin the seedlings to six inches apart; thinnings may be transplanted if carefully handled.

There are numerous strains of these beautiful flowers, but *Anemone coronaria* (Poppy Anemone), *A. St. Brigid* and *A. fulgens* have proved satisfactory.

Roots of these *Anemones* may be planted from October to April. In very cold or damp districts planting should be deferred until January and the beds covered with long litter, Heather or Bracken, until danger from severe frost is past. Plant the roots from four to six inches apart and three inches deep, choosing a dry day when the soil is in a good working condition.

The Poppy *Anemones* should be lifted each year after the foliage has died down; their flowers are greatly prized for cutting, and by planting at intervals from October to December a succession of blooms is obtained during the early spring, when they are most useful. The *St. Bavo* *Anemone* has been raised from the favourite *A. fulgens*; when planted in the autumn flowers are produced during March and April; the colours are scarlet, rose, salmon, blush and carmine; many have a white centre. They are free-flowering *Anemones* of graceful habit, and their height is about nine inches.

A beautiful variety for a sheltered situation is the dainty double *Rose de Nice*, of delicate pale rose colour. The *Peacock* *Anemone* should be planted in a warm, sheltered situation.

Anemone fulgens is very hardy, but it likes a well-drained, rich soil, and a sunny aspect. When planted early in the autumn it will flower during the winter. It is very suitable for the wild garden, woods and banks. There is a large-flowered variety with extra petals and brilliant scarlet flowers on long stems; this lasts well when cut. *C. Ruse.*

PULMONARIAS.

SAVE for the fact that they appear at a season when flowers are few, the majority of the *Pulmonarias* are not particularly attractive. But there are two good sorts, and both have unspotted leaves. These are *P. azurea* Munstead variety, and *P. rubra*, presumably a species. The former, though it has not altogether lost the puce tint as the flowers fade, is a richer, purer blue than any other known to me, and the blooms are considerably larger than those of *Lungworts* in general. *P. rubra* is a robust and vigorous grower whose pale green leaves during summer are as large as those of a Dock. But before these have commenced to grow, the flowers have the field to themselves, and they are produced on stout, branching stems up to a foot in height. In colour, they are quite unlike those of other *Pulmonarias*, being a bright cinnamon-red of an unusual and pleasing shade. There is not the remotest trace of blue in these from start to finish. Both of these are admirable plants for the woodland, mixed border or shrubbery, and they are indifferent as to soil or situation. *J.*

WOODLAND GARDEN.

SCHIZOCODON SOLDANELLOIDES.

THERE are few choicer woodland plants than this, and it is refined and beautiful enough to associate with the rarest of *Shortias*, *Chimaphilas* and other treasures of the kind. *S. soldanelloides* comes from Japan, and it is not really difficult if one has the right conditions and a decently healthy root to start with. With me it does very well in a light, well-drained but cool soil generously mixed with really old, black leaf-mould from Oak and Pine woods, and containing some buried stones. Thin shade from the hottest sun is desirable, and there should be no lack of moisture in spring and early summer.

In common with the *Shortias*, I believe this plant appreciates a certain amount of acidity in the soil. Given such treatment, *S. soldanelloides* should grow into a low mat of rounded, leathery, dark-green leaves, which are glossy and slightly toothed. In spring the flowering stems rise to about six inches and bear several nodding blossoms, bell-shaped and beautifully fringed, like those of a *Soldanella*, and of a most exquisite rich shell-pink colour. *J.*

TREES AND SHRUBS.

SPIRAEA DISCOLOR.

PERHAPS more commonly known in gardens as *Spiraea ariaefolia*—a name apparently given to it five years later than that of *S. discolor*—this species is amongst the most attractive of the genus. It is a native of Western North America, and was introduced to cultivation in this country by Douglas in 1827. *S. discolor* (Fig. 182) forms a large, bushy shrub ten feet or more in height and considerably more in diameter, and is a handsome subject if grown as a specimen plant where it has a dark background; it is also attractive if placed towards the back of a mixed border of shrubs. It is absolutely hardy, grows vigorously in loamy soil, and is easily raised from hard-wooded cuttings.

Although the growths are erect at first, they become branched and arch gracefully; the ends of the branches, which are downy when young, becoming pendulous and terminated during July with drooping, feathery panicles of small, creamy-white flowers. The leaves are ovate in outline, and from two inches to four inches long, those on the flower stems being rather smaller, with their margins lobed and sharply toothed. They are rich green and hairy on the upper surface, the lower surface being thinly clothed with grey felt.

S. discolor should be included in every collection of shrubs, as it is undoubtedly one of the most beautiful of summer-flowering plants.

BERBERIS YUNNANENSIS.

THIS rather rare Barberry was discovered by Delavay in Western China in 1885, but several years elapsed before it was introduced to this country. It is a deciduous shrub of good habit, forming a dense, bushy plant composed of stout, erect growths up to six feet tall. These growths are deep red in colour when young, changing in the second year to grey, the lower halves being furnished with three-parted, stout, yellow spines, an inch or more in length. The leaves, which are borne in clusters, are obovate, the apex being short-pointed, and the base tapering to a short, slender stalk. They are about an inch in length, have entire margins, (though those on the sterile growths are sometimes dentated), and are rich green in colour, but paler beneath.

The flowers are borne in pendulous clusters on slender stalks one inch or more in length. They are pale yellow, and large in comparison to those of most of the Barberries, being three-quarters-of-an-inch in diameter. These are followed by a profusion of oval fruits about half-an-inch in length, of a bright red colour, the bases (when young) being tinged with a plum-coloured bloom.

Berberis yunnanensis is a valuable shrub for autumn effect in the garden as the foliage becomes tinted to almost the same colour as the fruits, while the rich colouring of the young growths makes it additionally attractive throughout the winter. This *Berberis* is closely related to *B. diaphana*, another native of Western China, and apparently differing in its leaves, which have toothed margins and in having more flowers in the clusters. A. G. F.

CISTUS LAURIFOLIUS.

THIS is one of the most useful of the Rock Roses, since it is the hardiest and, being rather a stiff-habited shrub of sturdier build than most, it is able to withstand strong winds without shaking loose. It is a first-rate subject for dry banks of poor soil. In such conditions it will make a bush of about six feet in height and as much in diameter. The ovate or ovate-lanceolate leaves are dark green, with pale under parts. The margins are wavy, and from both surfaces an aromatic gum is exuded which at certain times gives a delightful fragrance.

Although *C. laurifolius* is not so striking as some other species as a flowering shrub it is distinctly effective when covered with its pure white blooms, two inches to three inches across, which are produced in erect panicles six inches or so in length. The flowers usually appear about mid-summer and continue for several weeks.

C. laurifolius is a native of south-west Europe, and was introduced about two hundred years ago. It is believed to be one of the parents of the well-known hybrid, *C. Cyprius*. It is not a long-lived shrub and is liable to get gaunt and lanky, but it is very easily replaced either by cuttings, which strike readily, or by seeds. In my woodland garden this *Cistus* does its own propagation, self-sown seedlings frequently appearing. In any case, seeds sown in drills in the open germinate quickly, and thus a fresh stock is available with a minimum of trouble. A. T. J.

GENISTA TINCTORIA.

IF our native Dyer's Greenweed is not in itself a plant of much garden merit it has given us certain forms of undoubted value. In these autumn days, for example, there are few more desirable flowering shrubs than *G. tinctoria* var. *elator*. This is an upright-growing variety, attaining a height of four to five feet, and pro-

a loose, tangled, semi-prostrate bush of slender stems which, with the leaves, are more or less hairy. As a rule this variety is always the first of its set to flower, the panicles of brassy-yellow blossoms often appearing in quantity during late June and continuing for two months. Compared with many Brooms of its season, this cannot be considered a subject of outstanding quality, but it is, nevertheless, always distinct and interesting. J. R. W.

EUONYMUS JAPONICUS.

THE typical *Euonymus japonicus* was introduced from Japan many years ago. It is a most useful ornamental evergreen shrub for town gardens, and in many towns on the south, south-west and south-east coast specimens ten feet or more in height are frequent. In some favourable situations it is largely planted as hedges. Variegated varieties are numerous and their bright, glistening foliage renders them very attractive during winter. Specimen plants

FIG. 182.—SPIRAEA DISCOLOR.

ducing long panicles of vivid yellow flowers at the tips of its slender, leafy branches. There is no other shrub that I can call to mind which is so useful as this is for affording a pleasing break of yellow among the later *Ericas* of the Heath garden, for it is in full bloom after *Cytisus nigricans* is over, and it is incomparably better for the purpose suggested than the autumn-flowering *Gorses*.

The quite dwarf, compact and mound-forming *G. t. flore pleno*, with its very deep green foliage and branches, is another departure afforded by this species. It is a plant of first-rate importance to the rock gardener, for it will endure the poorest and hottest of soils, upon which its rich green is always cheerful, and the latter it will smother with deep golden blossoms in the later summer. This little shrub is, moreover, always orderly and neat and presents no difficulty in cultivation. There are other forms of *G. tinctoria*, the most distinctive being var. *mantica*. This is a plant of middle height, usually not above two feet, and it makes

may be grown in large pots or in tubs and are most useful for placing upon the terrace and in various other positions at the approach of winter, when tender subjects have been removed. Shapeliness may be maintained by judicious pruning.

Small plants are suitable for planting in beds for winter effect and for filling window boxes. For this latter purpose they are largely used in towns and often thrive where many other subjects perish.

There are dwarf, compact *Euonymuses* suitable for the rock garden and a delightful trailing form is grown under the name of *Euonymus radicans kewensis*. *E. radicans* may be used as a climbing plant on old walls, and although growth is slow it emits roots from the branches in the same way as Ivy and becomes self-supporting. *Euonymus radicans tricolor* has white, yellow and red variegation; it grows well in light soil, is one of the hardiest variegated forms, and is attractive as an edging to beds, paths or carriage drives. C. Ruse.

NOTES FROM WISLEY.

A MERE collection of plants in a garden, while interesting enough to those who make a study of the particular genus or species in question, frequently fails to give much pleasure to the average garden visitor, even though he be a keen gardener. There are many cases, however, in which a judicious arrangement of the plants or their surroundings may make all the difference and create a garden picture capable of being appreciated by everyone. For instance, the Pinetum at Wisley has never been very popular with visitors, for although it contains an interesting collection of Conifers, which includes several choice specimens, there has been little or no attempt either to plant for effect or to make an attractive walk through it. Fortunately, this error is being remedied, as a broad grass walk, nearly four hundred yards long, is in course of construction, which should create a new interest in this section of the gardens. It leads from the newly-formed Fernery, which incidentally, now begins to look extremely well, and will pass into the large Pine wood near the Director's house. It is hoped to plant this wood with Rhododendrons and to make a feature of the long pond which lies concealed there. The large quantities of peat which occur on the banks will greatly facilitate the establishment of Ericaceous subjects. It is also proposed to build a bridge over the public footpath dividing the Pinetum, to replace the small gates in the fence which are in use at present.

With regard to the Pinetum itself, several trees which have been hidden by Brooms and Brambles—as, for example, a pretty, pendulous variety of *Picea pungens glauca*—will be exposed to view and their health should be stimulated by the clearance of the surrounding undergrowth.

The soil at Wisley is not at all unsuited to the growth of Pines and Cedars, and although it is drier than that to which most Spruces are accustomed, well-grown specimens of *Abies grandis* and *Abies Vietchii* are to be seen. Another Conifer of which there is an exceptionally fine specimen, and one which is, perhaps, the largest in this country, is *Pseudotsuga Douglasii* var. *Fretsii*, the foliage of which has a strong scent of Lemon and Verbena.

In addition to those growing in the open there are some Conifers in pots, and these lend interest to the plants in the alpine house. Naturally, they are chosen from among the dwarf-growing kinds, and their stature is further limited by the way in which they are potted, whereby the amount of soil available is reduced to a minimum. Among the latter may be found examples of the Coffin Juniper, the wood of which is said to be used in the manufacture of coffins for the Chinese nobility; *Juniperus communis hibernica* and *J. hibernica compressa*, of which some quite aged plants are still less than one foot high. A large and shapely specimen, however, growing in the rock garden moraine, has reached a height of two-and-a-half feet, and there are doubtless many much larger specimens in this country. It would be interesting to know the maximum height to which specimens of this variety have grown. Another interesting Juniper in the alpine house is *Juniperus echinaeformis*, which, as its name suggests, makes a hedgehog-like plant, while among the Cypressess, plants in pots include *Cupressus tetragona minima* and *C. Fletcheri* with grey-blue foliage.

Although few plants are in bloom in the alpine house at the present time, one may speculate upon the amount of flowers to be produced next year, and among other subjects which show promise of abundant bloom are those of *Primula Loezii*, a rare plant of which there are many sturdy crowns. There are also many healthy plants of the blue Poppy, *Meconopsis Baileyi*, which have been raised from seeds collected from the group which flowered in the Wisley rock garden this year. Among the few plants actually in bloom mention may be made of *Campanula strigosa*, an annual with rather large flowers, and of *C. fenestrellata*, which has produced flowers almost without a break since June. A late-flowering

Saxifrage is the half-hardy *S. Fortunei*, with red pedicels and red foliage that begins to die down almost so soon as the flowers appear.

Many newly-received *Crocus* species are in flower in the alpine house frames, including *C. ancyrensis*, with large blooms of a very pale lilac; *C. hadriaticus lilacinus*, and *C. hyemalis Foreii*, the small, white perianth of which has violet markings on the reverse and encloses deep violet anthers. These Crocuses, together with other hardy corms and bulbs suitable for growing in a rock garden, will soon be transferred to new quarters, as four new cold frames, each twenty-four feet long, have just been completed, and make a welcome and long-wanted addition to the alpine department.

On the rock garden, *Gentiana sino-ornata* is still making a brilliant display of deep blue. Another blue-flowered subject, *Linum monogynum*, is also flowering. Further bloom is provided by the secondary flowering of Rock Roses and of *Cistus*, such as *C. florentinus* and *C. crispus*.

The duration of the autumnal colour effects has been rather short, particularly in the case of the Pear plantation on the hill, which usually provides a brilliant spectacle lasting for some time. There are many trees and shrubs, however, which are still beautiful on account of their fruits. Among the most conspicuous of these are *Berberis Autumn Beauty*, with its large, coral berries, and a Chinese form of *Cotoneaster rotundifolia*. The leaves of the latter, although apparently evergreen, fall during the winter, but the bright scarlet berries have been known to persist so late as May. Other *Cotoneasters* valuable on account of their berries are *C. lactea*, *C. serotina* and *C. pannosa*, which are all rather similar, having evergreen foliage and an abundance of small, brick-red berries. One of the most ornamental of the trees which are valuable for their fruits as well as their flowers is *Pyrus Eleyii*. In this case the beauty of the fruit is by no means skin deep as the flesh is deep crimson right to the core. J. E. Grant White.

NOTES FROM A WELSH GARDEN.

THAT such a fine old plant as *Schizostylis coccinea*, appreciates an abundance of moisture seems evident, for after a wet summer and drenching autumn, a patch of it is carrying more flowers, and these of larger size than I can remember ever having seen before. While there may be much to be said for the pink-flowered variety, Mrs. Hegarty, this can never give the glow of warm, rich colour which the old plant affords, and which blends so sympathetically with the hues of autumn. It has so happened that the autumnal tints of a young specimen of *Liquidambar styraciflua*, about ten feet high, were at their brightest just when a patch of the Kaffir Lily at its feet was at its best. The two together made a wonderful conflagration of colour.

Autumn colour, on the whole, has been somewhat disappointing this season, owing to the constant wet and high winds. That reliable old stand by, *Azalea pontica*, has done its best, and a very good best it has been, especially where there are a good many bushes, for as these very seldom colour at the same time, one or other will always be on show, and one gets a long rotation. There may be many shrubs which afford more vivid hues, notably *Vaccinium corymbosum*, *Euonymus planipes* and *E. alatus*, but these more often seem to surrender piecemeal. *Azalea pontica*, on the other hand, almost invariably flushes into colour in its entirety, every leaf responding simultaneously to the change. Moreover, each of the various bushes of a group will not only ripen its foliage at different dates, but each will be, so to speak, self-coloured—one all bronze, another all crimson, and a third yellow. That, at any rate, is the rule where a goodly number of these shrubs is growing on the thin soil of an open woodland slope.

Lithospermum rosmarinifolium came into

flower this season early in November, that is before *Gentiana sino-ornata* had ceased, and their respective colours were exactly alike. The former came through the destructive frost of last spring unharmed, and the plants are in an exposed position, but I always grow them in the poorest of stony soil on the brink of a dry retaining wall. One of the largest plants of this singularly beautiful *Lithospermum* has close by it some examples of *Coronilla glauca* breaking into blossom, which means—frost not intervening—that one will be able to enjoy the brilliant sapphire of the one and the clear yellow of the other in contiguity. But of the two I have always found the *Coronilla* the more tender.

Though its near allies, *Geranium argenteum* and *G. cinereum*, are now dejected, messy heaps of sodden foliage, *G. Farreri* seems to be but little affected by the weather. In fact, this excellent little plant, surely the most attractive of all its closer kindred, has flowered on and off all the summer, and it is even now carrying several fresh blossoms. There is a singular daintiness and refinement about this *Geranium* while in size of blossom I know no dwarf sort to compare with it.

Two years ago, I came across an *Oxalis* in a village on the west coast. It was naturalised in cottage gardens and roadsides. This has been identified as *O. incarnata*, a native of the Cape, whence it came some two hundred years ago. I believe this species is not uncommon as a cold greenhouse and window plant, but it has proved most amenable to out-door culture here, flourishing in the woodland and other parts of the garden with the best of good will. Moreover, it has flowered almost without cessation since spring, and there are still many blossoms open and to come. These beautiful blooms are much the shape of those of *O. Acetosella*, but about twice as large, and their colour is a beautiful shade of pale bluish-lilac without any veining, just the colour of *Cardamine pratensis*. In foliage and habit, *O. incarnata* also has no little resemblance to our common Wood Sorrel, but it is much more susceptible to changes of temperature than the latter. This is very noticeable when the two species have got mixed together in the woodland, for the exotic will fold its leaves immediately to changes which do not affect the native.

The charm of that subtle blending of blue and yellow referred to is emphasised in the rock garden by *Felicia rotundifolia* which, in spite of the wretched weather, has never been without a sheaf of its elegant blossoms since early summer and it is still bright with colour. These Daisy-flowers, about an inch across, have a rich, golden-yellow disc and rays of an exquisite china blue. They have a resemblance, therefore, to the old *Agathaea coelestis*, but they are neater and more symmetrical than those of that rather unfinished-looking plant. *Hypericum olympicum*, with a good late crop of flowers, having been invaded by the lavender-blue blossoms of *Convolvulus mauritanicus* gives yet another of these blue and yellow harmonies which are so arresting.

Two yellow-flowered, dwarf shrubs which can always be relied upon to afford some cheerful colour at this season are the excellent old *Hypericum Moserianum* and *Potentilla fruticosa argentea nana*, or *P. Beesiana* as I believe it is sometimes called. *Mimulus (Diplacus) glutinosus* is also a first-rate autumn bloomer here and its golden-buff flowers strike a distinctly seasonable note.

If an absence of sunshine has had a depressing effect upon some late-flowering shrubs, notably *Olearia semidentata* and a few of its allies, others which one might assume are no less fond of the sun have responded to the high temperature and abundant moisture by producing quite a good second crop of bloom. *Fremontia californica*, *Dendromecon rigidum*, *Desfontainea spinosa* and *Leptospermum* are among these. The *Desfontainea*, indeed, has done exceptionally well owing to the wet, the bushes flaring into successional crops of blossom throughout the season. By way of experiment I recently put a specimen of this fine Chilean shrub close to the bog, where there is a good deal of clay in the subsoil and not the best of drainage, and so far it has gone ahead with the best of promise.

Genista fragrans, on a dry, sheltered bank, can usually be counted upon to give some colour at this season, but it is now much better than usual. The fact that it has had practically the whole of its spring crop of bloom destroyed by frost may in part account for this. Close by it is an equally fragrant bush, *Daphne Dauphinii*, which, coming into flower in November, will maintain a succession of its rich purple blossoms during mild weather until spring. The very sweetly-scented *D. Mezereum* var. *autumnalis* ought now to be rivalling the foregoing both in colour and perfume, but the *Mezereums* do not prosper here. For some reason yet unsolved they simply endure with a bad grace and then expire. Yet in neighbouring cottage gardens they do famously.

Among *Ericaceous* shrubs, *Erica Watsonii* (*E. ciliaris* × *E. Tetralix*) has made a bright show of colour, carrying on later than either *E. ciliaris* or the excellent *E. Maweana*. But the persistent rains have practically spoiled most of the autumn-blooming *Heaths*, even *E. stricta* fading much earlier than usual. On the other hand that beautiful shrub *Daboecia polifolia alba*, of which the form with the large, almost globular, flowers is the best, has done splendidly, and is even now almost as full of bloom as ever. It has flowered unceasingly since May and will continue until the first hard frost. *Phyllodoce coerulea*, a rare native of northern Britain, has also enjoyed the moist conditions and yielded a few of the bluish-purple blossoms which one so seldom sees.

Hybrid *Pernettyas* are carrying a wonderful crop of berries and one's only regret is that these highly attractive and useful little shrubs should have such a passion for suckering. This necessitates discretion in planting, but the fruits are so handsome and remain so long—usually until the little white flowers appear in spring—that a place must always be found for a good group. Though *Ericaceous*, it is said that *Pernettyas* will do well in calcareous soil, which is yet another recommendation. A. T. Johnson, Ro Wen, Conway, North Wales.

GARDEN NOTES FROM SOUTH-WEST SCOTLAND.

THAT incomparable autumn flower, *Gentiana sino-ornata*—incomparable for its colour and the profusion in which it displays it, for its vigour and easy propagation—has but one weakness, its splendid blue cannot withstand the drenching rain which has been so frequent of late. It washes the colour out of expanded flowers; but, happily, even on November 5, there are many buds still to open.

In such an open season as this *Fatsia japonica* (still known in some gardens by the discarded name of *Aralia*) is indeed a noble evergreen. This time last year its display was marred by an early sharp frost; but now the bushes are plentifully set with erect panicles of round flower heads resembling carved ivory, well set off by the broad glossy leaves.

Bulbs of *Lilium auratum*, brought here direct from Yokohama, always flower later than established plants, and have had their blossoms sadly tarnished by October rains. Not so the flowers of *L. philippinense formosanum*, some of which delay opening till late autumn, and pass without stain through very dirty weather. In form and purity this is one of the loveliest Lilies.

Now that half the woodland is bare of leaves, one appreciates the value of *Zelkova crenata*, one of the largest deciduous trees of Japan, which delays assuming its fine, golden, autumnal robe till October is past. *Z. acuminata*, also from Japan, is even later in the seasonal change. On our western seaboard, *Chionanthus virginica* does little towards fulfilling the promise of its generic name—meaning 'Snowy Flower'—for it requires hotter sunshine than it gets here to sheet itself with blossom as it does in the south-eastern United States. Here, indeed, it does flower in July, but far too sparsely to suggest anything like snow; but its ample foliage turns bright yellow in November, after most other trees stand stripped.

From the same south-eastern States comes a shrub far better worth growing—to wit, *Clethra acuminata*, which never fails to produce plenty of racemes of fragrant, white flowers in August, and thereafter to stand robed in fine rich gold.

Those who grow Daisy Bushes—i.e., *Olearia* species—when they see the clouds of seeds scattered by the winds of autumn, may have speculated, as I used to do, to what purpose was this waste of living matter. Our own too familiar *Groundsel*, nearly related to *Olearia*, takes possession, if allowed, of every scrap of available soil; but it is very seldom that one may find a self-sown seedling of *Olearia*. The reason for that is two-fold—first, there is very little uncultivated ground in this country so thinly occupied by native vegetation as to admit alien colonists; second, rabbits are almost everywhere and greedily devour such seedlings as may root themselves. It was interesting, therefore, to find a wide space left bare by the removal of a large *Rhododendron ponticum* densely peopled in the following year by hundreds of seedlings from a bush of *Olearia macrodonta* near at hand. Herbert Maxwell, Monreith.

differing in certain details. This plant is now being brought into cultivation and for it Dr. Cockayne proposes the name *R. Mackayi*.

In the summer of 1927, under the guidance of the discoverer, I had the pleasure, in the company of Mrs. and Dr. G. E. Du Rietz, of Upsala, and of Dr. Cockayne, of seeing this plant in its habitat. The plant bore a few flowering panicles at the time, and later, Dr. Mackay forwarded to Dr. Cockayne ripe achenes for sowing. The seedlings should throw further light on the origin of the parent form.

That both *R. Barkeri* and *R. Mackayi* are hybrids of which *R. parvus* is one parent appears certain. As to the other parent, there remains some doubt, as *R. schmidelioides* is also present.

I have endeavoured to throw further light on the problem by artificial crossing. A female plant of *R. parvus*, collected in north-west Nelson, was grown at Feilding, and pollinated from a wild plant of *Rubus schmidelioides* var. *coloratus*, of that locality. Six hybrid plants were raised, and these I described in the seedling stage (*Trans. N. Z. Inst.*, Vol. 58, 1927, p. 51). Four of these plants have grown luxuriantly,

FIG. 183.—A HYBRID RUBUS.

Left, *R. schmidelioides*; centre, the new hybrid; right, *Rubus parvus*.

PLANTS NEW OR NOTEWORTHY.

A RUBUS HYBRID OF HORTICULTURAL VALUE (*R. BARKERI*).

In 1898, the late Mr. S. D. Barker discovered near Lake Brunner, Westland, a single wild *Rubus* plant of a form not previously observed. From a portion of this, Dr. L. Cockayne, F.R.S., was able to propagate and distribute a number of cuttings. He described the new form as *R. Barkeri*, and under this name it has since become well-known and highly valued in cultivation. Only on one occasion has it been known to flower. In his book, *The Cultivation of New Zealand Plants*, Dr. Cockayne thus refers to it (p. 22): "*Rubus Barkeri*, with its leaves differing in hue at every season, but always beautiful, is ideal for draping a low wall supporting a steep bank (see Fig. 1) as well as for the bank itself." The figure is a photograph showing the splendid use made of the plant in the Queens-town Public Gardens. Further details are given as to its value and propagation on p. 58, where it is remarked, "Probably a hybrid between *R. australis* var. *glaber* and *R. parvus*."

Later, Dr. Mackay of Greymouth, discovered a second wild plant of similar character, but

and are now (August, 1927) being layered to secure a supply of plants for distribution. These six plants are all extremely alike, and since they offer distinct horticultural possibilities are here further described. They have the general habit and beautiful colouring of *R. Barkeri*, but differ in the shape of the foliage. The leaves are trifoliate (Fig. 183), the leaflets very similar in shape to the leaves of *R. parvus*, but narrower than those of either *R. Mackayi* or *R. Barkeri*. Alternately and somewhat distantly placed along the trailing stems, they form sprays of great beauty. The dark bronzed colour of the upper surfaces in autumn and winter, relieved by the distinct, delicate venation and the regular serrate-dentate toothings, contrast finely with the golden yellow of the stems and prickly leaf-stalks. As the plants are hardy and of easy propagation, they should prove a welcome addition to the list of foliage plants and provide a means of clothing banks and walls otherwise difficult to adorn. Scientifically, they are of importance as giving strong support to the theory of the hybrid origin of *R. Barkeri* and *R. Mackayi*, a support all the more welcome as the wealth of wild hybrids in the New Zealand flora is not yet appreciated at its proper value. H. H. Allan, Feilding, New Zealand.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the **PUBLISHER, 5, Tavistock Street, Covent Garden, W.C. 2.**

Illustrations.—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Editors and Publisher.—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers.

Urgent Communications.—If sent by telegraph, these should be addressed "Gard. Chron.," Rand; or by telephone, to Gerrard, 1543.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Letters for Publication as well as specimens of plants for naming, should be addressed to the **EDITORS, 5, Tavistock Street, Covent Garden, London.** Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

MR. F. KINGDON WARD'S NINTH EXPEDITION IN ASIA.*

XIX.—A REST CURE.

IN the jungle, trouble is apt to come like a thief in the night. I awoke on the morning of August 13 in an ominous stillness. The chokara came in and lit the fire as usual, but then nothing happened for a long time; I was only half awake, having slept badly, but at last I came to my senses sufficiently to realise that all was not right, and it was the work of a minute to jump out of bed and yell for my Kachin boy to clear the table, which was exactly as I had left it the night before. The chokara answered my summons.

"Where's Laphai Nounng?"

"He went away in the night, Duwa."

"Oh! Call Maung Ba!"

"He went too, Duwa; they both left in the night."

This was a bore, because unexpected. I ordered breakfast, and thought things over. The fugitives had taken a good share of the remaining food, and some of my waterproof sheets, and without my cook, bad as he was, I could scarcely look forward to a week of unalloyed bliss. I had one small savage left, the coolies had dispersed, neither mail nor rations had come, we had abandoned the safe haven of my base camp, and were normally fifteen marches from Fort Hertz and help.

On the other hand, if the expected supply did not come, sooner or later, my servants would have gone off, anyhow, if only to get food. On the whole, the position was not much worse than if they had stayed, and I decided that the only safe plan now was to return to Fort Hertz, by forced marches, get rations, enrol new men, and hasten back to camp. My botanical collecting would suffer, of course; on the other hand, I could collect in the jungle, in a country which had never before been explored botanically. If I could reach my base camp by September 25, I should be in plenty of time for the harvest.

Two starving Nungs, searching for roots and berries, passed, and I sent them to beat up coolies. Tents, camp furniture, and every-

thing else that could be spared was jettisoned; and with my bedding, food, a change of clothes, and botanical press, we started for Fort Hertz at midday on August 15, seven coolies carrying light loads. Owing to the late start, we only covered a single stage by nightfall. Next day, however, we pushed along to some purpose and having reached Gawai, the normal stage, halted only for a meal. It was not possible to do another stage—a long one, that afternoon, but we marched till dark, and turning aside from the path, reached a Nung hut buried in the jungle, and slept there. On the third day we reached Hpalangdam, and after a meal, covered another stage by nightfall; and on the fourth day we did two whole stages, to the Nam Tamai bridge, where we halted, exhausted, having done six stages in three-and-a-half

blooms of a *Diplomeris*, which has a flat flower rather like a *Miltonia*. By the path-side were species of *Commelina* in flower, social clumps of *Impatiens*, *Begonia*, *Polygonum*, and so on. Epiphytic plants included three species of *Lysionotus*, *Aeschynanthus grandiflora* and others, *Melastomaceae*, etc. On the banks one noticed a few *Gesneraceae*, mostly species of *Chirita*. Amongst the forest trees were many species of *Ficus* (*F. cunia*, etc.), *Juglans*, *Engelhardtia*, a *Myrtus* with white flowers, and up on the higher ridges, *Pinus excelsa*, which is not seen to the west, in the basin of the Mali river. Near Gawai, where the soil is sandy, *Gleichenia linariis* is common.

At Panglamdim there were no coolies, and consequently we were not able to start until the afternoon; as a result, we only did one stage

FIG. 184.—THE NAM TAMAI.
A fruiting tree of *Engelhardtia* in the foreground.

days' marching. The days were fine and sunny once the sun had lapped up the thick morning mist, but the heat was stifling, and the biting flies a persecution. Rain fell mostly at night, in heavy thunderstorms; we had undoubtedly struck that mixed blessing, a break in the monsoon.

On these long marches, I amused myself collecting plants, and added many specimens to my Indo-Malayan bag. In the wet thickets were large, coarse *Zingiberaceae*, mostly with white flowers, though some species of *Hedychium* were gaudy with red, orange or cream colours; they looked like clusters of insects, the antennae projecting. Some are epiphytic, generally growing out horizontally, or lolling down, though the flower spike always turns stiffly erect.

There were a few ground Orchids in bloom, especially species of *Odontochilus*, some with white, others with yellow flowers, and I found a shady rock covered with the large, milk-white

on the 19th. We were now marching south-westwards, counter to the ranges, with long ascents and descents. It was four stages to the Tisang river, and despite our efforts it took us three days. Just before we reached Nogmung on the Tisang, I met a man from Fort Hertz, bringing up my mail—but no food. However, it was pleasant to get some news. At Nogmung I was taken violently ill, and next morning would have given almost anything to have been told that there were no coolies available. Unfortunately, they paraded in force; and as the stage was only nine miles, I decided to crawl on. No power on earth could have made me do a double stage that day. As it was, the overflowing Tisang had turned the valley into a lake and we waded knee deep for miles, poor me being horribly and disgustingly sick at intervals, and hoping to die quickly, since it could not be painlessly. Arrived at the hut after nine hours of misery I doped myself with morphia (I know my reaction to

* The previous articles on Mr. Kingdon Ward's Ninth Expedition in Asia were published in our issues of August 14, 28, October 9 and November 20, 1926, and January 1, February 19, March 5, 19, April 9, 30, June 4, 18, July 30, August 20, September 10, October 1, 15, and November 5, 1927.

this dangerous friend to a hair), crept softly between the blankets, and slept for ten hours. Next morning I was shaky but otherwise fit, and we did a hard stage over the highest mountain, followed by a double march on the 24th, which brought us to the banks of the Mali, on the edge of the Hkamti plain.

In the six days' marching from the Nam Tamai to the Mali, I met with several interesting plants. On the topmost ridge, a big scarlet-flowered 'Irroratum' *Rhododendron* was still in bloom, making a fine show. Five years previously, when marching from China to Hkamti Long, I had passed this way in November, and, noticing this very plant, had collected seeds of it (K.W. 5,533). Here it was in flower (K.W. 7,327), but, of course, there are no seeds under the latter number. It is a forest tree, twenty feet to thirty feet high, but it grows only on the wind-swept ridge, where there are just a few specimens; and like all these Burmese 'Irroratums', it flowers very late; it could hardly have opened before August! The flowers are a rich, glossy scarlet, evenly marked all over with small, crimson question marks, and fleshy, pinched up at the base into five pocket glands. The trusses are fat, containing about fifteen flowers each, the leaves fairly large, and dark green.

All the Burmese 'Irroratums' have red flowers, but though a number have received names, such as *R. Kyawi*, *R. facetum*, *R. ombrocharis*, it is doubtful whether they are all sufficiently distinct to warrant being kept up. They are magnificent plants, but not quite hardy. As a rule, they occur scattered through the temperate rain forest, and when in full bloom are a gorgeous spectacle, being easily seen, occurring as they do beneath the main canopy of foliage; also they spread a carpet of glowing corollas on the ground at their feet.

Near the same place, I collected a *Crawfordia*, and a beautiful little white-flowered *Begonia*, with thin, almost membranous leaves, drawn out into a very long drip tip. This species grows only on trees, at about 6,000 to 7,000 feet altitude, with the tips of the leaves hanging downward. Another remarkable species grows amongst boulders in the beds of torrents—or, rather, in the bed of a torrent, for I saw it nowhere else—and has quite regular, almost linear leaves; but this was not in flower. A third species, found growing on rocks, has large, leathery, elephant-ear leaves pressed closely against the surface, and white flowers.

A species of *Garcinia* was not uncommon in the hill jungle, and furnished us with fruit, refreshing and of a sub-acid flavour, which the Nungs climbed for, throwing down great bunches. These fruits, which are bright yellow, and the size of a small Plum, sprout all along the branches, and sometimes even from the main trunk.

On the last day, after a tiresome and slow boat journey against the powerful current, under a bright sun, I waded three miles across the flooded fields to Putao village, and so up the ridge to the Fort, where the Superintendent and the Commandant met me. It was August 25, and I was four days up on my schedule, thanks to those forced marches; to cover fifteen stages of hill jungle in ten-and-a-half days at the worst season of the year was not bad.

What a relief to go into a large, airy, water-proof bungalow! To lounge in a long chair, nay, to sleep on a bedstead—I had left my camp bed behind, of course, and had been sleeping on the ground—was bliss. I had meals with the Superintendent, which relieved my servant of one of his duties; and beyond attending to my plants, I did nothing for the next three days, except lie in a long chair and read.

Meanwhile, I acquired two more servants, but being sick of the sophisticated kind, got hold of raw Nungs, or in other words, coolies, one intelligent, accustomed to seeing an occasional white man in the distance, the other stupid, and about as familiar with white men as he was with white elephants. I also bought five bags of Rice, and other necessities of life for myself and staff. It was hot and clammy on the plain, a thousand feet above sea-level, at the end of August, and we had plenty of rain; now and then the high mountains at the northern end of the plain showed up, but generally the clouds clung to them.

There was not much in flower, or I was too slack to go and look for it. An everyday sort of Honeysuckle was common, also a few *Acanthaceae* (*Strobilanthes*) and other stuff. I found the *Melastomaceae* tiresome plants to preserve; the leaves seem to sweat and become disarticulated, and the whole specimen breaks down into its component parts. *Aeschynanthus* is nearly as bad. I spent a restful week at Fort Hertz, reading the papers, and talking once more with white men; I do not know what it is like not to talk with a fellow creature for months, but I can testify to the dry rot which

CHATSWORTH, PAST AND PRESENT.

THOSE who would compare the past with the present might well begin examining one of those fine old engravings by Jan Kip, which have so great an interest for garden-lovers who realise how much the present owes to the past. The engraving, one of many which were published in that rare French book of 1714-16: *Le Nouveau Théâtre de la Grande Bretagne*, in which Kip, Knyff and other gifted artists collaborated, and which is now available in

FIG. 185.—THE WESTERN IRRAWADDY, OR MALI, RIVER
AT LOW WATER.
Sub-tropical rain forest.

sets in as a result of not seeing a white man to talk to for months!

However, I wanted to be back by September 25, and the prospects of double marching on the return journey were not bright. That meant seventeen marches to my base camp, with the chance of being held up a day or two for lack of coolies; so I determined to start on September 2. It was a horribly wet day, but as I was able to float down the stream in a dug-out, the first stage, that did not matter. I looked forward to the weary marches over the ranges and up to the Nam Tamai with little enthusiasm; but brightened up when I reflected that in another two months, I could start for Assam. The worst of the season was already over. *F. Kingdon Ward.*

English Houses and Gardens (published by B. T. Batsford), shows the Chatsworth of other days. But there have been many changes. One must assume that Knyff saw a wide canal, with bridge connecting the western terrace, between Chatsworth House and the Derwent, since it appears in the drawing from which Kip made his engraving; but it no longer exists, nor is it known what purpose it could have served. Gone the range of low buildings to the north-west of the house, gone the *parterre de broderie* to the south of them. The garden on the south front lives, but with less elaborate adornment. Gone the vast series of intricate bedding on the east front; indeed, one wonders how the gardeners of those days got all these breadths in, since the original mansion could

never have been very far from the steep rampart of hill which Paxton made such wonderful use of in later times. Given a true perspective, there might be many acres of ornate flower gardens between. But was the perspective true?

Let us admit that there were great gardeners about in the early days of Chatsworth. Whether or no the famous Le Nôtre played any direct part there—and probably he did not—he had able disciples. One has read of Grelly, a Frenchman, who was particularly clever in water devices. Among the records in the Chatsworth library is a large volume, beautifully kept in a scholarly hand, showing payments made to various artists and workers late in the seventeenth century, and one of them named Grillet was, perhaps, the "Grelly" of some writers.

Grillet (or Grelly) may have anticipated Paxton in the first garden of the west front, now called the Italian Garden, also with the *parterre de broderie* on the southern portion already referred to. The Italian Garden exists to-day, and very beautiful it is, although there is no trace of the elaborate bedding shown by Knyff and Kip. Instead, there are wide walks and broad areas of grass, broken by vases and clipped Yews, with stone-framed mounds carrying golden Yews amid which are drifts of *Berberis stenophylla*. There are Roses on the terrace walls, and here and there belts of tawny Snapdragons, but of bedding, so-called, there is none whatever. Nor, standing at the front of the terrace, and looking down to where there may once have been a large canal, but where indubitably there is to-day the river with its picturesque bridge on the right, can one feel that it would be in tune with the surroundings. But there is at the middle of the terrace garden a round pool with what is known as the Duke's Fountain, and that is far more in keeping than the gayest of flower-beds. Among trees of particular interest is the Spanish Chestnut planted by the Tsar Nicholas I, in 1816.

No more garish than the Italian Garden is the garden on the south front. The same note of cool, spacious lawns, wide walks, and ample water is struck. Flowers there are, admittedly, but not in the form of wide borders and large beds. When one states that the brightest floral objects are the hedges of Monthly Roses one has, perhaps, paid the best tribute that could be paid to the standard of taste which governs the planting. Far to the south of the grounds lies the Canal Pond, containing the famous Emperor Fountain.

Where, however, are the flower beds of Chatsworth? There are few anywhere. Perhaps the nearest approach to bedding is in the French Garden, which is close to the buildings on the east side. It fronts what was once the Orangery, but which is now a Camellia house. Here there is really bedding, albeit of no gaudy kind—simply a group of beds of bright, old-fashioned flowers, flanked by rows of tall pillars bearing statuary that was once within the building. A charming place, this French Garden. One lingers by it. And while one gazes, one's thoughts go back to the past, and one wonders what effect it would have had on that greatest of French gardeners, Le Nôtre. Would it have satisfied his grandiose mind, with its stupendous visions? Yes, one wonders. On the whole, one is disposed to believe that its appeal would have been greater to a gardener not less eminent than Le Nôtre—our English horticultural giant, Joseph Paxton.

The hand of Paxton is not apparent everywhere at Chatsworth, although it might almost be said that he belonged to the place, since he went there as a young man and stayed all his life. One may believe that when he found there the gardens and the fountains of Grillet (or Grelly) he was content to leave them, while dispensing with most of the *parterres*. One can conceive that he widened the lawns and walks, in order to impart that air of dignity which is now so obvious and so satisfying. It is well-known that one of his greatest achievements was the building of the vast conservatory, so often described. *Sic transit gloria mundi!* The conservatory has followed the canal and the *parterres* into

the limbo of past things. A vestige remains, no more. The Great War brought about its destruction. To the present writer, who first saw Chatsworth in the days of his youth, and not again for more than thirty years, the conservatory is a memory, though not a poignant one. And perhaps if Paxton himself could emerge from the shades, to revisit the scenes that must once have been so dear to him, he would not repine. For after all the conservatory was not his greatest work; nor was that still vaster building which later grew out of it, and now stands on the slopes of Sydenham, his crowning triumph.

No, when the Crystal Palace itself passes, as pass it may, there will still remain, ever becoming more and more beautiful under skilful and reverent hands, imperishable in their setting of stone, the gardens which he made on the hillside to the east. Gardens they are, despite the absence of shaven lawn and trim walk. There must be several miles of paths winding in and out over the declivities, every yard skirted by cunningly placed rocks and shrubs. The stone-shifting must have been the work of years. There was, and is, rock—natural rock—in abundance on the high ground above which are the great meres, and many of the emplacements there are doubtless the work of Nature; but countless tons of stone were brought down to the lower slopes and there used to form an immense variety of erections and homes for plants innumerable.

The treatment of this hillside, carried out by Paxton under the sixth Duke, is in its way an achievement quite as remarkable as Le Nôtre's at Clagny, Versailles, and other places in France; the main difference being that the former are surpassingly clever imitations of Nature, while the latter is frankly artificial. One has to get close to some of the larger masses of rock to see that they are not homogenous, but cunningly arranged conglomerations of stone. And just as the abundant supplies of water from the higher elevations were used by Grillet (or Grelly) for the great cascade and fountains around the house, so they were utilised by Paxton for his gullies and ravines. The great cascade is avowedly artificial and nothing but artificial. It has pleased many eminent persons and displeased many more. But Paxton's smaller cascades on the slopes of the hill, amid masses of *Rhododendron ponticum* and much other semi-wild growth, are so close to Nature as to have all her own charm.

It is there that the chief gardening work at Chatsworth is now going on. The Italian Garden remains, and will remain, the Italian Garden. The French Garden needs, and will receive, little renovation. The lawns, the great walks, the ponds, the pools, the fountains, will not be tampered with. The Chatsworth of to-day will remain, to become the Chatsworth of posterity. But up there, beyond the confines of the formal garden, where Paxton's great work was becoming more and more overgrown with every passing year, where much that he had accomplished was actually hidden by ever-encroaching masses of vegetation—there active renovation is being pursued. Choked ravines are being opened out, new vistas are being cut, fresh plantings are being made. On banks that but recently were tangled masses of nameless growth there are now colonies of *Azaleas*, *Hydrangeas*, *Astilbes*, *Montbretias*, *Campanulas*, *Kniphofias*, *Pentstemons*, *Fuchsias* and other good things. Coloured Maples clothe the sides of dells. Brakes of Broom; a mass of *Clianthus puniceus* magnificent clothing a gigantic stone; *Ceratostigma Willmottiae* with its leaves already assuming the crimson tint of autumn; a clump of *Berberis Vilmoriniana*, with its ruddy stems stiffly upright and prominent; *Senecios* here, *Olearias* there; *Meconopsis Wallichii* and *M. Baileyi* in cool spots near water and shaded by rock; *Pittosporum Silver Queen* against grey crag; ample groups of *Liliums*—these are but a few of the things one sees in or out of flower—green, red or grey.

Plants old, and plants new, are being used in this great work of renovation. One looks up Fir-clad slopes to see towering pillars of Fern, then down to drifts of lowly Iris under

walls. There is not the remotest fear, in what is being done, of any violation, however slight, of the spirit of the past, for the present Duchess is animated by a keen love and respect for the traditions of Chatsworth; and her accomplished head gardener, Mr. J. G. Weston, is a true artist. This writer knew intimately of his work at the once Royal seat in Kent, Eastwell Park, and there, both out-of-doors and under glass, his sense of position and mastery of colour harmonies were unerring. There is enough in what has already been done to show that the restoration of what many will always regard as the most important features of Chatsworth Gardens is in safe hands. W. P. W.

FLORISTS' FLOWERS.

NEW CARNATIONS.

THE following Carnations have been registered with the British Carnation Society:—

Lady Daresbury, delicate rosy-blush; registered by Messrs. Stuart Low and Co., Bush Hill Park.

Lady Lamington, deep cerise; from Mr. Thos. Turnbull, Lamington.

G. F. Philips, crimson-maroon; from Messrs. Hewitt and Co., Solihull.

Blanche, white; from Messrs. C. Engelmann, Ltd, Saffron Walden.

Bath Beauty, buff, marked carmine; from Mr. Charles Wall, Bath.

Petunia, light purple; from Mr. Charles Wall, Bath.

Hermione Hastings, deep salmon-pink; from Mr. T. Turnbull, Lamington.

The Hon. Mrs. Hastings (Fancy), pink, with crimson spots; from Mr. T. Turnbull, Lamington.

Felicity Hastings, claret; from Mr. T. Turnbull, Lamington.

Glorious. This variety, raised by Mr. Charles Wall, of Bath, and which has been in commerce for some time, received an Award of Merit with seventy-six points out of a possible hundred, at Southport Show.

ROSE GARDEN.

BURNET ROSES.

ALTHOUGH the flowering season is comparatively brief, there is a unique charm about the Burnet Rose (*Rosa spinosissima*) in all its forms. It is an admirable species for open woodland, seaside and Heath gardens, and one that will thrive in the poorest of dry, hot soils. The Burnet Rose has produced an enormous number of varieties, ranging in stature from little bushes of a few inches to stalwarts of six feet, while the colour of these, doubles and singles, varies from white or cream to yellow, crimson and those with parti-coloured or striped petals. Most of the Burnet Roses have a fresh and delicate fragrance and the blossoms are succeeded by brown or black fruits.

In addition to the type plant, which is some six inches or so in height, with white, cream or pink flowers, some nurseries send out improved forms up to a couple of feet in height, with blooms of from two to three inches in diameter, and these are borne in the greatest profusion on the slender, arching branches. *R. s. bicolor nana* is a pretty variety with cup-shaped, white blossoms edged with rosy-pink, and one of the oldest and best of the coloured forms is *R. s. var. Miss Colville* (two feet), which has the true Burnet foliage and flowers of a deep crimson. *R. s. var. lutea* is a lovely Rose of about three feet, with a light, open habit and delightful blossoms, two inches across at least, of a rich yellow. *R. s. var. altaica* is the giant of the group, a Siberian form, making a sturdy bush of five feet or even more, and its creamy flowers are fully three inches across. A. T. J.

MESEMBRYANTHEMUM.

(Continued from page 390).

12.—GLOTTIPHYLLUM, HAW.

3. *G. semicylindricum*, N. E. Br., in *The Gardeners' Chronicle*, 1922, Vol. LXXI, p. 22 (Fig. 186).—Leaf-pairs obliquely crossing one another. Leaves very variable, 1-2 (or under cultivation sometimes up to 4) inches long, $2\frac{1}{2}$ -4 lines broad and nearly as thick,

FIG. 186.—GLOTTIPHYLLUM SEMICYLINDRICUM.

Apical part of five leaves, all from one plant, the long lower leaf from a fellow seedling; all natural size. Flowers pedicellate.

half-cylindric, bearing on the flat face beyond the middle two blunt teeth or a transverse hump or ridge across the leaf, the apical part compressed and bluntly pointed or more or less thickened at the tip, light green, soft and pulpy, pellucid-dotted. Pedicels $\frac{1}{2}$ -1 inch long, compressed-terete, 2-edged. Corolla $1\frac{1}{2}$ -1 $\frac{3}{4}$ inch in diameter; petals acute or minutely toothed at the apex, and according to drawings at Kew more numerous and more crowded than those of *G. difforme*. Stigmas, valves and cells of the capsule 8. Capsule (of which about 20 examples have been examined) varying on the same individual from 4-7 lines, and on another plant up to 8 lines in diameter when closed, always with 8 valves and cells, somewhat cup-shaped-obconic, slightly 8-ribbed on the outside, and flattish with 8 slight, gaping ridges on the top, whitish-brown; when expanded 9-14 lines in diameter; valves spreading horizontally, pale brown; expanding keels half as long as the valves, ending abruptly, without an awn or membrane at the tip, light or dark brown; cells deep; cell-wings brownish; tubercles pale brown or whitish. Seeds $\frac{3}{4}$ -line long, somewhat D-shaped in outline, but at the same time wedge-shaped, like a segment of an Orange, tuberculate on the back but not on the sides, brown.

Mesembryanthemum semicylindricum, Haw. *Obs.*, p. 238 (1795), *Misc. Nat.*, p. 86, *Syn. Pl. Succ.*, p. 225, and *Rev. Pl. Succ.* p. 103; Salm Dyck, *Mes.* §7, f. 2; Berger, *Mes. und Port.* p. 232. Founded upon *M. foliis difforme* Dillen. *Hort. Elth.*, p. 252, t. 194, f. 241, which is a reduced figure of the plant. Plukenet, *Almagestum*, t. 325, f. 4, *M. difforme*, Linn. *Sp. Bot.* Vol. XLV, p. 125. *M. bigibberatum*, Haw., in *Phil Mag.*, 1826, p. 328 (not p. 338 as I previously quoted, nor 1824, p. 329, as quoted in

Index Kewensis); Salm Dyck, *Mes.* §7, f. 4; Berger, *Mes. und Port.*, p. 233.

Jansenville Division: Mount Stewart, Pole Evans, 5579! This was in cultivation before 1732.

This is one of the oldest known species in cultivation, and seems to vary very considerably in the size and shape of its leaves, as indicated in Fig. 186. In my previous account of it I was under the impression that the plant figured by Salm Dyck under the names *M. semicylindricum*, *M. difforme* and *M. bigibberatum* represented a different species; but in taking this view I was wrong, for last year my plant of *G. semicylindricum* produced leaves typical of that species and others like those of the plant Salm Dyck has figured under those three names, for as I have previously stated, those different three figures might all have been drawn from the very same individual in different years.

There can, I think, be no question that *M. semicylindricum*, *M. bidentatum* and *M. bigibberatum* are specifically identical, but whether this species is really distinct from *G. difforme* is a point that has yet to be conclusively decided. I have never seen *G. difforme*, as it appears to have died out of cultivation, and from the descriptions of it the only character that appears to distinguish it from *G. semicylin-*

FIG. 187.—GLOTTIPHYLLUM SUBDITUM.
Leaves, adapted from Salm Dyck, Flowers pedicellate.

dricum is that the pedicel is shorter and quadrangular; when re-discovered possibly other characters may be found.

My drawing (Fig. 186) represents the upper part of five leaves, all from the same plant, and part of one leaf (the long, lower one) from another plant raised from seed out of the same seed-pod as that bearing the other five leaves.

4. *G. subditum*, N. E. Br. (Fig. 187).—

Leaves unequal, the pairs obliquely crossing one another, $1\frac{1}{2}$ -3 inches long, 4-5 lines broad, and 3-3 $\frac{1}{2}$ lines thick; the larger leaf of a pair slightly concave above, very convex on the back, the shorter of each pair acute, and the longer prolonged beyond the ridge at the end of the flat part of the face into a compressed and keeled blunt point $\frac{1}{2}$ - $\frac{3}{4}$ inch long, which is slightly incurved, and both leaves are usually curved edgewise to one side, green, pulicid-dotted. Pedicel 5-7 lines long. Calyx compressed, 3-angled, 4-lobed, with the two longer lobes keeled and ciliate on the keel, and the two shorter lobes with membranous margins. Corolla 2-2 $\frac{1}{4}$ inches in diameter; petals in 1-2 series, linear, very obtuse and minutely toothed at the apex. Stamens yellow. Stigmas 10, short, plumose, yellowish.

Mesembryanthemum praepingue, Salm Dyck, *Mes.*, §7, Fig. 5, Berger, *Mes. und Port.*, p. 237, and all other modern authors, but not of Haworth.

Fig. 187 represents the apical portion of two

of the large and one of the smaller leaves of each pair, adapted from Salm Dyck's figure, about natural size.

5. *G. cruciatum*, N. E. Br. in *The Gardeners' Chronicle*, 1922, Vol. LXXI, p. 9 (Fig. 188).—Leaves usually pointing four ways, from the pairs obliquely crossing one another, $2\frac{1}{2}$ -3 inches long, 7-8 lines broad, dilating to 1 inch broad at the very base, curved upwards edgewise, flat or lightly convex, especially near the base on the upper surface, convex on the back, and one leaf of a pair produced beyond the flat surface into a stout compressed and keeled blunt point, often more or less incurved and slightly oblique or twisted, very stout, succulent and soft to the touch, green, with roundish pellucid dots of various sizes. Pedicels about 9-10 lines long and 3 lines or more thick, very stout, subterete but somewhat 2-edged, of equal thickness throughout. Calyx large, 4-lobed; the two outer lobes shorter than the inner, keeled, with thin edges and blunt points; the two inner longer, very broadly membranous, not keeled. Corolla scarcely as large as that of *G. difforme*, ex Haworth, but according to Salm Dyck's figure nearly $2\frac{1}{2}$ inches in diameter; petals "not quite so long as those of *G. difforme*, but broader," ex Haworth, and according to Salm Dyck's figure in 2 series, about 11 lines long and nearly 2 lines broad, obtusely pointed or subacute. Stamens very numerous, short, spreading, yellow. Stigmas 8-9. Capsule small for the size of the plant, tapering downwards, with a hollow or navel at the top, with 8-9 grooved ridges on the top, and with 8-9 valves and cells.

Mesembryanthemum cruciatum, Haw. *Obs.*, p. 173 (1795), *Misc. Nat.*, 35, *Synop. Pl. Succ.*, p. 224, and *Rev. Pl. Succ.*, 100; Salm Dyck, *Mes.*, §8, f. 9 (but not §7, f. 7), not of Berger.

South Africa: Locality unknown; introduced by Masson in 1792, according to Aiton, and if Haworth is right in identifying it with a plant described by Boerhaave it was in cultivation before 1720.

I have not seen this plant. The above description of it is made partly from that of Haworth, partly from an original drawing of the type plant at Kew, which Aiton caused to be made of it,* and partly from Salm Dyck's figure of it. This plate (§8, f. 9) is contained in the Kew collection of drawings, and Fig. 188 is adapted from it, but is missing from some, perhaps most, copies of the book, which is unfortunate, as it undoubtedly represents the true *M. cruciatum* of Haworth, while the plant Salm Dyck also figures as *M.*

FIG. 188.—GLOTTIPHYLLUM CRUCIATUM.
Pair of leaves, adapted from Salm Dyck. Flowers pedicellate.

cruciatum at §7 f. 7 is not at all the same species, differing in its leaves and and much this more slender pedicel. I have described this latter plant as *G. longipes*. N. E. Brown.

(To be continued.)

* The drawings preserved at Kew of the type plants of *Mesembryanthemum* and other genera that were described by Haworth and other authors, were made under the direction of W. T. Aiton, then Director of Kew Gardens, and Haworth evidently knew that they were being made, and undoubtedly alluded to them under *M. canum*, in his *Miscellanea Naturalia*, p. 26 (1803).

PREPARING SOIL FOR CROPS.

TILLAGE operations are of constant recurrence in garden work, their object being two-fold, *i.e.*, to get rid of weeds—which means surface cultivation only, and may be considered as summer routine work—and the pulverisation of the soil to fit it to sustain the plants cultivated for their produce.

At the present season of the year the latter problem, entailing the operations of digging and trenching, with a view to the opening up and pulverisation of the soil to facilitate the preparation of good seed beds and ensure the wide ramifications of roots during the next season of growth, embraces a considerable portion of routine garden work. That deep tillage is of the greatest benefit on all types of soils and an important factor in crop-production is well recognised, and it may be interesting to consider some of the principles which govern this fact.

Deep tillage acts in a marked degree on the drainage by increasing the porosity of the subsoil and allowing the free passage of water to the drains below. It increases to an enormous extent the medium for the ramification of roots in their search for nourishment and thus facilitates feeding over a wide area instead of in a confined space. It allows air to come into contact with a much greater bulk of soil, and exercise its power of decomposing the organic matter in it, which exerts such a powerful chemical as well as mechanical action. A combination of these factors enables us to gain the fullest advantages from the manures we apply to our soils, for the variety of their constituents, consisting of organic and inorganic substances, minerals and salts, would be in a better state to co-operate with any ingredients in the manure used. Physical culture always induces root action, and it is obvious that the greater the root-surface the greater chance the plant has of absorbing what nutriment there is. It also makes easy the thorough incorporation of added manures, without which much of their value is lost. Further, its importance as an aid to chemical action cannot be over emphasised. The well-known chemical law laid down by Berthollet and Jungfleisch, states that "The rate of chemical action is dependent upon the active mass of the reacting constituents." In the case of the plant drawing its nutriment from the soil, the active mass of one constituent is the number of root tips to the plant; that of the other, the amount of nutriment in direct contact with the root-tips.

It is thus clear that the problems of tillage and manuring are intimately related, and that it is impossible to separate them in practice, for the chemical and biological changes which must take place in any soil before its constituents can be rendered available for absorption by the root-hairs of the plant, can only proceed satisfactorily when the soil is in a correct physical condition. It may be noted that although manuring now implies the adding of substances to the soil, it originally meant *man-oeuvre*—to work by hand—and implied only physical culture of the soil, and it is not difficult to imagine that on some soils physical development is even more important than adding manures.

But with an average soil, under a system of intensive cultivation for the production of maximum crops, it is necessary to add manures as well as to physically prepare the soil, and the question naturally arises, how far can one apply manure to the soil in the course of winter tillage without fear of losing its value before the subsequent crops are ready to profit by it? To some extent this depends on the type of soil, for although all ordinary soils possess the power of absorbing organic matter and various chemical compounds from substances applied as manure, the stiffer soils appear to be more effectual absorbents than the sandy ones, hence there is less liability to losses from washing out. Further, light, sandy soils are naturally warmer than heavy, clay land, and as temperature plays an important part in nitrification, this might lead to losses in the light soil which would not occur in the heavy soil.

It would thus appear that, broadly, the time

between the tilling and manuring and the sowing or planting of the next crop may be more in the case of heavy soils than on light soils, and, while it would be good practice to prepare heavy soils during autumn and early winter months, before heavy winter rains increase the mechanical difficulties of tillage, it would be more advantageous to allow an uncropped light soil to grow its natural weeds (or where practicable a green manure crop), so long as growth is active, and defer tillage and manuring operations until mid-winter.

Generally speaking, the manures which are added to soils during winter tillage are of the bulky type, such as farmyard, stable and garden refuse manures. As already noted, the more thoroughly these are distributed through the total soil which is to form the rooting medium of the crop to be grown, the better able are they to nourish the plant as their constituents become available. All these manures are largely composed of cellulosic matter and in such manures nitrogen is the most important element, although they also contain phosphorus and potash and serve as complete plant foods. They should always undergo sufficient fermentation in the heap to break down cellulosic matter before application to the soil, as raw carbohydrates dug into the soil have a deleterious effect on the next crop. Their action is comparatively slow, especially at low temperatures, and they are thus eminently suitable for application to the soil during autumn and winter tillage. Shoddy and feathers can also be dug in during the dormant season, their action being similar to the foregoing.

If it is contemplated to enrich soils in course of preparation by the addition of artificial manures only, and on some soils this is quite practicable, the application of quick-acting manures would naturally be deferred until immediately before or during the period of active growth, but such slow-acting manures as basic slag and kainit should be applied during autumn and early winter, where the use of them is desirable. *W. Auton.*

MARKET FRUIT GARDEN.

It was in keeping with this extraordinary season that October, usually one of the wettest months of the year, should have been amongst the driest. Its rainfall of 1.90 inch was not much more than half the average, and was less than that of any preceding month, except April and May. There was actually a period of nineteen consecutive days without rain. For work on the fruit farm the fine weather was, of course, invaluable. All hands were engaged in picking, packing, and storing Apples and only a few Allington Pippins, the last to be gathered, were left on the trees at the end of the month. All available storage room was filled with Bramley's Seedling. The fruit-store proper was quite inadequate for the heavy crop of this variety, so spaces in some of the buildings were, partitioned off and filled with Apples to a depth of about three feet, the heaps being covered with a layer of straw. The fruit keeps well like this, but the plan is not ideal, because a certain amount of marking and bruising is inevitable. I am informed, however, that there is a distinct shortage of Bramley's Seedling this season, so the variety should pay for storage.

WHY PLANT COOKING APPLES?

This has been a good season for selling anything of high quality in the way of dessert Apples, but a bad one for selling even good samples of cooking Apples. There is no doubt that the proportion of cooking varieties is too great on most fruit farms. I grow about sixty per cent. of dessert Apples, which is probably a good deal more than is commonly found; but even then I have too much ground devoted to such kinds as Lord Grosvenor, Queen, Lord Derby and, worse still, Early Julyan and Domino. Such kinds are almost invariably cheap, and in many seasons they are probably grown at a loss. Even when it comes to a high-class cooking variety like Lane's Prince

Albert, results are none too encouraging. I did not receive more than 6s. per bushel for the best grade of this Apple; and the return per acre was poor compared with that secured even for the despised Worcester Pearmain, in spite of the much heavier yield given by Lane's Prince Albert. Over a series of years, the comparison would be still more favourable to Worcester Pearmain, because it is very regular in bearing, whilst Lane's Prince Albert is one of the most pronounced biennial croppers.

Dessert Apples, if well coloured, free from scab, and properly graded and packed, are always saleable, and they are well able to compete with any imported Apples. The boxed Cox's Orange Pippins now coming into the country from more than one source, are making just about half what I realised for my own boxed Apples of this variety. If only we had one or two good late varieties, I think we could compete throughout the winter with the imported fruit which now holds undisputed possession of our markets at that time. Even with our present range of market varieties, intending planters would do well to restrict the cooking kinds to a few very early and late. Amongst the latter, Bramley's Seedling stands supreme. In the estimation of the public it ranks first amongst cooking Apples, just as Cox's Orange Pippin does amongst dessert sorts. No imported Apple competes with it at all seriously. It has, however, been so widely planted in recent years that storage is almost essential if the highest prices are to be secured. Quite a number of growers have installed cold storage plant mainly with the object of holding this variety until March or April.

POSSIBLE MARKET APPLES.

The need for increasing the number of dessert varieties of Apples grown for market was the subject of a very interesting paper read by Mr. F. Paget Norbury at the conference of growers, held in connection with the recent Imperial Fruit Show. To illustrate his paper, Mr. Norbury had staged a very interesting collection of Apples, old and new varieties, which had been suggested to him as possibly possessing market qualifications. Amongst these, the one which probably attracted most attention was Paroquet, one of the late Mr. Charles Ross's introductions. This has the great merit of being an entirely red Apple, the brilliant appearance of which would be quite enough to sell it. Unfortunately, the flavour is said to be poor. Important as colour is, it would be a mistake for growers to adopt any variety which is not of good quality, for the public are certainly becoming more critical. Many, nowadays, will not buy Worcester Pearmain, and have learned at last to recognise the superior quality of James Grieve, which at one time was difficult to sell.

Two other Apples of very striking appearance in the collection were amongst several sent from Wisley. One of these, George Carpenter, is a new variety, a cross between King of the Pippins and Peasgood's Nonesuch, I believe. The single specimen shown was of good medium size and most attractive colour, the shape being flat-round. If this Apple crops well and is of good flavour it should make an excellent market variety. The other kind was Reinette Rouge Etoilee, a small- to medium-sized fruit of perfect flattened-round shape, coloured carmine with prominent white dots. Nothing more attractive-looking could be imagined, the fruit having a delicate, waxy appearance. I have seen this Apple before in collections, and at one time was keen to plant it; but I was told that it was apt to come too small, and that it is not of very good quality. Unfortunately, quality and fine appearance seldom go together in Apples.

In this collection were Ellison's Orange and Laxton's Supreme, both varieties of good quality which are being planted by market growers. Neither, in my opinion, has enough colour to make it worth serious consideration. What is wanted is a late Apple of brilliant appearance to rival Jonathan and McIntosh Red. It is sometimes said that colour is not of great importance, Newtown Pippin being cited as an

example of a greenish-yellow Apple which is first favourite with the public. But Newtown Pippin has a waxy, sweet appearance, quite different from that of a poorly-coloured English Apple, which suggests sourness. I find that, with the market varieties we already possess, high colour adds about fifty per cent. to their selling value.

VIGOUR IN FRUIT TREES.

I have suggested before in these notes that it is difficult to decide how much vigour is desirable in fruit trees. I mean that it is not easy to say, when looking at the trees, whether they require manure or not. This season, on my place, what might well be considered to be under-vigorous trees have undoubtedly scored, so far as Apples are concerned. These gave fruits of medium size with clear skin and high colour. This was most striking in the case of Worcester Pearmain and Allington Pippin, the fruit of which was too large and lacking in colour from the more vigorous trees. In a dry season the position would probably be reversed. I think, however, that it is desirable not to get dessert Apples too vigorous. Cooking Apples, on the contrary, cannot be too large; and colour is not very important in their case.

I am inclined to think that, with dessert varieties, so long as there is just sufficient movement to ensure spur development, actual shoot growth is not a matter of importance, except of course, in a young tree. Growers who run pigs under their trees have found, in some cases, that this can be overdone. Where they used to keep the pigs on the ground all the year round, they are now running them for short periods only. I have seen one plantation in which duck-keeping has been carried to excess, with the result that the fruits were of very poor colour this season. The best results from pig and poultry keeping are to be seen in Plum plantations, which can hardly be too vigorous. *Market Grower.*

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, Ante pp. 131-137).
(Continued from p. 391.)

WALES.

CARNARVONSHIRE.—The fruit crops generally are a good average here. April and May, being such dry months, the crops suffered badly. June was very wet and cold, and what promised to be a good crop of Strawberries was ruined by the wet. Cherries stoned badly after flowering profusely. *J. E. Higgins, Glynllivon Gardens, Llanwnda.*

DENBIGHSHIRE.—Although Apples promised a good crop and appeared to be swelling freely, the final results are most disappointing, as many of the fruits have fallen badly, especially the varieties Cox's Orange Pippin and Ribston Pippin, which is doubtless due to the cold nights, heavy rains and sunless days, practically the whole of June being of this nature. Strawberries, although good, suffered to a very great extent from the constant and heavy rains, and many of the fruits rotted. The rainfall here for the month of June was 4.30 inches. Many of the plants show signs of deterioration. Black, White and Red Currants, bore heavy crops of good fruits, and Gooseberries also carried excellent crops. Raspberries had a heavy crop, the fruits swelling to an enormous size. The soil, generally, is of a retentive nature. *R. H. Crockford, Horsley Hall Gardens, Gresford.*

—The fruit crops in this district vary considerably. In these gardens we have an average crop of Apples, our heaviest cropping varieties being Bramley's Seedling, Lane's Prince Albert, Red Victoria and King of the Pippins. Pears are scarce but in a garden two miles distant they are plentiful. Plums were a failure, but small fruits were plentiful. Strawberries were an excellent crop, but owing to

continuous rains one-half of the crop was not fit for use. The soil in this district varies from stiff marl in these gardens to gravel a short distance away. The best crop of Pears is on the gravelly soil, and the best Strawberries were on the marl. *J. A. Jones, Chirk Castle Gardens, Chirk, Near Wrexham.*

—Apples carry an average crop of clean fruits; James Grieve, Cellini and Mere de Ménage are very heavily cropped, while Cox's Orange Pippin and Bramley's Seedling are lightly cropped. Court Pendu Plat is a failure. Pears carried a fine display of bloom, but some varieties which set well shed their fruits. Plums looked promising but carried a light crop; Cherries were good, but Peaches, Nectarines and Apricots failed to give an average yield. Black, Red and White Currants carried heavy crops, as did Gooseberries, Raspberries and Loganberries. Strawberries gave good fruits, but the showery weather spoiled many of them. The soil here is very light and shallow and on a sandy subsoil. *S. J. Robbins, Cefn Park Gardens, Wrexham.*

—Although we did not suffer from such severe frosts as were experienced in many parts

good. Plums were a poor crop everywhere and Damsons conspicuous by their absence. Cherries were plentiful in walled gardens along the coast and the fruits of good quality. Peaches and Nectarines gave a poor crop and the quality left much to be desired. Small fruits were about the average and of good quality. Strawberries were a poor crop and small. The frosts of April 28 and 29, and of May 26 and 27 proved disastrous to fruits in all places except along the shore, where the crops are very good in quality, but not up to the average. One would expect aphides and other insect pests to be troublesome in a season such as this, but the fact is they are fewer, and there are very few caterpillars. I have only seen one case of Gooseberry sawfly this year. *Harry E. Jones, County Education Offices, Mold.*

—There was an abundance of blossom on all fruit trees, but owing to the east winds and frosts experienced here on the last nights of April and early May, there was a poor set of Plums and early Apples. Currants and Raspberries have carried exceptionally heavy crops. Strawberries set their fruits well and would have given a good crop, but owing to heavy rains and sunless days during June

FIG. 189.—APPLE SALTNOTE PIPPIN.

of the country during the flowering period, the cold winds and dull weather did much harm, with the result that our fruit crops are light. Small fruits gave the best crops; Strawberries promised well, but continual rain and lack of sun caused many fruits to rot. *F. C. Puddle, Bodnant Gardens, Taly-Cafn.*

FLINTSHIRE.—Apples are finer than for several years past, most varieties bearing very well, excepting Cox's Orange Pippin. Plums were good and the foliage perfect, after being sprayed during winter with Carbokrimp. Pears are a light crop, after a fine show of blossom. Apricots cropped moderately and the trees are healthy, as plenty of rain suits them. Cherries were good, especially the Sweet varieties. Black Currants were splendid and free from aphids. Gooseberries also cropped well. Outside Peaches were good this year, but the trees were badly attacked by Peach blister. Peaches under glass set very freely and carried heavy crops. The Strawberry crop was very good, but the fruits lacked flavour. Damsons have cropped well. The soil here is on clay and suitable for fruits. *Wm. G. Rolfe, Gredington Gardens, Whitchurch.*

—Apples are a fair crop along the sea-board, but inland the crop is poor. The same remark applies to Pears, but the quality of the fruits is

they failed to ripen, and all the best fruits were destroyed by slugs. *J. L. Eversfield, Penbedw Hall Gardens, Nannerch.*

(To be continued).

FRUIT REGISTER.

APPLE SALTNOTE PIPPIN.

HAVING examined specimens of the above-named Apple, I predict a fine future for its pretty and shapely fruits. Specimens were presented for inspection at the meeting of the Royal Horticultural Society on October 11.

Mr. Herbert Chapman informed me the tree was selected from a number of seedlings, grown by an old man employed by him, from pips of Ribston Pippin. The shape of Saltcote Pippin reminds one of Allington Pippin (Fig. 189; see also p. 373). The season of this Apple appears to be round about Christmas time, and although we have a number of varieties in use then, Saltcote Pippin will, I feel sure, be in great demand when better known. The trees of this variety are very productive. I understand from Mr. Chapman that the variety is suitable alike for cultivation as a bush or standard. *Pomona.*

PLUM WYEDALE.

For many years past this Plum has formed a welcome addition to our list of cooking fruits in the early days of November. Twenty years ago, Messrs. Bunyard and Co. catalogued and described it as the "latest of all." Since then I have tested it against many others, and the results bear out their statement. The tree is, perhaps, a little shy in bearing when young, but if grown on a wall and the branches are trained out at a distance of twelve inches apart, and spur-pruned in the usual way, it bears regularly even on a west aspect. The fruit is very handsome, oval, rich blue, and carries a good "bloom," an average specimen weighing about one-and-a-half ounce, just the size most favoured by the cook. The flesh is firm and agreeably acid, the juice when cooked being a deep wine-red. Altogether, it is quite a good cooking Plum, but it is the fact that in most years a dish may be gathered on Guy Fawkes' Day that makes it really valuable. *J. Comber.*

COLOUR IN APPLES.

COLOUR is of the utmost importance in fruits, particularly in dessert Apples. Nothing is more attractive than nicely coloured fruits. Soil, will certainly, to a great extent, influence the amount of colour in Apples; but the colour factor is largely controllable, and the greatest advantage should be taken of the means at hand to increase the amount of colour in the different varieties.

The type of stock on which the Apples are grown has a bearing upon the colour of the fruits. Apples grown on the Crab stock are usually less highly coloured than are Apples on Paradise stock.

Apples grown on grass land are often much more highly coloured than are those grown on cultivated land. The drawback to this method of adding to the colour of the fruits is that unless the trees are comparatively old the quantity and size of the fruits will suffer. By digging annually round the base of the trees, however, the trees may be kept productive and the colouring effect of the grass may be very largely preserved.

Poultry in an orchard add considerably to the colour of the fruit. If a hundred fowls are given an acre of orchard, the effect upon the colour of the fruits will be the same as if the trees had been grown altogether in grass. Poultry have the advantage over grass, as although the colouring effect on the fruits is similar, the fruits are not liable to deteriorate, but the manure will improve the quality and size of the Apples. Fifty fowls to an acre will be sufficient to colour the fruits well, but not sufficient to keep down rubbish.

Ducks and geese have a similar effect to fowls in the orchard, so far as the colour of the fruits is concerned, and are quite as good at keeping down rubbish, although where any quantity is kept the land is apt to become much more messy than with fowls.

Apples on the shady side of a tree often lack colour, while those on the sunny side are well coloured. Assistance may be given to the fruits on the shady side by removing a few leaves from just round them so that a certain amount of sun may reach them.

Needless to say, overcrowded branches should be removed when pruning, otherwise these will have the same effect in preventing colouring as do the leaves which shade the fruits.

There is strong reason to believe that colour is improved by re-grafting, because when trees have been headed back and re-grafted with coloured dessert varieties, the colour of the fruits produced on such trees is mostly excellent, often being superior to that on trees of the same variety previously growing on the land but which have not been re-grafted.

As so many of the factors necessary for the improvement of colour in Apples are controllable it is possible, even on unsuitable soils, to ensure that reasonably well-coloured fruits are produced. Every effort should be made to do so, as the advantages, both from the point of view of attractiveness on the table and in the market, are so considerable. *J. W. Morton, March.*

HOME CORRESPONDENCE.

Blue Tits.—In further reference to the question of the Blue Tit, which I see has been discussed in *The Gardeners' Chronicle*, may I quote briefly from the report on the food of the bird in Dr. Walter E. Collinge's valuable work, *The Food of some British Birds* (1926)? (p. 126) "Of the total food consumed in a year seventy-eight per cent. is beneficial, twelve per cent. neutral, and ten per cent. injurious." (p. 128) "In spite of all that has been chronicled against the bird, the sum total of its activities is distinctly beneficial. The harm it does is comparatively insignificant when compared with the great benefits it confers, and all who foster or aid in its destruction are doing a serious injury both to themselves and to fruit-growers in general." *L. Gardiner, Secretary, Royal Society for the Protection of Birds.*

Superphosphate and Peas.—I should like to warn readers against sprinkling superphosphate along the rows when sowing Peas (as advocated by Mr. Copley, on page 252), as my experience is that many of the seeds will rot if they come into direct contact with the manure. Superphosphate is very slow in action, and to obtain full benefit from its use it should be forked into the soil in winter, after digging. *Grigor Roy, The Gardens, Stoke D'Abernon Manor, Cobham, Surrey.*

Roads of Remembrance.—Would you be so good as to permit the hospitality of your columns for brief outline of a Roads of Remembrance scheme which will interest a proportion of readers belonging to organisations of young people, and especially, we hope, those who live in crowded homes without a garden. With the sanction of both Ministry of Transport and Local Authority, and with the guidance of volunteers who are professional gardeners or expert amateurs they could, by work on Saturdays and holidays, transform into gardens many grass plots of manageable size along each side of the new arterial roads. The choicest flowers and foliage produced under rivalry could be placed round the cenotaph or upon statue or tomb of any national hero whom it may be desired to honour. The favourites of an English garden need no advocacy, but as the claim of trees may be overlooked, we urge the planting of small trees for blossom, foliage, fruit; and large, slow-growing trees, especially the Oak, to carry forward some particular memory to distant time without fear of outrage to any canon of art. What boy who has been cuffed and threatened on suspicion of robbing an orchard would not wish to help in planting along the road miles of Apple, Plum, Pear and Cherry trees? And what person could fail to respond to the beauty of these trees in spring? Beyond formal planting it would be pleasing to scatter the seeds of wild flowers which give most delight, and which, therefore, have such desperate struggle to propagate and survive. Should incidental expenses for travel, tools, plants, trees prove an obstacle to company of poor boys or girls, doubtless these could be met by grants from a central fund, the establishment of which would be fitly considered by a conference called to consider the adornment of arterial roads in the service of the cenotaph and also of other heroes, as channels for the enthusiasm, instruction and health of young people and any of their leaders who may wish to participate. *Richard Rigg (Chairman), Roads of Remembrance Association, 47, Victoria Street, S.W.1.*

Two good Thymes for the Rock Garden.—Of distinctive appearance amongst the rock garden Thymes is *Thymus erectus*. This forms a compact little bush, from six inches to twelve inches tall, all the growths being perfectly upright. The stems, which are woody, bear whorls of small, sweetly-scented leaves, and in late summer produce small, white flowers near the tip. *T. Herba-barona*, a native of Corsica, is unique in having a distinct scent of Caraway and to those who like this it may be recommended. It forms a low-growing clump and bears purplish flowers. *L. T., Maidenhead.*

SOCIETIES.

ROYAL HORTICULTURAL.

NOVEMBER 15.—There was a bright and interesting show in connection with the fortnightly meeting of the Royal Horticultural Society at Vincent Square. The general floral exhibits included Chrysanthemums in quantity, Carnations, hardy trees and shrubs, and a particularly good collection of winter-flowering Begonias. The Floral Committee recommended six Awards of Merit to novelties. Orchids were shown more extensively than a fortnight ago. There were several very attractive collections and the Committee recommended one First Class Certificate and four Awards of Merit to novelties. Half-a-dozen or so seedling Apples were submitted to the Fruit and Vegetable Committee, but none was considered to be superior to the older varieties. The exhibits in the hall included an admirable collection of Potatoes and several good collections of Apples.

Orchid Committee.

Present: Sir Jeremiah Colman, Bt. (in the chair), Mr. Gurney Wilson (Hon. Secretary), Mr. Stuart H. Low, Mr. E. R. Ashton, Mr. Robert Paterson, Mr. John C. Cowan, Mr. J. E. Shill, Mr. Fred K. Sander, Mr. H. G. Alexander, Mr. Arthur Dye, Mr. T. Armstrong, Mr. Frederick J. Hanbury and Mr. Charles H. Curtis.

FIRST CLASS CERTIFICATE.

Cypripedium Chardmoore var. Mrs. Cowburn.—A grand *Cypripedium* of wonderful size. The big, rounded, dorsal sepal is white, with a green base, and the sepals and lip are light Apple-green, with brown veinings. Shown by Messrs. ARMSTRONG AND BROWN.

AWARDS OF MERIT.

Laelio-Cattleya Ishtar (L.-C. Sargon × C. Fabia).—A very handsome hybrid with large, shapely flowers in which the sepals and petals are purplish-mauve and the rounded, frilled lip is purple, with ruby-crimson shading near the golden-veined throat. Shown by Messrs. H. G. ALEXANDER, LTD.

Laelio-Cattleya Yukon var. Unique (L.-C. Schneideri × C. Mrs. Pitt.)—A pretty and very distinct hybrid with flowers of medium size and bright colour. The sepals and petals are vivid cerise, and the lip is similarly coloured at the wonderfully frilled apex, while the side lobes and throat are orange-yellow, and there are orange-red markings under the yellow column. Shown by Messrs. SANDERS.

Brasso-Cattleya Vilmoriniana, Brockhurst var. (Cattleya Mossiae var. Sunset × B.-C. Mrs. J. Leemann).—A big flower, with broad petals and less broad sepals of deep mauve colour. The huge lip is prettily fringed, mauve, with a large, shaded, dull orange area. Shown by FREDERICK J. HANBURY, Esq. (gr. Mr. Farnes), Brockhurst, East Grinstead.

Cypripedium Perseus, Stonehurst var.—A bold flower with a rounded, white dorsal sepal that is shaded with green over the central area and marked with dark purple lines and spots. The petals and lip are green, shaded with purplish-brown, the former having a central band of brownish-purple. Shown by ROBERT PATERSON, Esq., Stonehurst, Sussex.

GROUPS.

Mrs. S. BROWN (gr. Mr. Thurgood), Brownlands, Shepperton, showed a pleasing group of Orchids wherein were good examples of *Lycaste Imschootiana* with thirteen flowers (Cultural Commendation); *Oncidium bicallosum*, *Vanda coerulea*, *Cattleya Ariel*, with a dense spike of purple flowers; *Oncidium varicosum Rogersii*, *Epidendrum vitellinum majus*, *Cymbidium Hanburyanum*, and several *Odontoglossums* and *Miltonias*.

Cattleya Mrs. Gratrix, with lovely white flowers; *C. Aeneas*, gold and ruby coloured; *Brasso-Cattleya British Queen* and *Laelio-Cattleya Cynthia alba* were well shown by Messrs. COWAN AND CO., together with a very fine

selection of *Cypripediums*, including *C. Cavalier*, *C. Bedfordiae*, *C. Eurybiades* var. *Monarch*, *C. Nydia*, *C. Christopher* var. *Grand Duke Nicholas*, and *C. Ponticus*. A very fine *Odontoglossum crispum* was also shown in this group.

In Messrs. STUART LOW AND CO.'s group of Orchids, a specimen of *Vanda coerulea* carried six spikes of pale blue flowers, and there were some capital spikes of *Odontoglossums*. *Cattleya Tityus*, *Brasso-Laelio-Cattleya Thyone*, *Brasso-Cattleya Hanibal*, *Laelio-Cattleya Rhenus*, *Odontioda Queen Mary*, *Oncidium Forbesii*, *Sophro-Cattleya Blackii*, and the rare *Lycaste leucantha*, *Calanthe veratrifolia*, *Epidendrum patens* and *Oncidium Papilio* were well represented.

MESSRS. CHARLESWORTH AND CO. showed beautiful *Odontoglossums* and *Odontiodas*, and fine examples of *Odontonia Pittae* var. *Rosita*, with a spike of eight lilac-mauve flowers; *Miltonia Beau Brummel* var. *superbissima*, with four ruby flowers; *Cynorchis Lowii*, *Coelogyne Mooreana*, with a couple of spikes of its dainty, white flowers; *Phalaenopsis Rimestadiana*, and the pretty *Cypripedium Grace Pitt*.

OTHER EXHIBITS.

Cattleya Bellona, *Brasso-Cattleya Lucida*, *Cypripedium Maudiae magnifica*, and *C. Bellona* were all well shown by Messrs. J. AND A. McBEAN. Mr. HARRY DIXON showed useful *Cypripediums*, *Odontioda Diana* and *Cymbidium Alexanderi* var. *roseum*. BARON BRUNO SCHRÖDER (gr. Mr. Shill), Dell Park, Englefield Green, showed flowers of *Laelio-Cattleya Aconagua* (*L.-C. Schröderae* × *C. Maggie Raphael*), a large and beautiful hybrid. Messrs. BLACK AND FLORY showed *Laelio-Cattleya Edzell*.

Floral Committee.

Present: Section A.—Mr. Henry B. May (in the chair), Mr. J. F. McLeod, Mr. Arthur Turner, Mrs. E. M. Wightman, Mr. H. J. Jones, Mr. J. M. Bridgeford, Mr. W. H. Page, Mr. Wm. Howe, Mr. Donald Allan, Mr. M. C. Allwood, Mr. E. R. Janes, Mr. D. Ingamells, Mr. Courtney Page, Mr. R. Findlay, Mr. James B. Riding, Mr. W. B. Gingell, Mr. D. B. Crane, Mrs. Helen Lindsay-Smith, Mr. Charles E. Pearson, Mr. G. W. Leak and Mr. W. D. Cartwright (Secretary).

Section B.—Mr. Gerald B. Loder (in the chair), Mr. G. Reuthe, Mr. George Harrow, Mr. A. Bedford, Mr. F. G. Preston, Mr. G. Yeld, Mr. E. H. Wilding, Mr. T. Hay, Mr. Hiatt, C. Baker, Sir William Lawrence, Bt., Mr. Charles T. Musgrave, Mr. W. J. Bean, Mr. R. C. Notcutt, Mr. E. A. Bowles, Mr. W. B. Cranfield, Mr. Mark Fenwick, Mr. C. Williams, Mr. James Hudson, Mr. R. W. Wallace, Mr. C. J. Lucas, Sir Herbert Maxwell, Bt. (visitor), and Mr. N. K. Gould (Secretary).

AWARDS OF MERIT.

Acacia Cunninghamii.—Although the seeds were received from Kenya, this is an Australian plant and native of a wide area from central New South Wales to central Queensland. It is the "Kowarkul" of the Queensland aboriginals. Nearly all the *Mimosas* grow rapidly, but this is an exceptionally robust species, for a four-year-old plant has become about thirty feet high under glass at Exbury. It is a very distinct species and, in addition to being very robust, is exceptionally floriferous. The slender, round stems are covered densely with fine, soft, erect, white hairs. The ovate-acuminate leaves are about one-and-a-half inch long, with a maximum width of an inch on the flowering stems. The leaves are of soft texture, entire, margined with tiny white hairs, and of a pleasing silvery-grey appearance. The fluffy balls of bright canary-yellow flowers are borne in axillary racemes on silvery stalks and are deliciously fragrant. Had the Committee recommended a First Class Certificate, we imagine few would have disagreed. Shown by LIONEL DE ROTHSCHILD, Esq. (gr. Mr. A. Bedford), Exbury, Southampton.

Carnation Cattleya Mauve.—A large, fragrant, perpetual-flowering variety of bright rosy-mauve colour. On close inspection it is seen that the broad petals are "dusted" with small carmine spots.

Carnation Maud Allwood.—This is a medium-sized Fancy perpetual-flowering *Carnation*. The general bright orange colour is occasionally replaced by lines of darker colour. There was no appreciable fragrance, but it is a very decorative flower. Both varieties were shown by Messrs. ALLWOOD BROTHERS.

Chrysanthemum Enid.—This is a bright and attractive medium-sized to large Single. The round, shapely flowers are made up of broad, bright chestnut-terra-cotta florets. Shown by Mr. H. SHOESMITH, Junr.

Chrysanthemum Mrs. E. H. Pearce.—This exhibition Japanese variety will be valued by those who desire very large blooms, for they are of immense size. The broad, incurving, pale ivory-white florets are lightly tinted with green. Shown by Mr. E. H. PEARCE, Long Sutton Gardens, Basingstoke.

Chrysanthemum Elsie Crook.—A large Single with several rows of broad florets which reflex attractively at the tips. The colour is an uncommon, deep-cream shade, with a suggestion of peach-pink at the base of the florets. Shown by Mr. G. CARPENTER, West Hall Gardens, Byfleet.

GROUPS.

Mrs. SOFER WHITBURR (gr. Mr. A. S. Gooden), Amport St. Mary's, Andover, set up a large collection of especially well-grown plants of a number of varieties of winter-flowering *Begonias*. The principal varieties were *Pink Perfection*, semi-double flowers of bright colour; *Empress*, double, light scarlet; *Elatior*, rosy-crimson; *Eclipse*, rose-pink; *Dazzler*, rich crimson; *Matchless*, pink; *Her Majesty*, salmon; and *Optima*, pale salmon.

A very extensive collection of sprays of trees and shrubs, mostly berried species, of especial value for late autumn and early winter effect, was contributed by the Hon. VICARY GIBBS (gr. Mr. E. Beckett), Aldenham House, Elstree. In addition to many *Berberises*, *Pyruses* and *Pernettyas*, there was a fairly complete selection of the most decorative varieties of *Euonymus europaeus*, which had especially decorative fruits. The less common items of this large exhibit included the following:—*Hymenanthera crassifolia*, which has whitish fruits studded along sturdy stems; *Viburnum Opulus xanthocarpus*, bearing plentiful bunches of shining yellow fruits; *Celastrus acuminatus*, with its Spindle Tree-like fruits showing scarlet arils; *Ruscus aculeatus hermaphroditus*, with large, reddish-purple fruits; *Billardiera longifolia*, of slender habit and bearing large, blue-purple fruits; and *Cydonia japonica Wilsonii*, which had very large Quince-like fruits. Flowers were provided by a large bush of *Viburnum fragrans*, sprays of *Jasminum nudicaule*, various *Ericas* and *Cydonia japonica* Knap Hill Scarlet, which was also accompanied by fruits. Although not yet in flower, the purplish catkins of *Alnus occidentalis* were highly decorative.

A large floor group of young Coniferous trees and shrubs, arranged by Mr. G. REUTHE, was full of interest to the many lovers of these interesting subjects. Many genera were represented by well-grown examples, and in addition to a good selection of Mexican Pines, *Piceas*, *Abies*, *Cupressus* and *Tsugas*, especially the elegant *T. Brunoniana*, there were small plants of the more tender and lesser-known genera. The last-named included *Dacrydium cupressinum*, *Athrotaxis cupressoides*, *Agathis australis*, and *Taiwania cryptomerioides*. At one end of this admirable exhibit there were a few pots of *Nerines* in good varieties.

A small, but attractive exhibit, arranged by Messrs. L. R. RUSSELL, LTD., included many well-berried bushes of *Skimmia fragrans*, *Tree Ivies*, *Pyracantha Lalandei* and other ornamental shrubs. Mr. JOHN KLINKERT had a good collection of topiary specimens in evergreen Box.

Mr. F. G. WOOD planted a pleasing, low rockery chiefly with grey-foliaged plants which included *Raoulia australis*, *Othonnopsis cheirifolius*, *Teucrium aureum* and *Cineraria maritima*. In his small rock garden exhibit Mr. G. G. WHITELEGG planted goodly patches of *Primula pteroccephala* and *Gentiana sino-ornata*. Miss GLADYS HOWE had miniature rock gardens,

and the Misses HOPKINS had a small rock garden. Messrs. ISAAC HOUSE AND SON continued their exhibits of *Scabiosa caucasica* varieties and also showed several plants of the blue-flowered *Aster grandiflorus*.

Chrysanthemums were shown in quantity and of very good quality. Mr. H. J. JONES had a very large exhibit of admirable blooms of many types. The exhibition Japanese varieties included excellent blooms of *General Petain*, *Majestic*, Mrs. J. S. Kelly, Mrs. R. C. Pulling, *Victory*, *Louisa Pockett*, the new rich yellow *Charles Davis* (1927), and *Lady Young*, of bright purple colour. Chief amongst the Singles were *Delightful*, Hon. Edith Smith, *West Hall Gem* and Mrs. F. Boill. The market-sized varieties were represented by E. Reeves, *Monument* and *Cullingfordii*, of rich crimson colour. There were also several vases of the dainty little *Pompon* varieties, such as *Pygmalion*, rose pink; *Mary Pickford*, white; *Baby Doll*, pale yellow, and *Golden Climax*.

In an attractive collection Messrs. KEITH LUXFORD AND CO. showed good blooms of *Louisa Pockett*, J. Symonds and several good seedlings of the exhibition Japanese sorts. They also staged a vase of very attractive *Anemone* seedlings and a good selection of Singles. Mr. A. G. VINTEN set up a collection of medium-sized varieties, such as *Ondine*, *Enton Sun*, *Golden Marvel* and *Captain Fox*; Japanese, and Susan, *Heroine* and *Exmouth Pink*, Singles. Mr. WILLIAM YANDELL displayed many Decorative varieties, including *Cranfordia*, *Bronze Cranfordia*, *Sunshine*, M. Jules Valet and H. W. Thorpe of the Japanese varieties, and many Singles.

An interesting group of seedling Single *Chrysanthemums* was exhibited from THE MENTAL HOSPITAL (gr. Mr. W. J. Jennings), Napsbury. These were crosses of *Molly Godfrey* and *Sandown Radiance*, and *Bronze Pagram* and *Sandown Radiance*. In nearly every case the former cross yielded tall plants, while from the latter were obtained very decorative and floriferous plants averaging three feet in height. These displayed an interesting variation in foliage type and also bore goodly quantities of very decorative flowers. Mrs. URBAR H. BROUGHTON (gr. Mr. A. W. Evans), Park Close, Englefield Green, had a tastefully arranged collection of cut *Chrysanthemums* in such varieties as Mrs. R. C. Pulling, Mrs. T. W. Pockett, *George Hopkinson* and Mrs. A. Holden.

There were three attractive exhibits of *Carnations*. Messrs. C. ENGELMANN, LTD., included good vases of *Laddie*, *Orange Sunstar*, *Maine Sunshine* and *Citron*, a pretty yellow *Fancy*. Their new varieties, *Cattleya Mauve* and *Maud Allwood*, occupied prominent places in the collection of Messrs. ALLWOOD BROTHERS, who also displayed *Edward Allwood* and *Red Laddie*, of very bright colour. Messrs. STUART LOW AND CO. had large vases of *Daphne*, *Melchett Beauty* and *Duchess of York*, three attractive *Fancies*, and the richly-coloured *Philip Sassoon*. Sweet Violets were shown by Mr. J. J. KETTLE and Mr. BALDWIN PINNEY.

There were many exhibits of paintings of flowers and of garden scenes; the most valuable was the recent collection from the brush of Sir HERBERT MAXWELL, Bt., Monreith, Wigtonshire. This included many artistic and faithful representations of various *Rhododendrons*, *Liliums*, *Buddleia globosa*, *Crinum Moorei*, *C. Powellii*, *Achillea egyptiaca*, *Polygonum cuspidatum* var. *compactum*, *Cistus Loreti* and the fruits of *Iris foetidissima*.

Fruit and Vegetable Committee.

Present: Mr. C. G. A. Nix (in the chair), Mr. William Poupart, Mr. George F. Tinley, Mr. T. Pateman, Mr. W. F. Giles, Mr. E. Neal, Mr. F. Jordan, Mr. H. Markham, Mr. W. H. Divers, Mr. H. V. Taylor, Mr. E. A. Bunyard, Mr. Ed. Laxton, Mr. E. Beckett, Mr. W. G. Lobjoit and Mr. A. N. Rawes (Secretary).

MESSRS. LAXTON BROTHERS, staged a most attractive lot of Apples, the high colouring of the samples being noticeable. Messrs. LAXTON'S two new introductions, *Lord Lambourne* and *Suprb*, were prominently displayed, and it

is apparent that these two new varieties are becoming deservedly popular with both amateur and commercial growers.

Mr. HEMSLEY exhibited a large collection of Apples, which included most of the popular varieties. The quality of the fruits—with few exceptions—was hardly up to the high exhibition standard which recent Apple exhibits have attained.

Messrs. GEORGE BUNYARD AND Co. staged a choice selection of Apples in season. The quality of the fruits left nothing to be desired, and the display was a model of what exhibition fruits should be. Outstandingly good varieties included Cox's Orange Pippin, Charles Ross, Emperor Alexander, King of the Pippins, Peasgood's Nonesuch and Rival.

Messrs. SUTTON AND SONS exhibited a splendid collection of Potatoes, the exhibit comprising some forty-four varieties; twenty-six were immune varieties and two were new introductions. The varieties Dunnottar Castle, Sutton's Epicure, Arran Comrade and Great Scot were shown in superb condition and in greater bulk than the other varieties. The curious salad Potatoes, Pink Fir Apple, Large White Fir Apple and Congo, added novelty to this attractive exhibit.

Messrs. ISAAC HOUSE AND SON sent a few dishes of their highly-coloured Apple John Standish. Mr. H. E. JOLLY, of Kenley, Surrey, sent two seedling Apples to the Committee, but neither showed any improvement upon existing varieties. A seedling Apple from Mrs. W. J. BOWLE, Caldicot, near Newport, was out of condition, being much past its best, so that no opinion could be formed of its merit. Another seedling Apple called Allies Pippin, sent by Mr. A. E. ALLIES, of Alfrick, Worcester, was raised from a pip of a Canadian Cox's Orange Pippin, but the fruit showed no promise of rivalling its parent, either in quality or appearance.

Mr. W. F. LLOYD-JAMES, of Harrowithy-on-Wye, Herefordshire, exhibited a seedling Apple rather after the style of a small Golden Noble, but it was no improvement upon the old-established cooking variety. A small red seedling Apple from Mr. A. A. THOMPSON, Ellesmere, was thought to be no improvement upon existing varieties, and a large green cooking Apple from Mr. HYBERD, of Bromley, Kent, appeared unlikely to displace any one of the several splendid culinary varieties in existence.

Messrs. STUART LOW AND Co. sent a few fruits of the old Sops-in-Wine Apple for the Committee's opinion. The flavour was very good indeed, and the fruits are beautifully coloured.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

At the meeting held on Friday, November 4, the members of Committee present were Messrs. Hy. Astley Bell (in the chair), J. B. Adamson, R. Ashworth, A. Burns, A. Coningsby, J. Evans, A. Keeling, G. V. Llewelyn, D. McLeod, W. J. Morgan and H. Arthur, Secretary.

AWARDS OF MERIT.

Laelio-Cattleya Mrs. Medo, Llewelyn's var.; *L.-C. Mrs. Ethel Rhodes*; *Cattleya Venus*, Orchidhurst var.; and *C. labiata*, Llewelyn's var.—From G. V. LLEWELYN, Esq.

Cattleya Corona Rawdonensis (Hardyana × *Mantini*); and *Cypripedium Louvain*, Bolholt var.—From Captain W. HORRIDGE.

Cypripedium Mrs. H. Arthur (Nirvana × *Lloyd George*); and *C. Puffin* (Demever × *Alcibiades illustris*).—From Mr. JOHN EVANS.

Cypripedium Actaeon (Colin × *Chrysostum* × *Nesta*).—From E. D. BOSTOCK, Esq.

Odontoglossum Martius (Jasper × *amabile splendens*).—From The Hon. G. E. VESTEY.

CULTURAL CERTIFICATES.

To Mr. B. COLLINS for *Odontioda Charles-worthii*, and to Mr. G. V. LLEWELYN, for *Cattleya labiata* Llewelyn's var.

GROUPS.

G. V. LLEWELYN, Esq., staged a group to which a Large Silver-gilt Medal was awarded. The exhibit included *Cattleya labiata*, *C. Venus*, *Orchidhurst* var., *C. Hardyana* and *C. Peetersii*; *Laelio-Cattleya Mrs. Medo*, *L.-C. Mrs. Ethel Rhodes* and *L.-C. Soulangue*; *Cypripedium insigne* var. *Harefield Hall*, *C. Sanderianum*, *C. Berryanum*, *C. Maudiae magnificum*, *C. Eboriacum*, *C. Lord Derby*, *Odontoglossum crispum xanthotes* var. *Acme*, and *Miltonia Bleuana grandiflora*.

Mrs. BRUCE and Miss WRIGLEY, Bury (gr. Mr. A. Burns), were awarded a Silver-gilt Medal for a group containing *Cattleyas Portia*, *C. Mrs. W. J. Whiteley*, *Cypripedium Dreadnought*, *C. Little Gem*, *C. Maudiae*, and home-raised seedlings, with *Oncidium cheiroporum*.

Mr. JOHN EVANS, Colwyn Bay, was awarded a Large Silver Medal for a group that included *Cypripedium Mrs. H. Arthur*, *C. Merlin*, *C. Maudiae*, *C. Lucifer Westonbirt* var., *Odontoglossum Princess Victoria*, *O. Pescatorei xanthotes*, and others.

J. B. ADAMSON, Esq., Blackpool (gr. Mr. J. Howes), staged a group to which a Silver Medal was awarded. This contained *Cypripedium Nabob*, *C. Boltonii*, *C. Rosettii*, *C. Leyburnense*, *C. Thalia* var. *Mrs. F. Wellesley*, and others.

CAPTAIN W. HORRIDGE, Bury (gr. Mr. A. Coningsby), staged *Cattleya Corona Rawdonensis*, *C. labiata albanescens*, *C. Mrs. Pitt* and *C. Portia*, with numerous *Cypripediums*.

The Hon. G. E. VESTEY, Birkdale (gr. Mr. B. Collins), showed *Odontoglossum crispum* var. *Chastity* and *O. c. Maureen*.

Messrs. KEELING AND SONS and Mr. D. McLEOD showed *Cypripediums*.

MARLOW CHRYSANTHEMUM.

The sixth exhibition of this Society was held on Wednesday, November 2, at the Public Hall, Marlow. It was an excellent show, the hall being filled to its utmost capacity with blooms that would have graced the tables of any of our leading exhibitions.

The leading competition in the cut bloom section was for eight vases of Japanese blooms, three blooms of one variety in each vase. Premier honours were won by Mrs. HORNBY LEWIS (gr. Mr. A. G. Friend), who staged large and handsome blooms of good colour and beautiful form. Her varieties were Mrs. P. Murray, R. C. Pulling, T. W. Pockett, Mrs. Carpenter, Queen Mary, Majestic, Mrs. G. Drabble and Red Majestic. Second prize was well won by A. G. BENDIR, Esq. (gr. Mr. G. Clark), who followed closely with handsome blooms; R. C. Pulling (best bloom in the show), Prince Albert and Majestic were varieties in his exhibit worthy of special mention. Captain A. H. B. WRIGHT (gr. Mr. T. Lewis) was awarded third prize for a meritorious set.

Exceptionally good was the class for six vases of singles, six distinct varieties, six blooms in each vase. There was very little to choose between the exhibits. First prize was awarded to Mrs. HORNBY LEWIS, who had a beautifully finished lot of flowers. The varieties in this exhibit were Molly, Bronze Molly, Hon. E. Smith, Phyllis Cooper, R. Collins and Absolute. The second prize was won by LADY VANSITTART NEALE (gr. Mr. J. McCaul), who also had a grand lot of flowers, the better varieties being Sandown Radiance, Bronze Molly, R. Collins and Mrs. H. Woolman. Third prize was awarded to A. G. BENDIR, Esq., and fourth prize to Captain WRIGHT, both of whom showed splendid blooms.

In the class for a display of Chrysanthemums, arranged for effect on a table space five feet by three feet, to illustrate the decorative value of the Chrysanthemum, the two exhibitors made an interesting competition. First prize was easily won by Mrs. HORNBY LEWIS, who staged a great variety of flowers of different types, both large and small-flowered. There were good examples of large Japanese and excellent Singles, all of good form and pleasing colour. Second prize was awarded to C. GLIDDEN OSBORNE, Esq. (gr. Mr. T. E. Jones),

who had smaller blooms. The class for one vase of Incurved Chrysanthemums attracted five entrants. First prize was won by A. G. BENDIR, Esq., who staged handsome blooms of Mrs. P. E. Wiseman; with the same variety, C. GLIDDEN OSBORNE, Esq., was placed second, and with large, unfinished blooms of Ondine Mrs. HORNBY LEWIS was third.

The exhibits were handsome and well-arranged in the class for a group of Chrysanthemums in pots, arranged on a space six feet by four feet. First prize was awarded to Lady VANSITTART NEALE for a beautifully finished group in which were plants grown on single stems in comparatively small pots, each carrying blooms of splendid quality. Second prize was secured by A. R. A. HEATH, Esq. (gr. Mr. J. Pratt), whose arrangement was rather less formal than that of the leading group; Single-flowered sorts were also used. Third prize was won by F. A. BANTOR, Esq. (gr. Mr. W. Clark), who had a neat and even group of excellent flowers.

The chief class in the local division was for twelve Japanese blooms, distinct, shown on boards, for which a Challenge Cup is offered. The Cup and first prize were won by Mrs. HORNBY LEWIS, who had a most attractive and even lot of blooms. The best varieties were Majestic, R. C. Pulling, Mrs. G. Drabble, Red Majestic, T. W. Pockett, Wm. Rigby, Mrs. Carpenter and Queen Mary. A neat and even lot of blooms of good colour and form won second prize for A. G. BENDIR, Esq.; Captain WRIGHT was third.

For a hand-basket of Chrysanthemums, arranged with foliage, berries and grasses, Mrs. FRIEND was a good first with a handsome arrangement of large, golden, single blooms, and a good bronze decorative sort; second prize was awarded to Mrs. BATTING for a very neat basket, and Mrs. A. H. B. WRIGHT was placed third.

For the best decorated table there were four competitors. An interesting display made of a small, crimson, Single Chrysanthemum was the best, and this was shown by Mrs. PLATT; a dainty table of crimson and yellow flowers gained second prize for Mrs. BATTING, and Mrs. FRIEND was placed third.

BIRMINGHAM AND MIDLAND GARDENERS'.

THE fortnightly meeting was held at the Chamber of Commerce on Monday, November 7. Mr. J. Smith presided. The lecturer was Mr. J. Palmer, Manager of the Chad Valley Nurseries (Messrs. W. H. Simpson and Sons), who selected for his subject, "Some New Herbaceous Plants." As Mr. Palmer is well-known there was a full attendance of members to hear him. The subject was dealt with very fully and in a pleasing manner; in fact, it was suggested that the lecture be prepared in pamphlet form with a view to distribution at a nominal charge.

NATIONAL CHRYSANTHEMUM.

At the meeting of the Floral Committee, held at the Royal Horticultural Hall, on November 14, eighteen novelties were submitted for consideration, and the following awards were made:—

FIRST CLASS CERTIFICATES.

Enid. V. 2a.—A handsome and very bright chestnut-terra-cotta Single variety.

Albion. II. 1c.—A very dainty, slightly reflexing, white, decorative variety that promises to be very useful for cutting and for market. Both these varieties were shown by Mr. H. SHOESMITH, Junr.

Mrs. E. H. Pearce. II. 2a.—A very big, loosely-incurving Japanese variety, with broad florets of a green-tinted, white shade, which is very distinct, but not particularly beautiful. Shown by Mr. E. H. PEARCE, Long Sutton Gardens, Basingstoke.

Leicester. II. 1a.—A very effective, bright chestnut Japanese variety, with a golden reverse to the broad florets. Shown by Mr. H. WOOLMAN.

Annie. 1b.—A beautiful silvery-lilac incurved variety with flowers carried on stiff stems. It should prove a very useful market and decorative sort.

Dark Lady. II. 1b.—A medium-sized, decorative Japanese variety of very rich, deep ruby-crimson colour that shows up very effectively under artificial light. Both these varieties were shown by Messrs. CRAGG, HARRISON AND CRAGG.

GLASGOW AND WEST OF SCOTLAND.

THE Annual Meeting of the Glasgow and West of Scotland Horticultural Society was held on Wednesday November 9, when Mr. Thomas Dagg, presided over a large attendance. The financial statement submitted by the Treasurer showed a credit balance of £25 1s. 8d., after wiping off the loss of £185 incurred in 1926. The membership numbered 510 as compared with 532.

Sir John Reed was unanimously re-elected President, and the following amateurs were, on a card vote, added to the Directorate:—Mr. John Bell, Bearsden; Mr. Duncan Cowell, Busby; Mr. J. H. McDonald, Glasgow; Mr. Thomas Nelson, Rutherglen; and Mr. J. G. Roberts, Barrhead.

The Chairman explained that there was little prospect of the Corporation coming in as joint promoters of the Flower Show in 1928, owing to the state of the Common Good fund, and the Society had in consequence made application for the Kelvin Hall. The date of the show would probably be put forward a week.

DERBYSHIRE HORTICULTURAL.

THE twentieth annual Chrysanthemum Show, held in the Royal Drill Hall, on November 3, 4 and 5, opened by Captain J. A. E. Drury Lowe, of Locko Park, was the finest exhibition yet seen in Derby.

There were five miscellaneous groups. The first prize and Gold Medal, offered by H. T. Ann, Esq., Derby, were awarded to Mrs. WALTER EVANS, Darley Abbey (gr. Mr. J. Maxfield), for a display containing Cypripediums, Carnations, Nandina domestica, Liliums, Eulalias and Palms; second prize was won by A. PRESTON JONES, Esq., Mickleover (gr. Mr. J. Bacon), for a wonderful colour scheme in Begonia Optima, excellent Cyclamens, Dracaenas, Grevillea robusta, Eulalias, Nephrolepis todeoides, Adiantums and Kentias; the third prize went to a group from Captain J. A. E. DRURY LOWE, Locko Park (gr. Mr. A. E. Yallop), that contained well-grown plants of Begonia Gloire de Lorraine, Blanche Poitevine Chrysanthemums, Primula obconica, Eulalias and Ferns. Sir WILLIAM BASS, Bart., Berkeley Lodge, Burton-on-Trent (gr. Mr. H. E. House), displayed a charming arrangement in the centre of the hall, composed entirely of Cypripediums and Cattleyas, Plumbago rosea and Grevillea robusta being used for effect. The remaining group was from G. H. STRUTT, Esq., Belper (gr. Mr. J. Tannock), where the finest Kentia in the show was seen, the principal plants in this display being Lilium speciosum Melpomene, Codiaeums, and Coleus.

A rare collection of Orchids, kindly sent by Captain J. A. E. DRURY LOWE, was awarded a Gold Medal, while from the same estate came economic plants, viz., Cinnamon, Banana (Musa Cavendishii), India Rubber, and Derbyshire-grown Lemons.

In the classes for Japanese blooms a very marked advance was noticeable for size, depth and finish of bloom; many new varieties were shown for the first time in Derby. Mr. H. H. TOMLINSON won two Silver Cups in this section.

Single varieties were remarkable considering the early date of the show; the display arranged by J. A. ALTON, Esq., Duffield Park, was awarded first prize and the Silver Cup presented by G. H. STRUTT, Esq.

Keen competition in the fruit-collection classes

provided a most difficult task for the judges; pointing under Royal Horticultural Society's rules resulted in LORD BELPER (gr. Mr. J. McCartney) winning first prize with 42½ points; his opponent, Mrs. WALTER EVANS, gaining 42 points; A. PRESTON JONES, Esq., coming third. Muscat of Alexandria, Alicante and Gros Colmar Grapes were shown in fine condition.

Trade exhibits from Mr. H. WOOLMAN, Messrs. WILLIAM LOWE AND SON, and Messrs. J. M. STEWART AND SON, LTD., were awarded Gold Medals; Messrs. VICKERS and Mr. W. GREGORY gaining Silver Medals.

Unprecedented support was accorded this show by the general public, and though the hall is of large dimensions, it was taxed to its fullest capacity.

The Secretarial duties were carried out this year by Mr. W. Wardman, 5, St. Augustine Street, Derby.

The dates of the next show have been fixed for November 8, 9 and 10, 1928.

ROYAL CALEDONIAN HORTICULTURAL.

THE ordinary monthly meeting of this Society was held at 5, St. Andrew Square, Edinburgh, on November 1, Mr. W. J. Thomson, President, in the chair.

Mr. A. W. Brown, Perth, read a paper entitled, "The Psychology of the Garden," in which he dealt chiefly with the balance of nature as between insects, birds and other beneficial and noxious animals.

Cultural Certificates were awarded to the EDINBURGH PUBLIC PARKS DEPARTMENT for Begonia Optima, and to Mr. J. MILLER for Primula obconica. Messrs. Dobbie and Co., Ltd., exhibited Gloxinias, and Mr. W. J. Scarlett, Inveresk, an Apple-shaped Cucumber. Mr. W. PATTERSON, Clifton Lodge, Murrayfield, was awarded the first prize in the competition for Chrysanthemums, Messrs. WILSON AND Co., Duddingston, being second. In the Celery competition, Mr. JOHN WAUGH, Inveresk Lodge, Musselburgh, was placed first, and Mr. JAMES KEDDIE, Davidsons Mains, second.

READING AND DISTRICT GARDENERS'.

OVER one hundred members assembled at the Abbey Hall, at the meeting, held on Monday, November 7, and presided over by Mr. J. R. Lloyd.

The subject for the evening's discussion was "Violas," and this was introduced in a most practical manner by Mr. M. Goddard, The Gardens, Bear Wood, who stated that Violas and Pansies were familiar to all garden lovers, for they could be grown equally as well in the cottage garden as in large establishments. A short history of the plant was given from the year 1813 until the present time, showing that the aim of the florist was to obtain a flower of perfect outline, with well-defined blotches and margins, great substance of petal and clear deep colour. Many useful hints were given as to propagation and the best varieties were named.

There were some excellent exhibits in the competitive and non-competitive sections. In the latter section First Class Certificates were awarded to the following:—Mr. E. COOPER, Conisborough Avenue, Caversham (and congratulations of the Association), for a very fine batch of seedling Cyclamens; Mr. A. W. GOWER, The Gardens, Calcot Grange, for three vases of excellent blooms of Chrysanthemums Romance, Blanche Poitevine and Mrs. G. Monro; and Mr. F. TURNER, Sunnyside, Calcot, for specimen plants of Blanche Poitevine Chrysanthemums. Awards of Merit were granted to Mr. F. G. RABBETTS, The Gardens, Bulmershe Court, for two vases of Roses, and to Mr. G. CLARK, The Gardens, Dyson's Wood, for two vases of Chrysanthemum Blanche Poitevine.

In Class 1, for a bowl of Chrysanthemums arranged for effect, there were seven entries, the first prize being won by Mr. H. G. LOADER, The Gardens, Aldermaston Court; the second by Mr. A. W. GOWER, and the third by Mr. A. H.

FULKER, The Gardens, Elmhurst, Reading. In Class 2, for a bowl of flowers and foliage, berries allowed, there were four entries. The first prize was won by Mr. J. WYNN, The Gardens, Hammonds, Checkendon; the second, Mr. H. WYNN, The Gardens, Woodcote House; and the third, Mr. A. H. FULKER.

ANSWERS TO CORRESPONDENTS.

BOOK ON FLORAL DECORATION.—D. McK. S. So far as we are aware, there is no book in print dealing with floral decoration.

DESTRUCTION OF OLD TREE STUMPS.—C. R. Statements are sometimes made to the effect that by boring holes one inch in diameter a few inches apart round the margins of tree butts, filling the holes with saltpetre and allowing them to remain for three months, then filling the holes with paraffin and applying a light, the stumps can be burned away. In practice the operation does not act or, at the best, is only partially successful. All that can be done is to grub the butts up; we know of no easy method of destroying them whilst they remain in the ground.

MARKETS.

COVENT GARDEN, Tuesday, November 15th, 1927.

WE cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Tuesday by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in the day.—EDS.

REMARKS.—A few bunches of Roman Hyacinths and Narcissus Soliel d'Or are the newest arrivals in the English flower market. The supplies throughout the cut flower department are considerably shorter than a week

ago and prices are already much higher, especially for Carnations and Roses. The latter are now insufficient to meet requirements. All Chrysanthemums have become more valuable now the outdoor blooms are over. Disbudded blooms and the best lines in bunch stuff have been in good demand. Arum (Richardias) and Lilies are now arriving in good condition and prices are firmer, also for L. longiflorum and L. speciosum album; L. rubrum remains fairly plentiful. Single Violets have arrived in reduced quantities throughout the past week. Amongst Orchids, Cattleyas and Cypripediums have been arriving in large quantities. All French blooms are receiving more attention. Paper White Narcissi, Acacia (Mimosa), and yellow Marguerites are now arriving in much better condition. The newest arrivals during the past week have been Anemones, scarlet Ranunculus, which is very fine in quality; Carnations, Saffron Roses and a few baskets of Tuberoses. Large bunches of Parma Violets have been in greater demand and prices are firmer to-day. Other lines are Eucalyptus, Ruscus, Chilies and Solanum berries. Single Violets have been received, but only in poor condition.

REMARKS.—Some slackening in demand has been noticeable this week, almost all sections reporting quiet conditions. The Apple market is particularly slow, very few deals being negotiated for either English or imported fruits. There is a small inquiry for really top-grade Bramley's Seedling, but buyers are not in the mood to pay higher prices than those which growers would consider moderate. For the time of year, hothouse Grapes are fairly plentiful, with a demand anything but active. A sprinkling of Doyenné du Comice Pears, mainly packed in trays, sell fairly freely, but at low prices, except for a few very choice specimens. English Tomatoes are scarce and dear, and even arrivals from the Canary Islands are realising quite good figures. Cucumbers move very slowly, trade in this section being almost stagnant. Hothouse new Potatoes are another line which is selling badly at the moment. Guernsey Beans, although not selling at very high prices, are going out fairly satisfactorily in spite of rather heavy supplies of Beans from Madeira. Mushrooms are scarce and costly, supplies being restricted, due, no doubt, to the few days of cold weather experienced just recently. Salads, mainly from France, are more abundant and quite

popular. Cauliflowers and green vegetables are selling rather slowly. The Potato trade is steady, and good tubers hold a firm price lead.

GLASGOW.

Although the tone of the cut flower market was firmer at the end of the week, prices of Chrysanthemums continued low, notwithstanding the shrinkage in daily supplies. Phyllis Cooper and Mason's Bronze ranged from 1s. 3d. to 1s. 6d. for 6's; Blanche Poitou, 8d. to 1s.; Pagram 1s. to 1s. 3d.; Peggy, 10d. to 1s.; Jean Pattisson, 7d. to 1s.; La Pactole, 6d. to 1s.; Delores, 6d. to 10d.; White and Yellow Thorpe, 9d. to 1s.; ordinary, 6d. to 9d.; Almirante, 8d. to 10d.; medium, 6d. to 8d.; and Ivy Edwards, 5d. to 8d. per bunch. Carnations were 3s. 6d. to 4s. per dozen. Pink Roses were firmer at 4s. 6d. to 5s. 6d.; red, 1s. 6d. to 2s. 6d.; white, 1s. 6d. to 2s. 6d.; Lilium longiflorum (Harrisi), 3s. to 3s. 6d. per bunch; L. speciosum rubrum, 2s.; Smilax, 1s. to 1s. 6d.; and Asparagus, 9d. to 1s. 6d.

In the fruit market, Apples were more plentiful, and prices were well maintained as follows:—Canadian King Pippins, No. 1, 42s. to 44s. per barrel; No. 2, 34s.; domestic, 35s.; Spy, No. 1, 44s.; No. 2, 40s.; domestic, 32s.; Nova Scotia Kings, No. 1, 30s.; domestic and No. 2, 24s.; No. 3, 21s.; Blenheim Pippin, No. 1, 26s.; No. 2 and domestic, 22s.; No. 3, 18s. 6d.; Wagener, No. 1, 27s.; No. 2, 24s.; domestic, 23s. and No. 3, 20s.; York Imperial, 26s. to 30s.; Ganos, 23s. to 26s.; Jonathan, 15s. 6d. to 16s. 6d. per case; McIntosh Red, 15s. 6d. to 17s. 6d.; Delicious, 20s.; Bramley's Seedling, 20s. per cwt. Grape Fruits were cheap at 16s. per case; Porto Rico Oranges, 20s. per case; South African, 26s.; Sunkist, 38s.; Brazil, 25s. to 26s.; Jaffa, 19s. (144's); Doyenné du Comice Pears, 16s. to 17s. 6d. per half-case; Winter Nellis, 25s.; Beurre d'Anjou, 27s.; Kippen Grapes, 3s. 6d. to 4s. per lb.; English Colmar, 2s. 6d.

Vegetables were steady, excepting Cucumbers, which advanced sharply to 12s. and 14s. per dozen; Cauliflowers, 6s.; Lettuce, 1s. 9d. to 2s.; Endive, 5s.; To atos, 1s. per lb.; and Brussels Sprouts, 2s. 6d. per stone.

THE WEATHER IN OCTOBER.

After October 2, the first half of the month was exceptionally dry, calm and sunny, such winds as there were being mainly from easterly points—the soft, humid, serene variety of early autumn, entirely different to those of spring. Then the weather broke, and the latter half of the month was characterised by very unsettled conditions, under westerly and southerly currents. There was frequently much warmth, however, during both periods, and the mean temperature for the whole 31 days was 51½° or 2½° above the average. Owing to unusually sunny afternoons, the total duration of bright sunshine amounted to 107½ hours, or 10½ hours more than the normal. Rain fell on 17 days, or only one less than usual, in spite of a perfectly rainless stretch from the 2nd to the 12th. The total precipitation was 3.05 inches, or 0.66 inch under the average. Haze, mist and night fogs were unusually prevalent. Slight ground frosts occurred on five dates. A strong gale was experienced on the 2nd, and an exceptionally violent storm during the night of the 28th to 29th, in which a wind speed of 70 miles was recorded, centering at midnight, and in momentary gusts a rate of 96 or 97 miles per hour was attained. The direction was W.S.W. No approximately similar gale of such severity has visited Southport for nearly a quarter of a century. Joseph Baxendell, The Fernley Observatory, Southport.

GARDENING APPOINTMENTS.

Mr. P. W. Ambrose, recently gardener to VISCOUNTS SUMNER, Ibstone House, Bucks., as gardener to Lt.-Col. NICHOLL, Merthyr Mawr, Bridgend, Glamorganshire, South Wales. (Thanks for 2/6 for R.G.O.F. Box.—EDS.).

Mr. Robert Scrimgeour, for the past two years foreman to LORD HAMILTON, at Dalzell, Motherwell, as gardener to Lt.-Col. REID-THORPE, Mandeville Manor, Banbury, Oxfordshire.

Mr. W. G. Sims, for the past four years gardener-bailiff to the late Sir ARTHUR WHINNEY, K.B.E., Lee Place, Charlbury, Oxon, and previously with Col. ASHLEY, M.P., at The Grove, Stanmore, Middlesex, as gardener-bailiff to A. E. FRANKLIN, Esq., Chartridge Lodge, Chessham, Buckinghamshire. (Thanks for 2/6 for R.G.O.F. Box.—EDS.).

Mr. W. H. Ware, late gardener to E. W. Ritchie, Esq., Boxhurst, Dorking, and formerly gardener-bailiff at Broome Park, Betchworth, as gardener to T. F. WHIFFEN, Esq., at Barn Rocks, Aldwick, near Bognor, Sussex.

Mr. C. A. Corke, formerly Senior Instructor, Horticultural section, Sixth Division School, Irish Command as gardener to G. C. LEES-MILNE, Esq., at Wickhamford Manor, near Evesham.

The Seed Potato Industry in Ireland.

IN former years, Ireland was gaining rapidly a reputation for seed Potatoes. Trials carried out in different parts of the country had shown

that Irish seed from suitable districts was little, if at all, inferior to Scotch seed. As a consequence of the growing reputation an export trade of considerable promise began to develop, not only with this country, but so far afield as Malta. During the troubled times of 1916 to 1920, the care required to conduct this trade successfully was not given. Seed of indifferent quality was exported, and naturally the export trade declined. With more settled times the Ministry of Agriculture of the Free State has concentrated its attention on the subject. It is of good augury that they should have done so, for in the first place no Ministry of Agriculture has more drive and capacity, and in the second, the Potato industry in the Free State is one of great magnitude and importance. There are no

fewer than 500,000 acres under this crop in the Free State. Cultivation often reaches a very high level. Crops of twenty tons per acre and over are looked for and obtained by the best cultivators—and as those who know the country are aware, good cultivators in Ireland are very good indeed. Thanks largely to the influence of the Ministry, spraying—an essential accompaniment of Potato-growing in Ireland—is very generally practised, and thanks also to the same influence, the oft-proved fact that no crop responds more surely to artificial fertilisers, is becoming more and more widely applied in practice. It is curious that even though trials and repeated trials have demonstrated conclusively the advantages of certain practices, large numbers of cultivators continue to ignore them. We suppose that few, if any, first-class Potato growers would demur to the statement that a suitable and liberal fertiliser mixture ensures the maximum yield of which a given plot of ground is capable. Such a mixture used by many of the best cultivators consists of sulphate of ammonia, 2½ cwts. to the acre; superphosphate, 4 to 5 cwts. to the acre; and sulphate of potash, 1½ to 2 cwts. to the acre. Yet how many growers, both on farm and garden, if they use fertilisers at all fail to use them on this liberal scale? The Free State then can grow Potatoes well and has many advantages which qualify it to build up a thriving trade in seed Potatoes. Those obscure, but ubiquitous, menaces to successful Potato cultivation, the virus diseases, appear, generally speaking, to have established themselves to a lesser degree in Ireland than in this country. According to Dr. Murphy, who has done so much to advance knowledge of virus diseases of the Potato, it is not infrequent to find stocks of Potatoes grown in Ireland which are entirely free from these diseases. A sympathetic account of seed Potato growing in Ireland, published in the *Journal* of the Ministry of Agriculture of England*, states that one of this group of diseases, namely, Leaf Roll, is not to be found among stocks grown for seed purposes, and that some of the stocks inspected were "practically free from Mosaic," albeit that occasionally both the mild form of this disease and also the more serious form (Crinkle) were to be found. On the other hand, another disease, Black Leg, was fairly prevalent. The Free State Government is promoting the seed Potato industry by means of a scheme which involves inspection and careful roguing, and growers who desire to try Irish seed should take care to purchase seed certified under the scheme. Scotland has won and has deserved to win pre-eminence as the supplier of good Potato seed, but it is well for growers generally that there should be another source available: for progress is the echo of the clash of competition.

R.H.S. Gardeners' Diary for 1928.—The handy *Gardeners' Diary* for the coming year, published for the Royal Horticultural Society by Messrs. Charles Letts and Co., and edited by Mr. F. R. Durham, is now available. As usual, the diary contains a large amount of information, useful alike to amateur and professional gardeners. It contains planting tables, tables of weights and measures, dates of the R.H.S. meetings, lists of the R.H.S. publications, remedies for the pests and diseases of plants, and pages for memoranda. Copies may be obtained post free for 2s. 2d. from our Publishing Department, 5, Tavistock Street, W.C.2.

Mr. W. Auton.—We feel sure that our many readers will be pleased and interested to learn that Mr. W. Auton has been appointed Garden

Superintendent at the Nitram Research Station and Experimental Farm, Jealott's Hill, Warfield, near Bracknell. For many years Mr. Auton has been gardener to Lord Elveden (now Lord Iveagh), at Pyrford Court, Woking, and quite recently he paid a visit to the West Indies on behalf of Adco Ltd. He has had a wide and varied experience, gained in France and Germany as well as in England, and as he is particularly interested in experimental work, we feel sure he will be successful in the new position which he takes up on December 15.

National Dahlia Society.—The annual meeting of the National Dahlia Society will be held on Tuesday, November 29th, 1927, at 4.15 p.m., in the Royal Horticultural Hall, Vincent Square, Westminster.

Red Squill as a Rat Poison.—The Ministry of Agriculture* recommends the use of Red Squill poison for the destruction of rats and mice, particularly in places where there are poultry, live-stock, domestic animals or stored food. Red Squill is an extract from the bulb of *Urginia maritima*, a plant growing on the sandy shore of the Mediterranean. It should be used in powdered or liquid form in baits composed of bread (or oatmeal), fat, syrup and a few drops of aniseed. It may also be obtained ready for use in biscuit form. The latter, which is very effective, must be fresh, and the biscuits, broken, if necessary, must be put in place with a gloved hand, for otherwise the bait is apt to be refused.

The Use of Sulphate of Ammonia on Golf Greens.—The experiments at Stoke Poges on the use of sulphate of ammonia on golf greens, described on page 61, have now been in progress for some seven months and are being continued. The results obtained are proving of considerable interest, and will be described in a forthcoming issue of this journal.

Veteran German Horticulturist.—Herr Hermann A. Hesse, the well-known German nurseryman, of Weener, Ems, has just celebrated (November 14) his seventy-fifth birthday, "in volle Frische" as the phrase runs, or, as we should say, in full health and vigour. Born of a horticultural family, Herr Hesse began at a very early age to follow the profession of a nurseryman, specialising a little later in trees and shrubs. He went to various places in the pursuit of knowledge, including Paris and other parts of France, and also England, where he visited Thomas Rivers' nurseries in 1879. In the autumn of the same year he opened his present nursery establishment at Weener, though he was warned by all his friends that a nursery in East Friesland would never succeed. By means of talent and perseverance, however, the venture was made a success, and gradually assumed the immense proportions of the present time. So far as trees and shrubs are concerned, it may be stated that what cannot be obtained from Herr Hesse is not to be found in Germany at all. Herr Hesse has the distinction of being a Kommerzienrat; he is unmarried, and has made over the active management of his huge business to his five nephews, while he himself has retired to a property not far from the nurseries where he still cultivates the subjects which have been his life-long passion.

Almond Industry in Majorca.—In a very interesting account of agriculture and horticulture in Majorca, contributed to the current issue of the *Kew Bulletin*, Mr. W. Dallimore makes special reference to the Almond industry of the island. He states that: "The most important crop of the island is undoubtedly the Almond. Of this a large number of varieties are cultivated. There is a doubt, however, as to whether many of these varieties are distinct and whether one variety may not be known under different names in different districts. This is one of the problems that Don Filipe Fuster Rosenol is setting himself to solve. He intends to collect all the named sorts and, if possible, reduce the number by grouping those that are alike under one definite name. A

**Journal of the Ministry of Agriculture*, Vol. xxxiv, No. 7, October, 1927.

great deal of trouble is taken with the cultivation of Almond trees. In some cases they are planted in orchards many acres in extent, in others a few trees are grouped on a small terrace held up by stone walls. In almost all cases the trees are widely spaced and it is unusual for the branches of two trees to meet. The ground beneath the trees is cultivated, and from it a crop of Broad Beans or Corn is taken during the winter and spring months. It lies fallow during summer and is ploughed as soon as the Almonds are gathered. Both chemical and farmyard manures are used as fertilisers, and in many places the land appears to be on the poor side. Very often the orchards are composed entirely of Almonds, but in some there may be a mixture of Almonds, Olives, Carobs, or Figs. Mixed orchards are more common on the higher land than on the plains. When the Almonds are ripe they are knocked off the branches by means of long Bamboo poles and are then picked up by women and children. After drying in heaps, the Nuts are separated from the husks, and the shells are then broken either by hand or machinery and the kernels extracted. The different forms do not appear to be kept separate in the gathering and shelling, but the kernels are graded for marketing. There appears to be little waste in the island. The shells of the Almonds even are carefully saved and used for burning for heating purposes. As soon as the crop is gathered the trees are carefully pruned, all inside wood and broken branches being cut away. All prunings are kept, tied in faggots, and used in the bakeries. The same pruning is carried on with Olives, Carobs and Figs, thus a tree with a dense head is rarely seen. When a large Almond branch is broken it is cut off and grafts are inserted the following spring. The trees are usually between twenty and thirty feet high, and always standards with trunks five or six feet high. Most of the trees are said to be white-flowered. So prosperous is the Almond industry at the present time that as old Olive trees die they are replaced by Almonds, and several newly-planted fields of Almonds were noticed on land recently reclaimed from the wild mountain side. A good deal of trouble is taken in preparing places for new trees. Old trees are grubbed up by the roots and holes four to five feet across excavated for the coming planting season."

Legacies to Gardeners.—Mrs. Anna Mary Rodger, of St. Andrews, Wimborne Road, Bournemouth, who died on October 7, bequeathed £200 to her gardener, Mr. J. W. Payne, "in remembrance of my late husband."—Mr. R. K. Sampson, of Elm Court, Ringmer, Sussex, who died on July 12, left £100 to his gardener, Mr. J. Sales, if still in his service.

Potato Erstling.—A contributor to *Moller's Deutsche Gartner-Zeitung*, of November 11, writes enthusiastically of a Potato named Erstling, which appears to be the earliest of all "garden" varieties, as, with ordinarily good cultivation, it yields, as early as June 20, a good crop of saleable Potatoes. The flesh is yellow in colour, the eyes flat, the form a round-oval; flavour and cooking qualities excellent. The foliage is short, so that the variety is eminently adapted to cultivation in a cold frame, and by this method tubers the size of a hen's egg may be obtained in the middle of May. The variety is said to be little known, as it only came into commerce last year, but curiously enough, it is stated to have originated in England. If this is so, it can scarcely have been named here, or must have been re-christened for the German market. In Holland it is also becoming popular. Its great advantage lies in the fact that as it crops early the ground becomes available for a succeeding vegetable crop.

A Commemorative Forest for Palestine.—It has been decided to plant a large forest in Palestine to commemorate the fourteenth anniversary of the Balfour Declaration. This forest, which is to be known as the Balfour Forest, is to be on an extensive scale and, at least, fifty thousand young trees of various sorts will be planted. This work is expected to help the development of Palestine by improving

the amenities and creating new industries. The entire cost will be borne by the Jewish National Fund.

Mr. James G. Quinn.—For many years Mr. James G. Quinn, gardener to Captain R. B. Brassey, at Cottesbrooke Hall, Northampton, has excelled as a cultivator of Chrysanthemums and fruits, and this season he won the Holmes Memorial Cup for Japanese Chrysanthemums at the National Chrysanthemum Society's exhibition. Like so many other successful gardeners, Mr. Quinn began his horticultural education under his father, in this case at Little Houghton House, where he stayed about four years. He then went to Audley End, Saffron Walden, serving under Mr. J. Vert, and gaining a large and varied experience with plants and fruits grown under glass. Anxious to gain further experience, he next obtained a post as journeyman, under glass, at Cranfield Court, Bedfordshire, where Carnations and Chrysanthemums were grown particularly well. Two-and-a-half years later, he left Cranfield and became foreman at Hinchingsbrooke, Huntingdon, where the gardens were well-kept and improvements were often being

MR. JAMES G. QUINN.

made. His next position was that of foreman and decorator at Birr Castle, Kings County, Ireland, where a good collection of plants was grown, but his stay in the Green Isle was very brief, for after about nine months he was offered the post as foreman under glass at Castle Ashby, Northampton, under Mr. A. R. Searle. The glass department at Castle Ashby was extensive, plants and fruit being grown in large quantities, both for home use and for exhibition, consequently the experience gained during his two years' stay has been of great value. On leaving Castle Ashby he became general foreman at Longleat, the seat of the Marquis of Bath, which is noted for its extensive vineries and fine Grapes. Decorations were also a feature, plants in great variety and quantity being grown for that purpose, especially stove plants. Five years later, Mr. Quinn became gardener to Captain R. B. Brassey, whom he has served for the past seventeen years, at Copse Hill, Bourton-on-the-Water; Heythrop Park, Chipping Norton; and Cottesbrooke Hall, Northamptonshire, the greater part of the time being spent at Cottesbrooke. Since he came to Cottesbrooke the garden has been re-made and a new range of glass erected. Outstanding features at Cottesbrooke are the Shrub Garden and the Wild Garden, and these have been developed during the past seven years. These occupy a long, narrow stretch by a brookside, a space formerly covered with scrub and weeds. During the past seven years, Mr. Quinn has taken a keen interest in exhibiting, and has met with

considerable success, gaining many prizes and several cups for Chrysanthemums, Sweet Peas, fruits and vegetables at various Shows, including the National Chrysanthemum show, the National Sweet Pea Show, R.H.S. Fruit Show, and Northampton, Bedford, Oxford, and Nottingham Chrysanthemum Shows.

Elm Disease in Belgium and Holland.—We learn with regret that many of the beautiful Elm trees which formerly adorned the outer boulevards of the city of Brussels have perished of disease, and it is proposed to replace them by a hardier kind of tree, probably by the Plane. In Holland, where Elms are used for a similar purpose, there has been a similar experience, and a number of remedies have been tried at Rotterdam, Wageningen, and the Hague, with little or no success. In the latter town it is calculated that three-hundred-and-fifty trees have died, or are at the point of death, this year alone, and it is proposed to cut them all down, and to refrain for the future from planting Elms in public places.

Chrysanthemums at Roath Park, Cardiff.—At the present time the Chrysanthemum show at Roath Park is a source of pleasure to a large and interested public. The plants are very tastefully staged in a long, span-roofed conservatory. Very few large, Japanese varieties appear in the group, but the effect does not suffer; indeed it is gratifying to observe how beautiful a group of well-grown Decorative sorts and Singles may be. In some instances the varieties of these sections have been disbudded, in others the sprays have been allowed to develop in a natural manner. The following varieties are worthy of special mention:—Cranfordia, Jean Pattison, Octobre, Market Red, Rev. W. E. Catlow, Mrs. Gelly, Miss Joyce Strowler, K. Bowman, Patching, Florrie King, Mrs. G. Monro, Edith Cavell, F. A. Tofield, F. W. Ladds, F. Townsend and W. Turner. The Chief Officer of Parks (Mr. A. A. Pettigrew), has provided a beautiful display and given pleasure to thousands of the citizens of Cardiff.

November Flowers in an Oxfordshire Garden.—Mr. J. Butler, Rose Cottage, The Moors, Kidlington, sent us a box of beautiful flowers, with the following note:—"I am sending to-day (November 8) a box of miscellaneous flowers, principally Roses. The yellow cluster Rose named Danae, so seldom mentioned, is well worth a more prominent position; it is a strong grower and always in flower; with me it commenced to flower in May and has never been out of flower up to the time of writing, and even now it is full of flower buds. I have plants six feet to seven feet high, which have been a striking feature in my front garden all through the summer. If carefully pruned, this Rose makes a splendid pyramid, and when in full flower is a very noble plant. In another part of the garden Danae makes a splendid hedge, and I am planting Moonlight for the same purpose. I am inclined to think Pax would also adapt itself to hedge-cultivation. What a splendid Rose is Madame Butterfly; I have placed this at the top of my list of dwarf Roses; it has shapely blooms, its habit is good, and the foliage fine. Flowers of Madame Abel Chatenay, Lady Pirrie, Independence Day, and many others are sent, and all have been excellent this year. Hugh Dickson, I find, does best with me if allowed to ramble. I intended to send a bunch of double and single Begonias and also two varieties of Dahlias, but we had a sharp frost on November 7 which finished them. Mignonette Sutton's Glant I cannot speak too highly of. The Hydrangeas I have in tubs, stood outside, are flowering for the second time. I am sending a few heads of bloom. The variety Bouquet Rose has gone out of flower; Emile Mouilliere promises to be a good subject when it gets stronger; both these are now planted outside, and if they survive the winter, doubtless they should be excellent next year."

Association of Parks and Botanic Gardens Superintendents.—Many of our readers will be pleased to learn that a meeting under the auspices of the London and District Branch of

the above association will take place in the Lecture Room of the R.H.S. Hall, Vincent Square, on Tuesday, November 29, when an address will be given by Mr. W. W. Pettigrew, General Superintendent of the Manchester Parks, on the "Aims, objects and advantages of the Parks Superintendents Association." The chair will be taken by Mr. A. J. Ashmore, of Peckham Rye Park, at 7.30 p.m., precisely.

Ghent Quinquennial Show, 1928.—Preliminary arrangements for the next Ghent Quinquennial Exhibition were made at a meeting held in the Palais des Floralies on Sunday last. British, French and Dutch representatives were present, together with M. Charles Pynaert and M. F. Spae, respectively President and Chairman of the Foreign Sections; M. Lucien de Cock, General Secretary, and M. Henri de Wilde, Designer and Director of the exhibition. The several sites and spaces were selected for the

in the large hall of the Teachers' Union in Alexanderplatz. The ceremony was followed by the exhibition of a film of horticultural interest.

Chrysanthemums at Oak Hill Park, Accrington.—Abundant evidence is reaching us of the popularity of displays of Chrysanthemum now provided by the public authorities in various parts of the country. A large conservatory at Oak Hill Park, Accrington, is at present filled (Fig. 190) with these attractive autumn flowers, and the exhibition is attracting thousands of visitors. Many of the best varieties of recent introduction are grown, and prominent sorts represented by especially fine blooms include Ajax, Autumn Tints, C. Davis (new yellow), Belle Chinoise, H. J. Jones, Julia, Red and Yellow Majestic, Marjorie Woolman, Mrs. A. Holden, Mrs. E. Sweet and James Baxter. Mr. H. Boyd, the Superintendent, has not only grown these Chrysanthemums skilfully but

dry repeated dressings may prove destructive, but it will be found that even when it is in a dry state, they can escape with their lives, casting off a coating of slime, with the dry lime sticking to it. A trial of a few thrown into a pot containing dry quick-lime will confirm the accuracy of this statement. To bury them stirred up with it is, we admit, sufficient to "settle" them. We know of nothing better calculated to eradicate them than in autumn to lay thin slices of fresh Turnip hollow, by placing one end on a stone, or concave, Cabbage or Savoy leaves laid amongst crops infested with them, or elsewhere (by the side of paths is most convenient), examining them on a mild and moist evening, two hours after dark, or at day-break; thousands may thus be secured, and if repeated occasionally they may be extirpated altogether, from either the garden or the farm. In spring, where a pond or brook is at hand a brood of young ducks will devour them in good earnest, but they must be trained

FIG. 190.—CHRYSANTHEMUMS AT OAK HILL PARK, ACCRINGTON.

foreign sections, and we believe that in each case the sites will be entirely different from those occupied five years ago by the British, French and Dutch horticulturists. After the meeting, the representatives were entertained to lunch by the Comte André de Kerehove, President of the Ghent Society and Governor of West Flanders. We understand that His Majesty the King of the Belgians will be an exhibitor in April next, and will open the exhibition, and that the Lord Mayor and Sheriffs of the City of London propose to visit Ghent on the occasion of the Floralies.

Front-Garden Competition in Berlin.—The competition for the best and most attractive front garden, which was organised in Berlin this year, has been a great success, and has resulted in a considerable improvement in the appearance of the residential quarters of the city. Ten special prizes, two hundred first prizes, and about two-hundred-and-fifty certificates have been awarded; the prize-giving ceremony took place on Sunday, November 13,

he has arranged them in a very attractive and pleasing fashion.

Appointments for the Ensuing Week.—**MONDAY, NOVEMBER 28:** National Chrysanthemum Society's Floral Committee meets; East Anglian Institute of Agriculture's lecture. **TUESDAY, NOVEMBER 29:** Royal Horticultural Society's Committees meet; National Dahlia Society's annual meeting. **WEDNESDAY, NOVEMBER 30:** London Gardens Guild lecture; Iris Society's annual meeting and dinner. **THURSDAY, DECEMBER 1:** Linnean Society's meeting. **FRIDAY, DECEMBER 2:** Accrington and District Chrysanthemum Society's meeting. **SATURDAY, DECEMBER 3:** Blackburn and District Horticultural Society's meeting.

"Gardeners' Chronicle" Seventy-five Years Ago.—*Destroying Slugs.*—It has been represented that quick-lime strewed in rainy weather is effectual in destroying slugs; this is, however, a mistake, inasmuch as they will escape from it when it is in a wet state, with but little trouble; it will then only annoy them. If the weather is
